REPORT

ON THE

CENSUS OF THE PUNJAB

1931.

CHAPTER I.

DISTRIBUTION AND MOVEMENT OF THE POPULATION.

SECTION 1.—THE AREA DEALT WITH.

1. Introductory. 2. Administrative Divisions. 3. Natural Divisions. 4. External changes in boundaries. 5. Internal changes. 6. Area figures.

SECTION 2.—POPULATION.

7. General. 8. The "Census." 9. Provisional totals.

SECTION 3.—AREA, POPULATION AND DENSITY.

10. Density. 11. Density in Administrative Divisions. 12. Density in Districts and States.

SECTION 4.—VARIATIONS IN POPULATION.

13. Past Censuses. 14. Variations in population (1855—1921). 15. Conditions of the previous decade (1911—1921).

SECTION 5.—CONDITIONS OF THE LAST DECADE.

16. General. 17. Health conditions. 18. Hospitals and Dispensaries. 19. Definitions. 20. Agricultural conditions. 21. Agriculture. 22. Improvement in methods of Agriculture. 23. Fruit Orchards. 24. Use of improved implements. 25. Agricultural stock and its care. 26. Horse, Mule and Cattle-breeding. 27. Prevention and Treatment of cattle diseases. 28. Irrigation. 29. Sutlej Valley Project. 30. Trade. 31. Industry. 32. Two new sources of wealth. 33. Joint Stock Companies. 34. Wages. 35. Prices. 36. Road communications. 37. Railway transport. 38. Post Office, Telegraph and Telephone services. 39. Co-operative movement. 40. Education. 41. Panchayat system. 42. Rural up-lift. 43. The Mandi Hydro-Electric Scheme. 44. Broad-casting.

SECTION 6.—MOVEMENT OF THE POPULATION.

45. Increase in population. 46. The causes of the variation in population. 47. Natural increase, births and deaths. 48. Age distribution. 49. Sex proportion. 50. Influence of religion on the movement of the population.

SECTION 7.—MOVEMENT IN SMALLER UNITS.

51. Movement in Natural Divisions. 52. Movement in each British district. 53. Pressure on resources. 54. Movement in Punjab States. 55. Accuracy of census figures.

SECTION 8.—HOUSES AND FAMILIES.

56. General. 57. Definition of census house. 58. Number of persons per house.

SECTION 1.—THE AREA DEALT WITH.

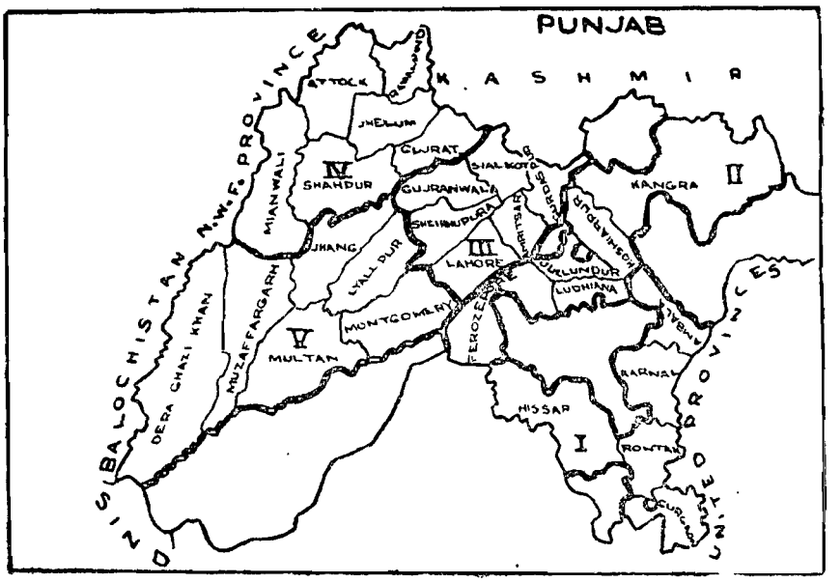

Introductory.

1. This Report deals with the eighth Census of the Punjab, taken on the night between the 26th and 27th February 1931. A separate Report for Delhi Province, which has hitherto been treated in the Punjab Reports, has been compiled on the present occasion.

The Province derives its name from its rivers (*Punj-ab*, meaning five rivers), namely Sutlej, Beas, Ravi, Chenab and Jhelum, which traverse its length from north-east to south-west and join up with the Indus at Mithankot (in the Dera Ghazi Khan District) and thus along with it pour their waters into the Arabian Sea near Karachi. Four decades back it was the existence of the five rivers rather than their utility, which conferred the name on the Province. Now those rivers do not merely exist in name, but have been rendered a valuable asset by the engineer's skill, and all of them have to their credit magnificent canal systems, which have brought fertilising water to millions of acres of arid land and thus provided livelihood for a considerable portion of the provincial population, and have brought into existence prosperous colony towns and flourishing villages, built on modern lines with due regard to the laws of sanitation and cleanliness. The Beas is the smallest and the only river, whose name is not directly associated with a canal, but during the *kharif* it feeds an old private canal in the Hoshiarpur District, known as Shah Nahr, and after joining the Sutlej near Ferozepore, its supply is utilized by the canals of the Sutlej Valley Project. At the last census, the Sutlej had only one canal, the Sirhind, to feed, but now it claims a most extensive canal system, which irrigates large tracts in the Ferozepore, Lahore, Montgomery and Multan Districts and the States of Bahawalpur and Bikaner. Thus the Punjab is now in reality a tract, which in a way derives its life from those rivers, depending on them largely for its material prosperity. Two other rivers, the Jumna and the Indus, also traverse the Province and form its boundaries on the east and west, respectively. The Jumna divides the Punjab from the United Provinces, and the Indus while forming the boundary line on the north-west runs through the Mianwali District and separates the Dera Ghazi Khan District from the rest of the Province.

Administrative Divisions.

2. The Province is administratively divided into two parts, the British Territory and the Punjab States. The former has an area of 99,265 square miles or 72·5 per cent. of the total area of the Province, and an enumerated population of 23,580,852 or 82·8 per cent. of the total population. As at last census, the British Territory is divided into 29 districts, each administered by a Deputy Commissioner, and these are grouped in five divisions, each in charge of a Commissioner. The map in the margin shows the limits of the districts and divisions. The order in which the

Political Divisions.

I. Ambala Division. II. Jullundur Division. III. Lahore Division.
IV. Rawalpindi Division. V. Multan Division.

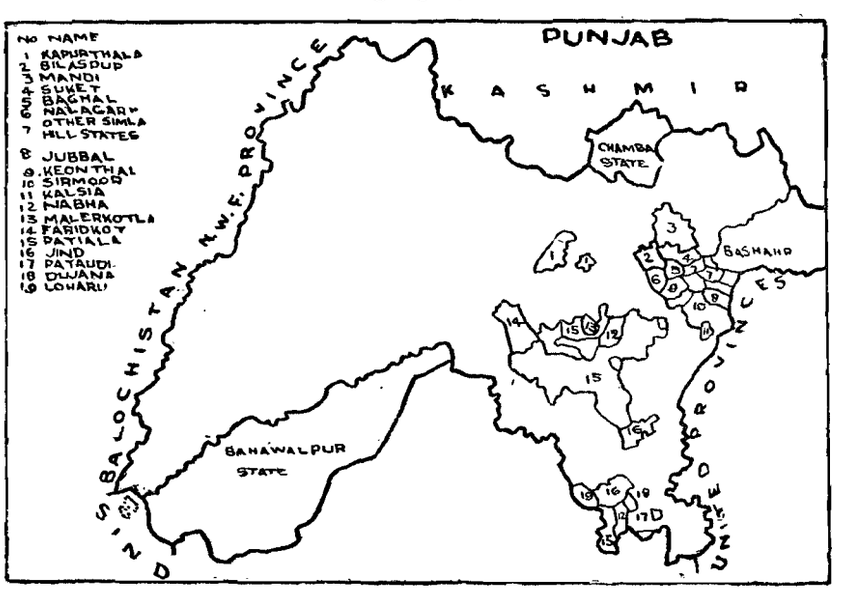

administrative divisions of the British Territory appear in the census tables and official documents is shown below :—

Ambala Division.	*Jullundur Division.*	*Lahore Division.*	*Rawalpindi Division.*	*Multan Division.*
1. Hissar.	7. Kangra.	12. Lahore.	18. Gujrat.	24. Montgomery.
2. Rohtak.	8. Hoshiarpur.	13. Amritsar.	19. Shahpur.	25. Lyallpur.
3. Gurgaon.	9. Jullundur.	14. Gurdaspur.	20. Jhelum.	26. Jhang.
4. Karnal.	10. Ludhiana.	15. Sialkot.	21. Rawalpindi.	27. Multan.
5. Ambala.	11. Ferozepore.	16. Gujranwala.	22. Attock.	28. Muzaffargarh.
6. Simla.		17. Sheikhupura.	23. Mianwali.	29. Dera Ghazi Khan.

The Punjab States have an area of 37,699 square miles and a population of 4,910,005, or 27·5 per cent. of the total area and 17·2 per cent. of the total population. The Simla Hill States are 27 in number, and their grouping remains as before and the Deputy Commissioner, Simla, continues to be their Superintendent. These and three others (Pataudi, Kalsia and Dujana) have political relations with the Punjab Government, and 13 states have political relations with the Government of India through the Agent to Governor-General. Their arrangement in the tables is shown below :—

A.—Having political relations with the Punjab Government.	*B.—Having political relations with the Government of India.*		
1. Dujana.	5. Loharu.	12. Faridkot.	
2. Pataudi.	6. Sirmoor.	13. Chamba.	
3. Kalsia.	7. Bilaspur.	14. Patiala	Phulkian States.
4. Simla Hill States (27 states).	8. Mandi.	15. Jind	
	9. Suket.	16. Nabha	
	10. Kapurthala.	17. Bahawalpur.	
	11. Maler Kotla.		

This arrangement depends on the closeness of their relations with the Province and also on their geographical position, but not on the importance of their size or status. In the last Census Report Nahan appeared as the name of the Sirmoor State ; as a matter of fact the name of the State is Sirmoor and Nahan is its capital. The map in the margin indicates the location of the various Punjab States.

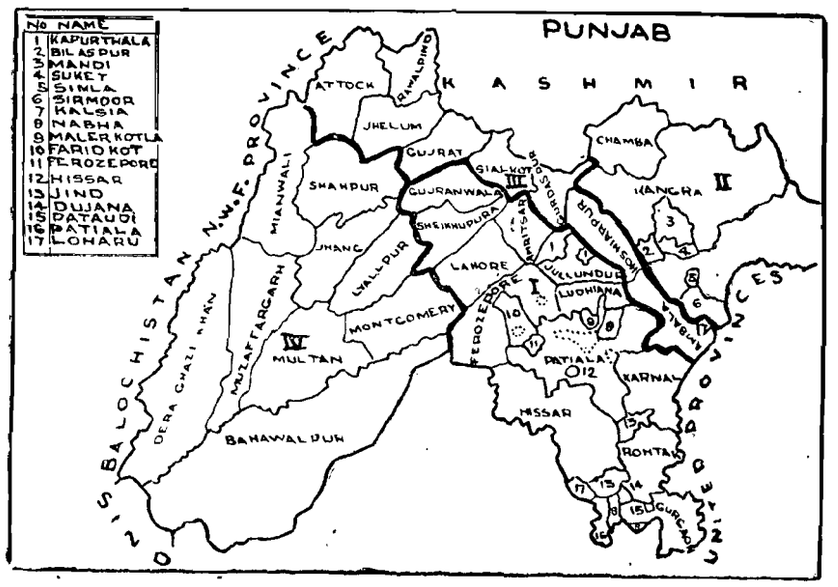

Punjab States.

3. For a lucid presentation of certain derivative results, shown in the subsidiary tables printed at the end of each chapter of this Report, the Province has been divided into four Natural Divisions, as opposed to Administrative Divisions, with main reference to physical and climatic features. These are the Indo-Gangetic Plain West, the Himalayan, the Sub-Himalayan and the North-West Dry Area. Their names are determined with regard to India as a whole, and do not

Natural Divisions.

necessarily define the areas merely in respect of their location in the Punjab. For example, the Indo-Gangetic Plain West does not only include a number of the districts and states of the Punjab, but also the western districts of the United Provinces. Similarly, the North-West Dry Area comprises some Punjab districts and Bahawalpur State as well as Rajputana, Sind and Baluchistan. The above map shows the four Natural Divisions of the Punjab, and the statement below indicates the districts and states situated in each division :—

Natural Divisions.

I. Indo-Gangetic Plain West. *II. Himalayan.*
III. Sub-Himalayan. *IV. North-West Dry Area.*

I.—**Indo-Gangetic Plain West.**

1. Hissar.
2. *Loharu State.*
3. Rohtak.
4. *Dujana State.*
5. Gurgaon.
6. *Pataudi State.*
7. Karnal.
8. Jullundur.
9. *Kapurthala State.*
10. Ludhiana.
11. *Maler Kotla State.*
12. Ferozepore.
13. *Faridkot State.*
14. *Patiala State.*
15. *Jind State.*
16. *Nabha State.*
17. Lahore.
18. Amritsar.
19. Gujranwala.
20. Sheikhupura.

II.—Himalayan.

21. *Sirmoor State.*
22. Simla.
23. *Simla Hill States.*
24. *Bilaspur State.*
25. Kangra.
26. *Mandi State.*
27. *Suket State.*
28. *Chamba State.*

III.—Sub-Himalayan.

29. Ambala.
30. *Kalsia State.*
31. Hoshiarpur.
32. Gurdaspur.
33. Sialkot.
34. Gujrat.
35. Jhelum.
36. Rawalpindi.
37. Attock.

IV.—North-West Dry Area.

38. Shahpur.
39. Mianwali.
40. Montgomery.
41. Lyallpur.
42. Jhang.
43. Multan.
44. *Bahawalpur State.*
45. Muzaffargarh.
46. Dera Ghazi Khan *(including the Biloch Trans-frontier Tract).*

The four Natural Divisions are the same as at last census. They have been retained unchanged for two main reasons. In the first place they have changed but little in their physical and climatic features since last census, although canal-irrigation in several districts of the North-West Dry Area has revolutionized the economic conditions, particularly during the last decade or two, and they now resemble more than ever some of the districts of the Indo-Gangetic Plain. In the second place any re-shuffling would have rendered the comparison of statistics with the past censuses very difficult if not an impossible task. The main characteristics of the four divisions are described below.

Himalayan. It contains country on both sides of the outer range of the Himalayas. The lower slopes, valleys and foot-hills are under cultivation. There are many

fertile tracts here and there. Irrigation is supplied by numerous mountain streams, small water-courses being made by the cultivators to irrigate the valleys and lower slopes. There is no dearth of grazing grounds, and timber and fuel-wood are in abundance. Climatically the Division is mild in summer and very severe in winter; the high mountains are covered with perpetual snows and early in winter many of the tracts become isolated from the rest of the world by wide barriers of snow and even postal communications cease. The average annual rainfall for the last decade is 62 inches as compared with the corresponding figure of 9 inches for the North-West Dry Area. The highest average (120 inches) is claimed by the Kangra District and the lowest (37 inches) by the Chamba State.

Sub-Himalayan.

This Division is the narrow strip of country, adjoining the Himalayan, called sub-montane, into which run some of the spurs of the Himalayas, such as the Siwaliks and the high hills of Kasauli, Dalhousie and Murree. In some districts the lands in the vicinity of the foot-hills are traversed by numerous hill torrents, many of which lay a deposit of silt and add to the fertility of the soil. The three northern districts of this Division are hilly in their character and for the most part composed of broken country. In the other districts the greater portion of the area is a fairly level plain, where depth to water is small and wells easy to work, except in Ambala. The rainfall is fairly copious; the ten years' average for the Division is 31 inches, the highest average being 37 inches (Kalsia) and the lowest 24 inches (Attock).

Indo-Gangetic Plain West.

This Natural Division like the North-West Dry Area is the level alluvial plain of the Punjab. The rainfall is less here than in the Sub-Himalayan area and decreases from east to west. Most of the districts and states receive a good deal of irrigation from perennial canals. The units not receiving canal water, such as Jullundur District and Kapurthala State, possess an extensive well-irrigation. The districts lying near the Rajputana border have for the greater part a sandy soil, a low water-table and very meagre well-irrigation. For example, the portions of Hissar and Ferozepore Districts outside canal-irrigation limits solely depend on rain for their crops. The average rainfall is 20 inches, the highest average being 27 inches (Karnal) and the lowest 16 inches (Ferozepore).

North-West Dry Area.

The North-West Dry Area differs from the Indo-Gangetic Plain in having a smaller rainfall and a lower water-table. During the pre-canal period, *i.e.*, less than forty years ago, it was for the most part a vast expanse of arid waste and the haunt of pastoral people, but now claims to be one of the biggest granaries of the world. The Districts of Lyallpur, Shahpur, Jhang, Montgomery and Multan and the State of Bahawalpur have benefited by several extensive canal systems, which have steadily come into existence during the last four decades. The rainfall factor has become negligible in the case of these districts, and in point of fertility they are now more than a match for the districts of the Indo-Gangetic Plain. Muzaffargarh and parts of Multan, Dera Ghazi Khan and Bahawalpur receive irrigation from a net-work of inundation canals. In the riverains of Multan, Jhang, Muzaffargarh and Dera Ghazi Khan there is also considerable irrigation from wells. The average rainfall for the Division is 9 inches, the highest average being 15 inches (Shahpur) and the lowest 5 inches (Bahawalpur).

External Changes in Boundaries.

4. The boundary of the Province has undergone no appreciable change in the last decade, and the only external transfers of area, which are hardly of

26th February 1931. It consists of residents, visitors and travellers, including British subjects, subjects of Punjab states and "foreigners." In other words, like all previous censuses, it means the "*de facto*" population or the aggregate of persons enumerated in an area.

In some tracts of the Himalayan Division, owing to their inaccessibility during winter on account of snow, the census was held at dates ranging between the 5th September and the middle of December 1930, and in their case the population obtained is the "*de jure*" population. Similarly, on account of the wild nature of the country or of the possibility of danger from wild beasts, in some parts of the Ambala and Gurgaon Districts and the Biloch Trans-frontier Tract of the Dera Ghazi Khan District, the final census was held during the day preceding the census night. In order to prevent double enumeration the persons enumerated in the non-synchronous areas were given "passes" to be shown to the enumerators in case they moved out and happened to be on the final census night at places to be enumerated on the normal date.

The practice of enumerating *de facto* population instead of *de jure* population is adopted even in the most advanced countries, such as Great Britain and America. It has the advantage of being simple, every person being enumerated wherever he happens to be at the given time, irrespective of intricate considerations of birth-place and domicile or permanent residence. The method of enumeration adopted in this country differs from that obtaining in some foreign countries in one respect. Whereas in those countries the duty of filling up the schedule devolves on the house-holder, here it is undertaken for the most part by an enumerating agency. The distribution of population at the time of the census may thus appear to be accidental to a certain extent; but apart from its being simple this method yields a count not far removed from the normal or *de jure* population if the date of the census is fixed, as it is done in India, so as not to coincide with any occasions involving an abnormal movement of the people.

The 'Census.'

8. The date of the present census, though fixed with regard to India as a whole, proved eminently suited to this Province. The movement of the people prior to the harvesting of the spring crops had not begun, and only about half a dozen fairs in the whole Province coincided with the date of the census. Efficient arrangements for the enumeration of the persons present at these gatherings were made.

Though the population of various districts, particularly of some large towns, varies with the various times of the year, the figures in the Census Report may, with certain reservations as in previous censuses, be taken as figures representing the normal population. The present census was taken about the end of February or three weeks earlier than in 1921, and the population of the Simla Town was, therefore, less than it would have been if a count had been taken at a later date; the people from Delhi had not moved up, and some departments which were permanently stationed in Simla in 1921 were no longer there, having their winter headquarters at Delhi. A special summer census, held on the 30th June 1931, showed that the town possessed 53,949 persons as against 3,266 enumerated at the normal census.

In addition to the terms mentioned above, another term 'Natural Population" will be met with in certain subsidiary tables. It means the population of an area if there was no migration. Thus the Natural Population of the Province would be obtained by excluding all persons born outside but

enumerated in the Province and including all Punjab-born persons wherever enumerated outside the Province. The complete figures for the latter, as was the case at past censuses, are not available for all countries, where they may be residing at the time of the census. The figures for a few countries are available, but in the case of others they became available too late for being used in the Report. However, the great majority of persons, who go out of the Punjab, only go to some provinces or states in India where a synchronous count is held, and so the defect is to a large extent unimportant.

Provisional Totals.

9. As soon after the census as possible the number of persons enumerated, male and female, together with the number of occupied houses, is totalled up and "provisional totals" are published. The provisional figures for the Punjab were reported to the Census Commissioner for India on the 6th March 1931 or a week after the census, and they differed from the final figures only by 800, a variation altogether negligible considering the huge population and the vast area involved.

Scope and Mode of Enquiry; Questions Asked.

The questions asked of each individual at the census are simple and not many. They relate to religion and sect, sex, civil condition, *i.e.*, whether a person is married, unmarried or widowed, age and caste; whether earner or dependant, if an earner, his or her principal occupation as well as a subsidiary occupation, if any, and if a working dependant, his or her occupation; if employed in an organized industry, its nature; birth-place, mother tongue, and other languages habitually spoken in addition to the mother tongue; whether literate or illiterate, and in case literate, name or names of the vernaculars in which literate, and whether primary-passed or not; whether literate in English, and last of all whether deaf and dumb, blind, insane or leprous. The reply to all these questions was recorded by enumerators in general schedules, the bulk of which was printed in Urdu. An attempt was made on the present occasion to enumerate the Europeans and Anglo-Indians, wherever they happened to be numerous, on the general schedule, and so English-knowing enumerators were employed and supplied with general schedules in English. This was undoubtedly a better method to ensure entries according to instructions, because however clear the instructions they can be interpreted properly only by a trained staff. Household schedules were, therefore, issued only in special cases. The facsimile of the general schedule, reproduced below, will give a clear idea of the questions asked.

GENERAL SCHEDULE.

Name of thana (Tahsil, etc.) *Name of* $\frac{Village}{Town}$ *No. of Charge*

No. of Circle *No. of Block* *Page*

House No.	Serial number of person.	Name.	Religion and sect.	Male or female.	Married, unmarried or widowed.	Age.	Caste, tribe or race.	Earner or dependant.	Occupation or means of subsistence of Actual worker.		(For organized workers) The industry in which employed.	Birth district (or country).	Mother tongue.	Other languages habitually spoken.	Literate or illiterate.	Whether literate in English.	Insane, deaf-mute, totally blind, leper.
									Principal.	Subsidiary.							
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

Special Enquiries.

In addition to the particulars collected in the general schedules, special schedules to ascertain the extent of educated unemployment were distributed among persons, who were matriculates or possessed a higher educational qualification and were unemployed and wishful for employment. The enumerators were instructed to hand over the schedules to such persons in the course of

preliminary enumeration and collect them on the final census night. The response to the enquiry was, however, very poor and the results are printed in a table at the end of Chapter VIII (Occupation). It was not considered worth while to print them, as originally intended, in Part II of the Report, which contains the Imperial Tables.

A special enquiry was also made with a view to obtain statistics about the size of families in typical areas of each district and state, and the particulars in regard to all families with both husband and wife alive were obtained in regard to occupations, castes, duration of marriage and the age at which the wife was married, together with the number of children born and surviving and the sex of the first-born child. The results are discussed in Chapter VI on Civil Condition.

Scope of Census Enquiry.

There is no gainsaying the fact that the questions asked at an Indian census are only few when compared with the number of questions asked at the time of census in some of the foreign countries. At a census of the United States of America, held as far back as 1840, an attempt was made to collect information with regard to mines, agriculture, commerce, manufactures and schools, and thus to obtain statistics about the resources of the country, industries, education, etc. This tendency has grown during the subsequent period and questions having no essential or necessary connection with the main purpose of a census, have continued to be put in ever-increasing numbers. As a matter of fact the original census, held in the United States was merely intended to secure an accurate enumeration of the population as a basis for re-apportionment of seats in the House of Representatives. In 1850 six schedules were employed, one for free citizens, one for slaves, one for deaths during the preceding year, one for agriculture, one for manufacturers, and one for social statistics.

The census of Canada follows the lines of the United States and no less than eleven schedules are employed, most of them relating to the details of industry and production, nature of employment, wages earned, and various other particulars. In consequence of the large amount of immigration to Canada, minute enquiries are also made with regard to the birth-place of parents, nationality and naturalisation. Thus over 550 questions have to be answered by each individual, and so intricate a work is not left to the house-holder but is undertaken by a special agency.

A definite limit has to be put to the number of questions at the time of census in India, owing to several circumstances peculiar to it. A synchronous count of such a large population spread over vast areas has to be taken within a short space of time, and the chief difficulty is the lack of sufficient number of intelligent enumerators, who could conduct an intricate enquiry in a uniform manner. The scope of the work, however, is being slowly increased, and as the people become more familiar with the census and its objects—they have already ceased to be indifferent to it—more elaborate enquiries will be possible in the future. The questions asked though comparatively few cover all the vital matters of general interest, and the results obtained have been tabulated in the form of 18 Imperial Tables printed in Part II of this Volume. At the end of each Chapter in this Part, will be found about half a dozen subsidiary tables giving results derived from the Imperial Tables or from information collected from other sources. Any departure from the previous censuses in the matter of the questions asked will be explained at its proper place in a subsequent Chapter.

It is not necessary here to go into the details of abstraction and compilation of the statistical material, nor to describe the difficulties that were met with

or the manner in which they were overcome. That will form the subject of a separate volume. It will suffice to say here that the slip system of sorting was again resorted to, and the work of compilation done at one central office for the whole Province except that of the Patiala, Nabha, Jind and Bahawalpur States, which carried out their own compilation and sent only the summary figures to the Central Compilation Office. Various methods to improve the work of extraction and tabulation have been carefully studied and explored. The use of automatic sorting and tabulating machines such as those used in the tabulation of statistics in some of the countries in the West, had to be rejected as being too expensive and elaborate. A process, which seems economical on the face of it, is to make a record of individuals straightaway on slips suitable for sorting and thus eliminate the filling-up of schedules and copying of the entries on the slips. The chief objection to this method, however, is that the classification made by enumerators will in numerous cases be haphazard and unreliable, and it will not be possible to have the doubtful cases verified by the supervising agency as is feasible in the case of the schedules.

SECTION 3.—AREA, POPULATION AND DENSITY.

Density.

10. The Punjab with an area of 136,964 square miles and a population of 28,490,857 has a density of 208 persons per square mile. The British Territory has an area of 99,265 square miles and a population of 23,580,852, which give a density of 238. In the case of the Punjab States, which have an area of 37,699 square miles and a population of 4,910,005, the density is 130. The States of the Punjab Agency have an area of 32,407 square miles and a population of 4,472,218.

The Punjab in respect of area is the fourth province in India, the first three being Burma, Bombay and Madras. In point of population and density, it is sixth and fifth, respectively, among the provinces. It is slightly smaller in size than the Republic of Poland, which has an area of 150,000 square miles and an estimated population of 32,150,000 (on the 31st December 1930). The number of persons per square mile in Poland is thus 214, which is about the same as in the Punjab.

The Republic of Ukraine, according to the 1926 census, has a population of 29,020,304, or about half a million more than that of the Punjab, and an area of 174,201 square miles or about 30 per cent. in excess of the Punjab, the density being 166 per square mile.

The area of the British Territory of the Punjab is nearly equal to that of the United Kingdom, which is 94,208 square miles. The population of the United Kingdom (46,077,000) according to the 1931 census is, however, nearly twice as much, which gives a density of 489 per square mile. The population of the British Territory is also comparable to that of Spain including the Canaries, which according to an estimate made in December 1931 was 23,581,000. The area of Spain is 194,208 square miles or nearly twice as large as that of British Territory, and its density (121) is thus about one-half.

The Punjab States are comparable to Ireland in point of density. In 1926 Ireland had an area of 32,531 square miles and a population of 4,228,553, the density being 130 per square mile or exactly the same as that of the Punjab States.

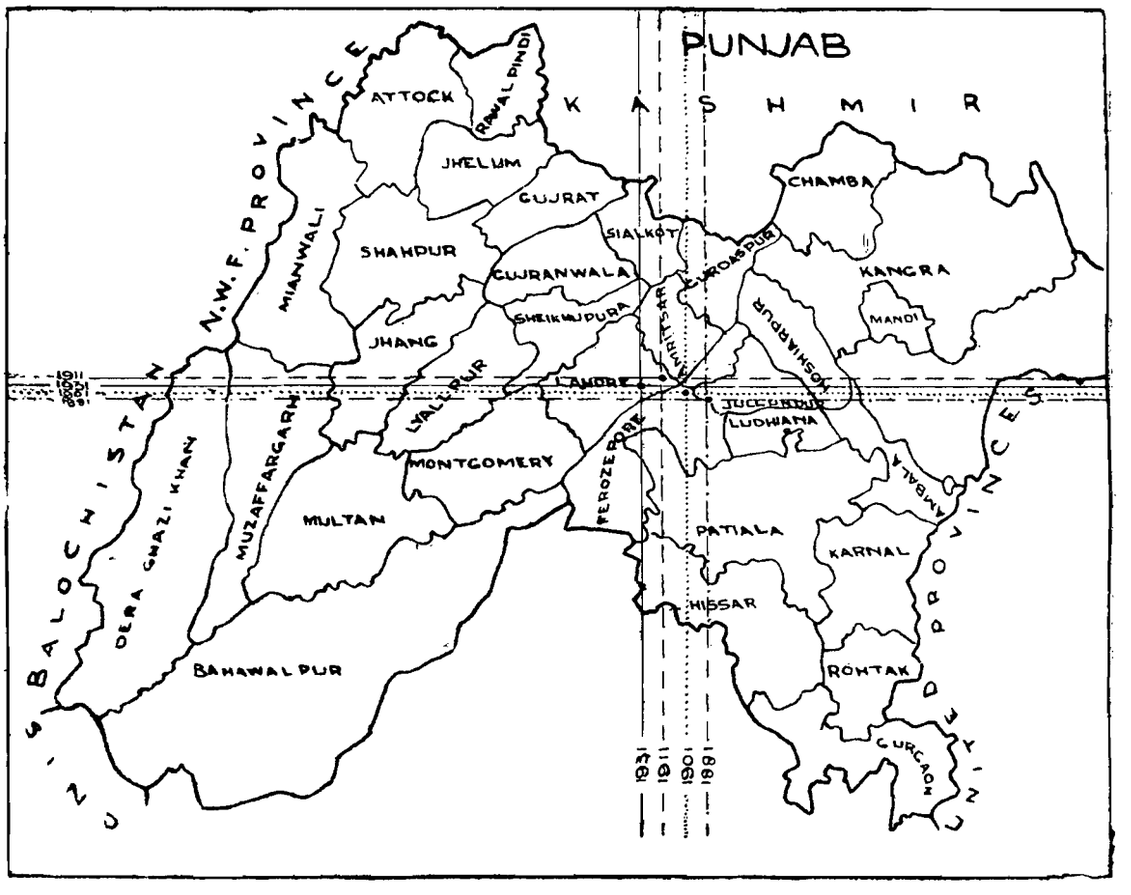

Comparison with Foreign Countries.

The table on the next page compares the latest figures of area, population and density of some of the principal foreign countries with those of the Punjab.

Country.	Area in square miles.	Population according to the last census.	Density per square mile.

The Median Point of Population.

The map below, shows the "median point" of population for the present census and for the censuses of 1911, 1901 and 1881. This point is a numerical centre, and if horizontal and vertical lines are drawn through it, each

Median Points of Population at four censuses.

of them will divide the population of the Punjab equally into two parts. It is noteworthy that the median point has moved westward, indicating that the population of the North-West Dry Area has made long strides during the last three decades as a result of the various colony schemes.

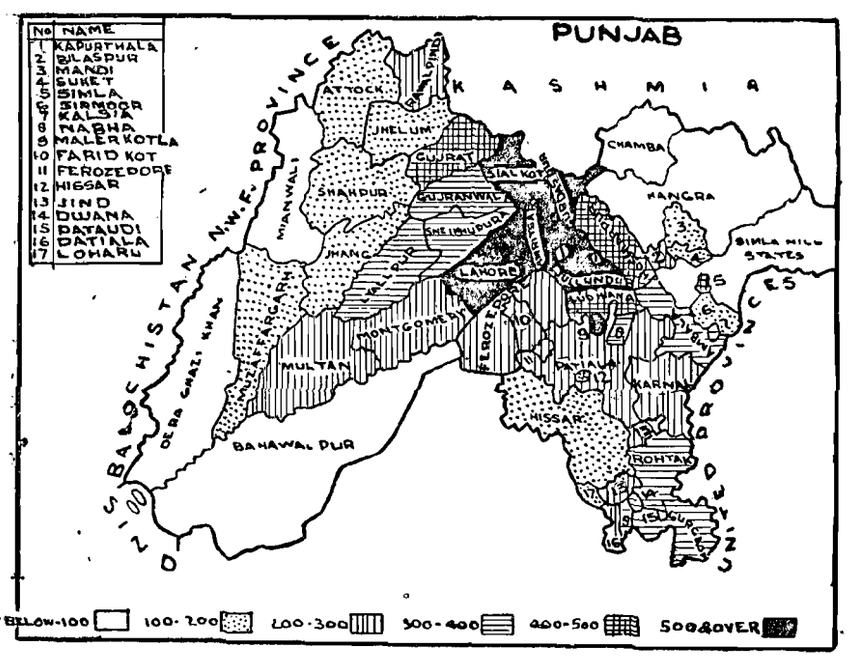

Density in Administrative Divisions.

11. The marginal table shows the area and population as well as the density per square mile of the different administrative divisions of the Province. The Multan Division with an area of 31,805 square miles is the largest in extent, but the Lahore Division with a population of 5,879,075 is the most populous. Of the Punjab States those having political relations with the Government of India are the most extensive as well as the most populous.

Division.	Area.	Population.	Density.

Density in Districts and States.

12. The density of the Province varies widely in its different parts, and the variation is undoubtedly due to the difference in ability of each to support the population. The resources and the pressure of population will be discussed later on after we have examined the conditions obtaining in different parts of the Province in the past, but it will be better at this stage to show the distribution of the population in the various parts of the Province by means of a map which appears in the margin. It can be seen at a glance that the greatest density exists in the central districts, and that the north-west of the Province is sparsely populated, as also the Hissar District in the south-east. On the north-east, Kangra, Chamba and Simla Hill States have a density below 100 owing to the hilly nature of the country. On the south-west, Bahawalpur has a very low density owing to its huge area, containing many sandy and bare tracts, which are thinly populated, but it is gaining ground as a result of canal-irrigation.

Number of persons per square mile in Census 1931.

In the following table the density figures relating to colony districts and Bahawalpur State are compared with those of the pre-canal period to show how rapidly the population rises when large tracts lying waste are brought under the plough.

SECTION 4.—VARIATIONS IN POPULATION.

Past Censuses.

13. As remarked at the outset this Report deals with the 8th census taken in the Punjab. The dates of the censuses with the name of the officer deputed to superintend the operations and the territory concerned are noted below :—

Date.	Superintendent.	Territory.
1st January 1855	Sir Donald McLeod	.. British Territory only; including the present Punjab and the North-West Frontier Province but omitting Delhi, Hissar, Rohtak, Gurgaon, and part of Karnal.
10th January 1868	Mr. A. Roberts	.. British Territory only ; including the present North-West Frontier Province, Punjab and Delhi.
17th February 1881	Mr. D. J. Ibbetson	.. British Territory and the Punjab States, the former including the same territory as in 1868.
26th February 1891	Mr. E. D. Maclagan	.. The same territory as in 1881.
1st March 1901.	Mr. H. A. Rose	.. The same territory as in 1891 but with separate statistics for (1) the Punjab including Delhi and (2) the North-West Frontier Province.
10th March 1911	Pandit Hari Kishan Kaul, R.B., C.I.E.	.. The Punjab including Delhi and the Punjab States.
18th March 1921	Mr. L. Middleton	.. The present Punjab and Punjab States with separate statistics for Delhi.
26th February 1931	Khan Ahmad Hasan Khan, K. S.	.. The present Punjab and Punjab States.

The early growth of the population of the Province under British rule was chiefly due to the increased security, and later on to improved means of production as a result of the opening of the canal colonies and the extension of the means of transport and marketing. A contributary cause was also the greater accuracy

Posts and Telegraphs. The cultivated area increased by 17 per cent. and the canal-irrigated by 19 per cent.

1881—1891. During the decade, 1881—1891, the increase in population was again rapid, and the annual rate of 1·01 per cent. is the third highest recorded so far. The area under cultivation increased by about 10 per cent., as compared with the corresponding figures of 32 and 17 per cent. for the two preceding intercensal periods. The material progress other than agricultural was however considerable and to this fact and to the absence of any famine the large rise in population, during this decade is mainly attributable. A census of the Punjab States was taken in 1881 for the first time, and in their case the annual increase during the decade was 1·04 per cent.

1891—1901. The average rate of increase during the decade, 1891—1901, was ·69 for British Territory and ·38 for Punjab States. The disparity is mainly attributable to the development of canal irrigation in British Territory as a result of the opening of the Lower Chenab Canal. The cultivated area rose by 10 per cent. and the canal-irrigated by 64 per cent. The rate of increase in population slowed down very much in the states and the districts in the east of the Province, and there was migration from Patiala to the Punjab districts. The year 1892 was the most unhealthy, cholera having caused a record mortality and fevers also being responsible for high death-rate. The decade was free from famine but the south-eastern districts experienced a great scarcity. The improved means of transport, however, were a relieving factor and the affected districts were therefore enabled to record a fair rate of increase in population.

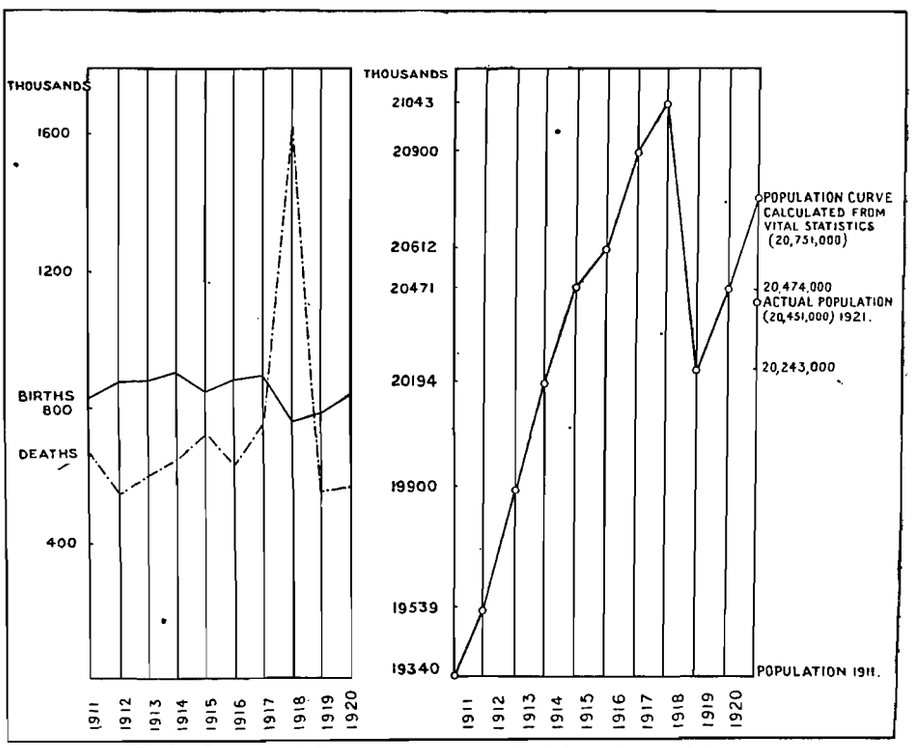

1901—1911. The decade, 1901—1911, was characterised by a prevalance of widespread disease. An epidemic of plague of great virulence coupled with fever of specially fatal type contributed to a death-rate, which exceeded the birth-rate in all the years of the decade except three, 1906, 1909 and 1910, and in one year (1907) it reached the extraordinary figure of 62·1 *per mille* mainly owing to the unprecedented mortality from plague, which caused 608,685 deaths. In the following year (1908) the death-rate amounted to 50·7, " fevers " being the main cause. The excess of deaths over births during the decade was 557,447, the total deaths from plague being over two millions in British Territory alone. The loss of female lives was appalling, and the female population for the Province was considerably in defect at the census of 1911, there being 817 females per 1,000 males in that year as against 854 in 1901. Considerable material progress was made in spite of the adverse conditions, and the Lower Jhelum Canal, opened in 1901, was irrigating an area of 1,166 square miles of what was previously a barren tract. The area irrigated by the Lower Chenab Canal increased by 602 square miles, and 1,105 miles of new railway lines were opened. The decade was also marked by steady industrial progress, and prices and wages were higher than in the previous decades.

Conditions of the Previous Decade, 1911—1921.

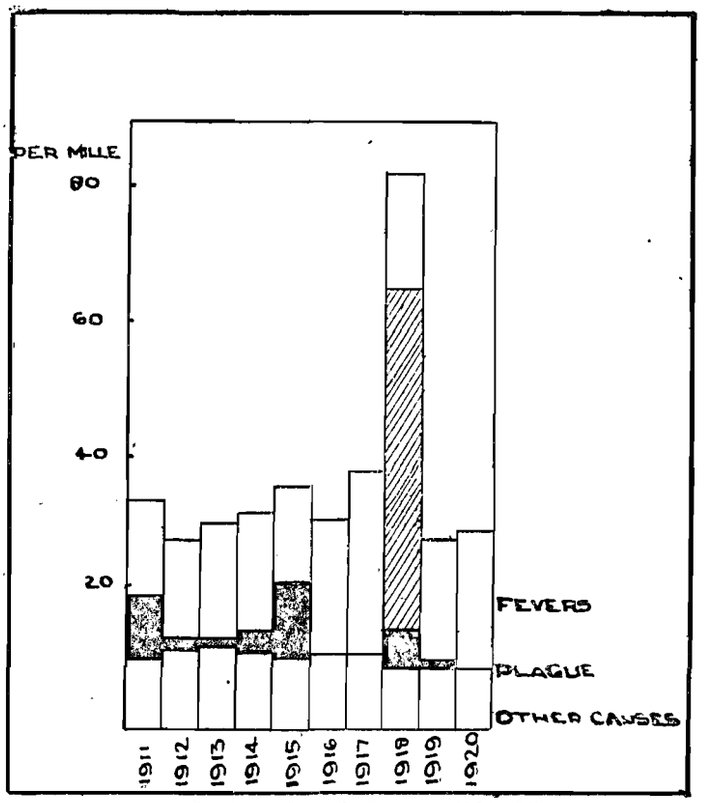

15. The annual rate of increase in the decade, 1911—1921, was ·57 in British Territory and ·48 in the Punjab States. The decade was healthy for the most part, but the year 1918 made all the difference. During that year the influenza epidemic, which came in several waves during August and September, assumed a terrible aspect in October and within a few weeks accounted for a little less than a million deaths in British Territory alone. The decade will also remain memorable because of the Great War, which raged during four of its ten years, and was responsible for a death roll of 12,794, a number too small to affect the population to any appreciable extent. The districts which contributed the greatest number

of combatants were Rawalpindi, Jhelum, Gujrat and Rohtak, each of which had more than 25,000 persons serving in the army, and in the number of troops contributed by the Punjab States Patiala's share was 50 per cent.

The diagram given below shows for British Territory the number of births and deaths together with population figures for each year, based on vital statistics. It is evident that the population kept rising each year and was at its maximum in 1917, but was brought down violently in the following year by the influenza epidemic.

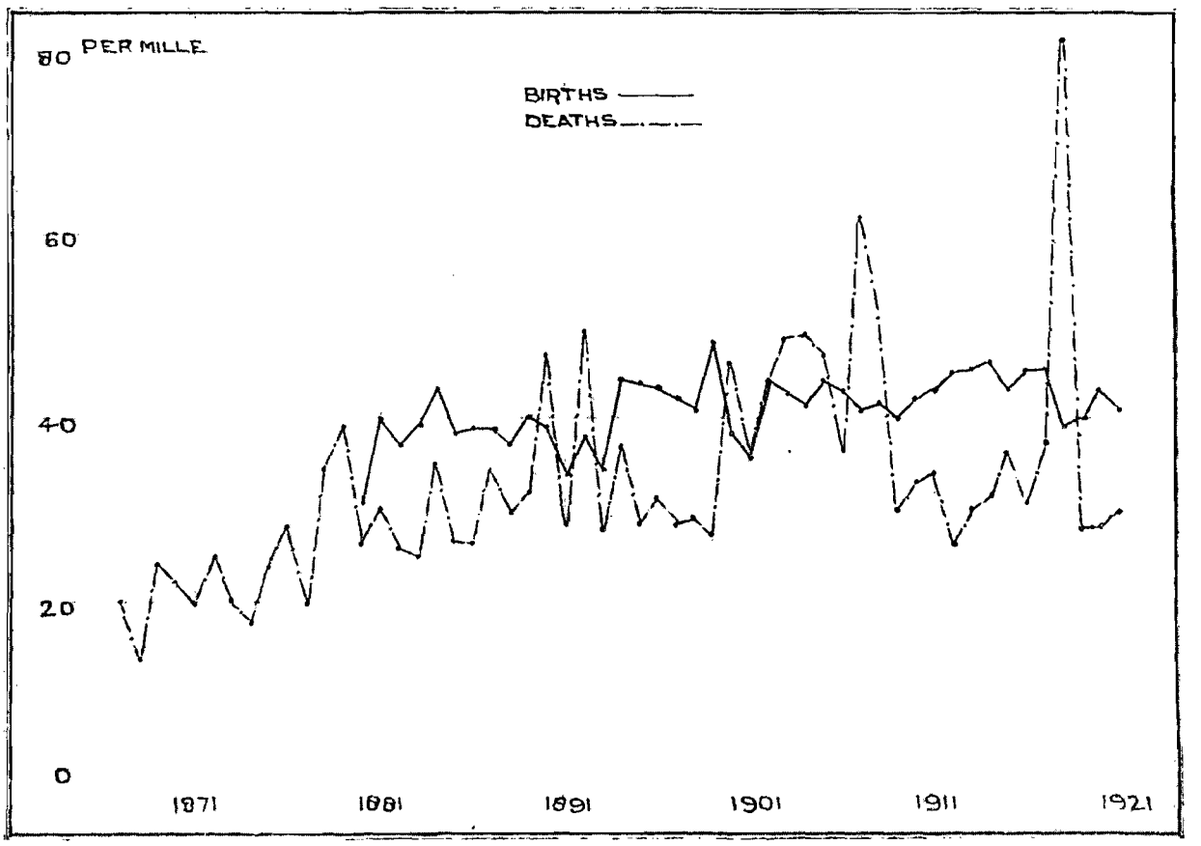

Births, Deaths and Population curve calculated from vital statistics, 1921.

Death-rate by main diseases (1911—20).

The diagram in the margin shows the deaths from main causes for each year of the decade; the deaths due to influenza have been shown by the shaded portion of the rectangle for deaths due to fevers for the year 1918.

In the Punjab the registration of deaths dates back to 1867, and that of births to 1880. The following diagram will indicate how these rates have fluctuated up to the end of the previous decade, *i.e.*, 1921.

Birth and Death-rates in the Punjab (British Territory) 1867—1921.

The highest death-rate was recorded in 1918, the year of the influenza epidemic, and the next highest in 1907 when the plague was at its worst. The birth-rate sinks low during a year following the period of any widespread epidemic, but regains its former level or even rises higher soon afterwards. It was one of the lowest in 1891 and 1893 following the years, 1890 and 1892, during both of which fevers took a heavy toll, the latter year being also characterised by the record number of deaths from cholera. In 1894 the birth-rate went up to an unprecedented figure, and five years later it rose still higher. Another year remarkable for its low birth-rate was 1909, which followed 1907 referred to above as the plague year and 1908 when mortality from fevers was very heavy. A year or so later the birth-rate made a recovery and kept up a high level till 1917.

The decade may be described as a healthy one with the exception of the year of influenza. In a series of particularly good years, 1915 and 1916 stand out as less healthy than the rest owing to epidemics of plague and fevers, respectively. Consequently the birth-rate was high except in 1918 when it dropped to an exceptionally low figure, and though it improved in each of the subsequent years, it failed to reach its former level.

The Triple Canal Project, consisting of the Upper Jhelum, the Upper Chenab and the Lower Bari Doab Canals, was completed during the decade, and by 1920-21 the three canals were irrigating 2,811 square miles.

absence of Indian representatives was resented by a section of the public. At the same time the country was drifting towards an economic depression. In 1928 as the result of a widespread revolutionary conspiracy Mr. Saunders, a young Assistant Superintendent of Police, was shot dead at Lahore in broad daylight when leaving his office and a head constable was also murdered when pursuing the assailants. Two years later an attempt was made on the life of the Governor of the Punjab when a Hindu youth opened fire on him with a pistol as he was leaving the University Hall after presiding over the Convocation. The proceedings of the judicial trials of those involved in revolutionary conspiracies were given great prominence in the vernacular press. The activities of the Congress in this Province received a fillip by the holding of its 44th session in Lahore during the Christmas of 1929, when a resolution of complete independence was passed. The civil disobedience movement was started in the spring of 1930, and an attempt was made in many places to break the salt laws. Later in the year Government took strong action against the law breakers, and numerous Congressmen were arrested. Some of the prominent Indian politicians were invited during the winter to a Round Table Conference in London. The Congress, however, declined to participate. Early in 1931 the Congress leaders were released and soon after as a result of negotiations between the Government of India and the Congress a pact was concluded, under which the Congress called off the civil disobedience and Government released all political prisoners except those convicted of violent crime. Thus the decade ended as it had begun with the political situation being a dominant feature in the country.

Health Conditions.

17. The principal features of the decade, 1921—30, so far as they bear on the general health of the people and affect the birth and death-rates, are described below year by year. The figures relate to British Territory only.

1921.

The year 1921 was healthy, though it did not come up to 1920 in this respect. The death-rate (30·1) was low but it was slightly in excess of those of the previous two years, which was largely the result of a widespread epidemic of cholera which was the highest on record since 1900, coupled with localised epidemics of malaria in areas where the monsoon conditions had been favourable. The fever death-rate was the highest of the death-rates and exceeded the rate of the previous two years. The birth-rate (41·5) was lower than that of the preceding year.

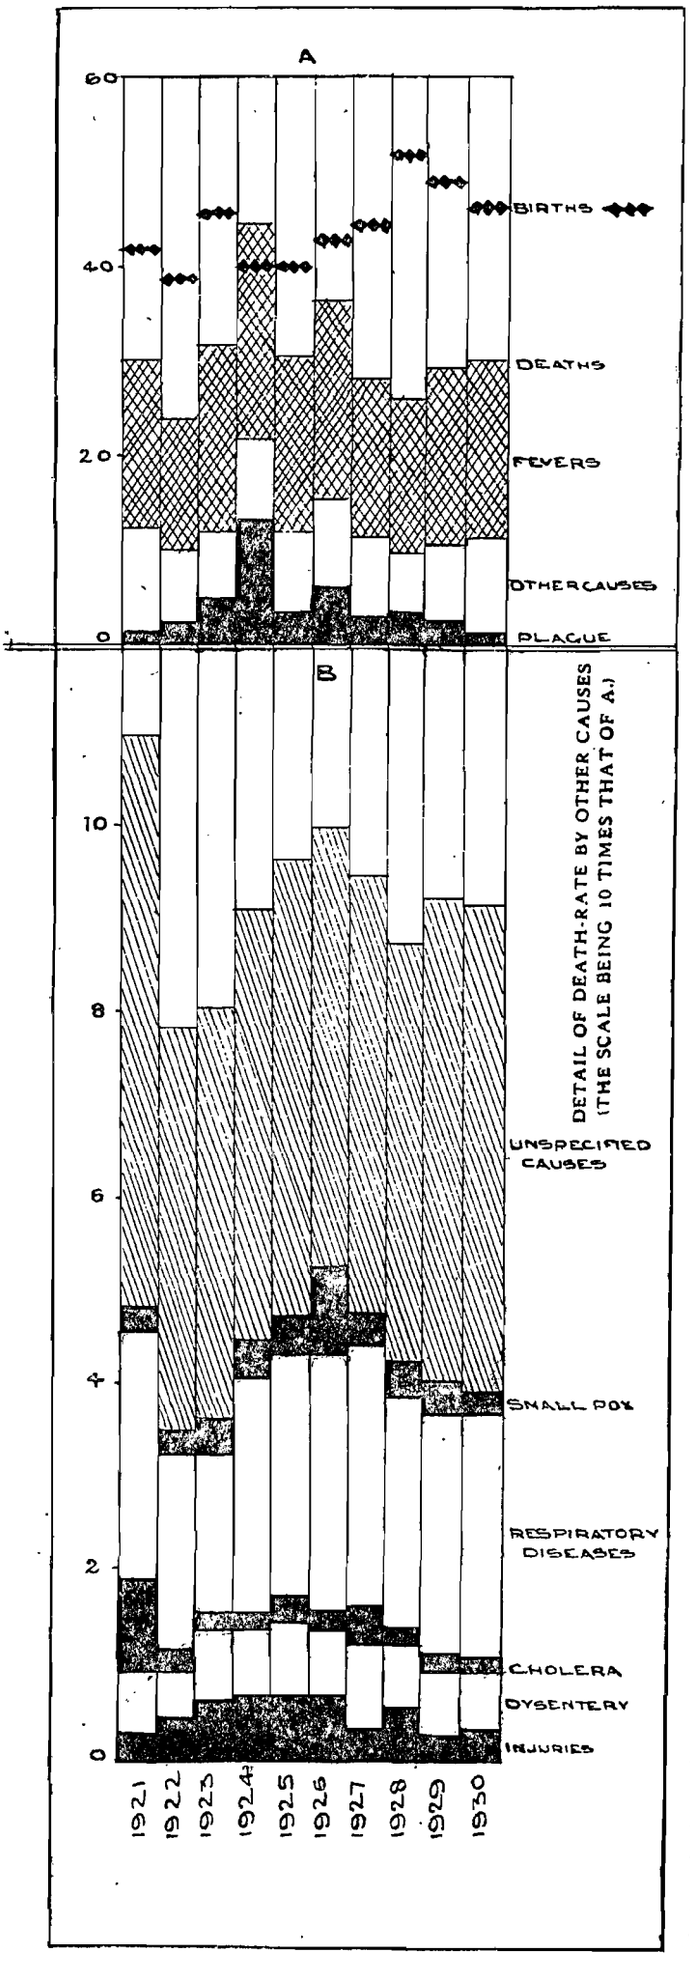

1922.

The year 1922 was an exceptionally healthy year in the Punjab. The total death-rate (22·07) from all causes was lower than it had been since 1878 and considerably lower than the quinquennial average (39·2). Only two provinces, Madras and North-West Frontier Province, reported a lower death-rate for 1922. Rainfall was timely and the meteorological conditions were unfavourable to the spread of the disease. The only epidemic disease which assumed alarming proportions during 1922 was plague, which caused 7,837 deaths as against 2,896 in 1921. Even so, the outbreak was considerably less severe than that of 1919 when the total number of deaths from plague approached 13,000. No other cause of mortality showed an increase. The birth-rate was 39·2 showing a decrease of 2·2 *per mille* as against the figure for the previous year.

1923.

The year 1923 was a year of good harvests and low prices but was considerably less healthy than the year 1922. Heavy winter and spring rains favoured the spread of plague, and a slight excess in the monsoon rainfall was responsible for an increase in the mortality from " fevers." The year was, however, relatively healthy, and the death-rate (30·94) was lower by 6·4 *per mille* than the quinquennial average but it was higher than that recorded for other provinces in India.

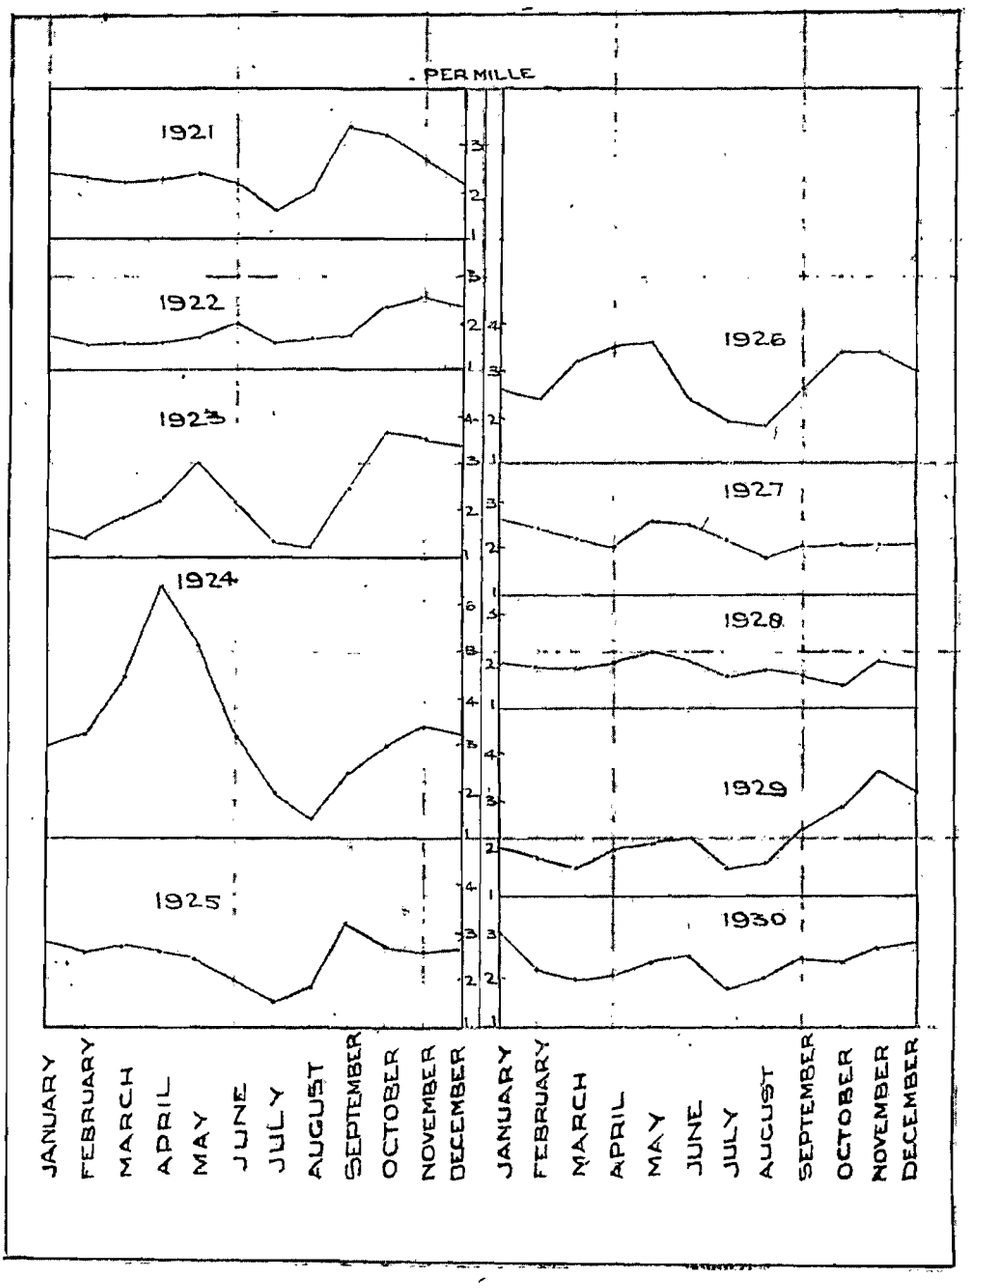

During 1923 the birth-rate rose to 43·2 *per mille* as against 39·3 *per mille* for the year 1922. This figure is the highest recorded for any province in India with the exception of the Central Provinces for which the birth-rate stood at 45·63.

Annual Birth and Death-rate (1921—30), *and deaths according to causes.*

Of the chief diseases prevalent during the year were plague and fevers with a total death-rate of 2·44 and 20·49, respectively. The latter included relapsing fever which was prevalent in an epidemic form more especially in the western Punjab. In Muzaffargarh District it was particularly severe and caused 6,207 deaths during the year. The year 1923 marks the re-organisation of the Public Health Department in the Punjab.

1924. After 5 relatively healthy years the year 1924 was characterised by extreme unhealthiness, the death-rate being 43·43 which is four times that of the United Kingdom and 16·08 *per mille* in excess of the provincial death-rate during the preceding five years. The rainfall and climatic conditions were eminently favourable for the spread of the disease and the main cause of the abnormal death-rate was plague and fevers, the figures for which were 11·48 and 3·65 *per mille* respectively, above the quinquennial averages. But the high death-rate was associated with a high birth-rate, the provinical figure being 40·1 *per mille* as compared with an average birth-rate of 40·5 during

Monthly death-rate per mille of total population for period 1921—30

the preceding quinquennium. Owing to the high death-rate there was an excess of 69,341 (3·3 *per mille*) of deaths over births—a circumstance which necessitates the statement that in the year 1924 the state of the public health was far from satisfactory.

1925. The year 1925, in spite of unfavourable climatic conditions, was relatively healthy. There was no undue prevalence of epidemic diseases and the distribution of the monsoon rainfall, which was above normal, was unfavourable to malaria. The death-rate was not only 13·4 *per mille* less than the rate of the previous year, but also less than the average for the previous quinquennium. The Punjab continued to occupy the position of having the high birth-rate and a greater excess of births over deaths (10·1 *per mille* of the population) than any other province of India. There was, however, no variation in the birth-rate for 1925 over the figures for the previous year.

1926. During 1926 the death-rate at 36·52 per thousand was 5·21 higher than the average of the previous five years. Rainy and cloudy weather in March, April and May and the consequent continuance of low temperatures and humidity provided ideal conditions for the spread of plague which was responsible for the loss of over 108,000 lives. There was practically no cholera but a widespread epidemic of small-pox caused about 17,600 deaths, and the "fever" death-rate, owing chiefly to an epidemic of malaria in the last four months of the year, was higher than in the previous year and also exceeded the average of the last five years. On the other hand the birth-rate—41·6 per thousand—was also higher and was exceeded in no other province in India except the Central Provinces.

1927. The year 1927 was one of the healthiest years in the history of the Punjab, largely owing to meteorological conditions which were unfavourable to plague in the spring and to malaria in the autumn. An epidemic of cholera of unusual intensity, however, prevailed chiefly in Kasur town and tahsil and in the Ferozepore District which took a toll of 11,286 lives. The death-rate of 27·46 *per mille* was 9·06 *per mille* less than in 1926 and 5·13 less than the average of the previous five years. In fact in only two years in the present century has the provincial rate been lower. At the same time the birth-rate of 42·3 *per mille* was slightly higher than in the previous year. The infantile mortality rate was also unusually low, the number of deaths among infants under one year of age being 167·5 per 1,000 births as compared with 203·43 in 1926.

1928. In no previous year since vital statistics became available have the people of the Punjab enjoyed such remarkably good health as in the year 1928. As a result of the timely and well distributed rainfall the year 1928 was the healthiest in the decade, the birth-rate being 46·30 which was the highest and the death-rate 24·72 which was the lowest except for 1922. The main cause of the low death-rate and the high birth-rate was the remarkable freedom from epidemics and more especially the exceptionally low incidence of plague and malaria. The general healthiness of the year was, however, marred by a very sharp outbreak of cholera in the Kulu Valley (Kangra District) where 1,746 seizures and 1,164 deaths occurred, over 70,000 anti-cholera inoculations being performed by the Public Health staff.

1929. The distribution of the monsoon was unusual; the dry western districts of the Province had abnormal rainfall while it was in marked defect in the south-eastern part. The monsoon started late and stopped early. The rainfall was particularly heavy during the second fortnight of August, causing heavy floods in the Jhelum, Chenab and Indus rivers, which resulted in a serious epidemic of malaria. The year 1929 although it did not exihbit the remarkable salubrity of the previous year must be regarded, in spite of certain vicissitudes of climate, which occasioned an epidemic of malaria in one region and economic stress in another, as a relatively healthy year. The birth-rate was 44·45 which was the highest of all other provinces in India, and the death-rate 28·75 which exceeded the provincial rates except those of Bombay and Central Provinces. Apart from the somewhat severe epidemic of malaria following the heavy floods in certain districts the year was on the whole a very healthy one. The cholera figures were somewhat higher than those of the previous year and while no serious outbreak occurred the disease was widely diffused and practically all the districts in the Province were affected.

the increase in irrigation facilities and consequent rise in the value of land and farm produce.

The Live Stock Officer and other District Veterinary Officers of the Civil Veterinary Department provide the advising and inspecting agency for the entire veterinary activities in the Province, including live-stock improvement work and the control of diseases under the direct supervision of the Director of Veterinary Services.

Hitherto, the only agency for the supply of suitable bulls for breeding purposes was the Government Cattle Farm, Hissar, but the establishment of the grantee farms in the Lower Bari Doab Canal Colony and the introduction of the Dhanni and Hariana schemes in the districts forming the home of these breeds has made it possible to arrange for the supply of pedigree bulls of such breeds as are popular in the various districts of the Province.

In addition to the supply of bulls, the Government Cattle Farm, Hissar, meets the requirements for horse and donkey stallions in the non-selected districts of the Province. Facilities are being developed for the supply of pedigree buffalo-bulls, sheep and goats to interested breeders. In many districts the income derived from horse and cattle fairs by the District Boards is quite a substantial amount and the tendency is towards exploring this method of raising revenue.

Horse and cattle fairs and the 'one day village cattle shows' provide the opportunity for the carrying out of live-stock improvement propaganda by the Department. They are being taken full advantage of for the demonstration of the better types of stock as well as improved agricultural implements and farm produce. They tend to relieve the prevailing dullness of rural life by providing an occasional district fete.

Prevention and Treatment of Cattle Diseases.

27. There are now 287 Veterinary Hospitals in the Province each in charge of a Veterinary Assistant Surgeon or Veterinary Assistant, whose duties are mainly centred on the prevention of disease within his area by the inoculation of cattle and other live-stock with protective sera and vaccines. The number of animals treated by the staff is yearly increasing. A very gratifying indication of the way the Department is gaining the confidence of the public is shown by the number of offers received from private individuals towards the cost of establishing veterinary hospitals in different areas.

Punjab Veterinary College, Lahore.

This institution was established in 1882 for the instruction of Indians, civil and military, in veterinary medicine and surgery. The college is thoroughly equipped and has exceptional facilities for teaching purposes. It has proved a great success. The course of study of the college was previously for three years in Urdu and a 4 years' course in English was started in 1921. In this institution stipends are given both by Government and local bodies to students to enable them to qualify themselves for the veterinary profession.

Irrigation.

28. The agricultural prosperity of the Province is to a very large extent dependent on irrigation. The canals are a most valuable asset and protect the Province against famine even in a dry year.

The main sources of irrigation are indicated in the margin, as also the extent of irrigation from each source. Canals of all kinds irrigate 728 out of every 1,000 irrigated acres as against 648 at last census. The majority of these canals are owned and worked by Government. Next in importance come wells with total irrigation amounting to 262 out of

Government canals	..	695
Private canals	..	33
Wells	..	262
Other sources	..	10
		1,000

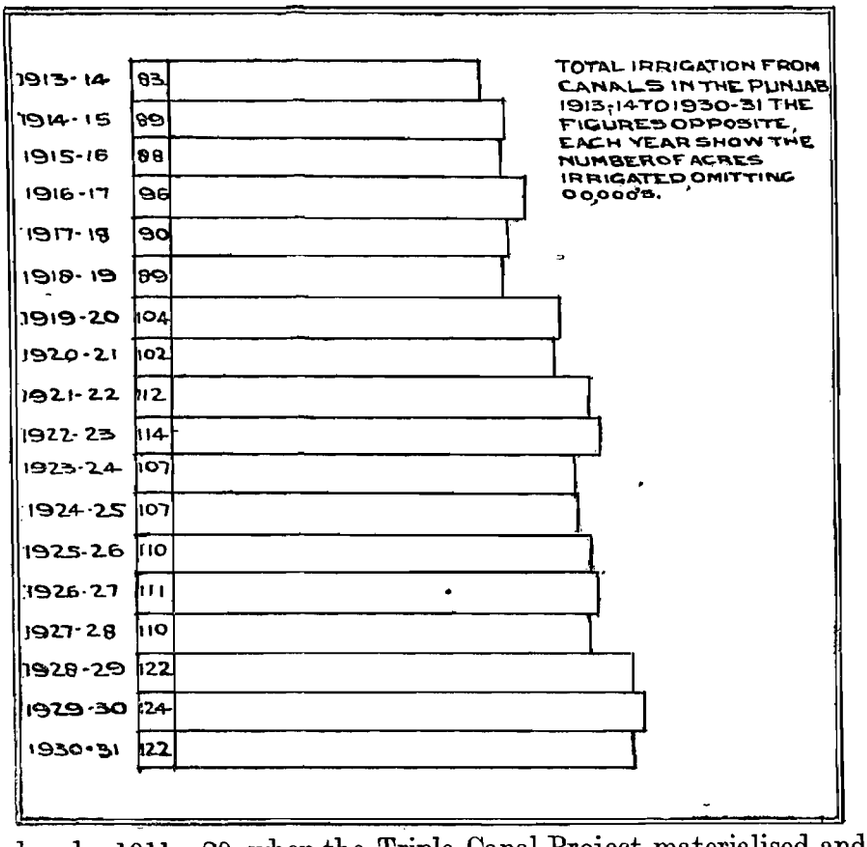

every 1,000 acres as against 299 at last census. The decline is due to the increased irrigation from canals. The wells are generally private property owned by the land-owners or by groups of land-owners. During the past decade masonary wells in use have increased from 265,879 in 1920 to 292,102 in 1930. It, however, does not follow that the well irrigation has increased in the same proportion, as irrigation from wells is extended in a dry year and contracts considerably when monsoon conditions are normal. The irrigation from " other sources " is mostly by lift from ponds, rivers and streams. The table below shows for each district the percentage of the average area irrigated from the different sources during the last decade; the districts have been arranged according to the extent of canal irrigation.

District.	Percentage of canal irrigation.	Percentage of well irrigation.	Percentage of other sources of irrigation.	District.	Percentage of canal irrigation.	Percentage of well irrigation.	Percentage of other sources of irrigation.	District.	Percentage of canal irrigation.	Percentage of well irrigation.	Percentage of other sources of irrigation.
Lyallpur ..	99	1	..	Gujrat ..	71	29	..	Ludhiana ..	24	76	..
Hissar ..	99	1	..	Muzaffargarh	68	29	3	Rawalpindi ..	23	48	29
Multan ..	90	8	2	Karnal ..	66	33	1	Attock ..	12	83	5
Shahpur ..	88	12	..	Jhang ..	66	34	..	Ambala ..	4	64	32
Montgomery ..	84	16	..	Amritsar ..	56	44	..	Sialkot ..	2	91	7
Sheikhupura ..	84	15	1	Gujranwala ..	53	46	1	Simla ..	..	..	100
Ferozepore ..	82	18	..	Gurdaspur ..	42	57	1	Kangra ..	..	..	100
Lahore ..	80	20	..	Gurgaon ..	38	58	4	Jullundur ..	..	100	..

Rohtak ..	77	23	..	Mianwali ..	33	66	1	*British Territory*	*73*	*26*	*1*

It will be seen that in 16 districts more than half of the irrigated area is served by canals and in the other 13 barring Kangra and Simla the same amount is irrigated by wells. In Kangra and Simla the only source of irrigation is streams and springs.

Canal Irrigation.

The canal-irrigated area has been steadily rising during the last decade. The statistics are available from the year 1887-88, when all the canals then in existence irrigated only 2·3 million acres. With the opening of the Lower Chenab Canal the canal-irrigated area rose to 6 million acres in 1900-01. A further development took place, mainly during the decade, 1911—20, when the Triple Canal Project materialised and in 1920-21 the canal irrigation amounted to a fraction more than 10 million acres, which is nearly equal to the total ploughed area of England and Wales (10·5 million acres). The

feature of development during the last decade is the opening of the Sutlej Valley Project, a description of which appears in the next paragraph. As a result the canal-irrigated area rose to the unprecedented figure of 12·4 million acres in 1929-30. The diagram given on page 38 shows the extent of canal irrigation in the Punjab for each year of the period, 1913-14 to 1930-31. Separate figures for the Punjab prior to 1913-14 are not available as the Delhi Province was then a part of it. For this reason the rectangles for the period, 1887-88 to 1912-13, do not appear in the marginal diagram, and can be seen at page 13 of the 1921 Report.

The following statement gives the various particulars about the principal canal systems :—

Serial No.	Name of canal system.	Length of main line in miles.	Length of Distributaries in miles.	Culturable area commanded in thousands of acres.	Average area irrigated annually in thousands of acres.	Date of commencement of construction.	Date of first irrigation.	Date of completion of construction.

(*a*) As an inundation canal system.

NOTE.—The average area shown in column 6 is for the ten years, 1921-22 to 1930-31 inclusive; but in the case of the Upper and the Lower Sutlej inundation canals the average area is for the years 1921-22 to 1927-28. These two systems were, thereafter, amalgamated with Dipalpur and Mailsi canals, respectively, of the Sutlej Valley Project. The Sutlej Valley Project canals have not been in existence for the whole decade; the average area in their case, therefore, is for the years they have actually been in operation.

Sutlej Valley Project.

29. The last four canals shown in the above statement belong to the Sutlej Valley Project, which consists of four weirs, three of which are on the Ghara reach of the Sutlej and one on the Panjnad. The uppermost weir is at Ferozepore and from it takes off one perennial canal, which commands an area of 730,000 acres in the Bikaner State and two perennial canals which have replaced and extended the inundation canals known as the Upper Sutlej Series on the right bank and part of the Grey Canals on the left bank. The second weir is at Suleimanke and controls three canals; on the right bank the Pakpattan Canal which will command about 700,000 acres in the Nili Bar, on the left bank there are the Sadiqia Canal which

among the illiterate masses of this Province, who cannot be taught by any other means, can surely be regarded as of inestimable value. At the present moment the only transmitting station in the Province, which was opened in Lahore in October 1930, is maintained by the Young Men's Christian Association and functions only from October to May. It can be picked up regularly throughout the central Punjab and occasionally in the whole of the Northern India. The total number of receiving sets in the Province is about 1,500.

Broad-casting is still in its infancy in the Pun ab, but in view of its increasing popularity it has, I believe, a great future before it.

SECTION 6.—MOVEMENT OF THE POPULATION.

Increase in the Population.

45. Having summarized in the last section the progress made by the Province in several directions we may now examine the intercensal increase in the population. The population of the Punjab has increased during the last decade by 3,389,343 or by 13·5 per cent., which is a rate of growth higher than that recorded at any previous census. The increase in British Territory amounts to 2,895,374 or 13·9 per cent. and that in the Punjab States to 493,969 or 11·2 per cent. During the last fifty years the population of the Province has risen from 20,800,995 to 28,490,857 or by 37 per cent. The corresponding figure of increase for British Territory is 6,641,540 or 39·2 per cent. and for Punjab States 1,048,322 or 27·1 per cent. The table below shows for the Punjab and some of the principal foreign countries the actual rise in population since 1881 together with the percentages of increase.

Country.	1931.	1881.	Variation.	Percentage.
Punjab	28,490,857	20,800,995	7,689,862	37·0
i. British Territory	*23,580,852*	*16,939,312*	*6,641,540*	*39·2*
ii. Punjab States	*4,910,005*	*3,861,683*	*1,048,322*	*27·1*
India	352,837,778	253,896,330	98,941,448	39·0
England and Wales	39,988,000	25,974,439	14,013,561	54·0
France	41,860,000	37,672,048	4,187,952	11·1
Sweden	6,162,000	4,565,668	1,596,332	35·0
Japan	64,700,000	35,769,000	28,931,000	80·9
United States of America ..	124,070,000	50,156,000	73,914,000	147·4

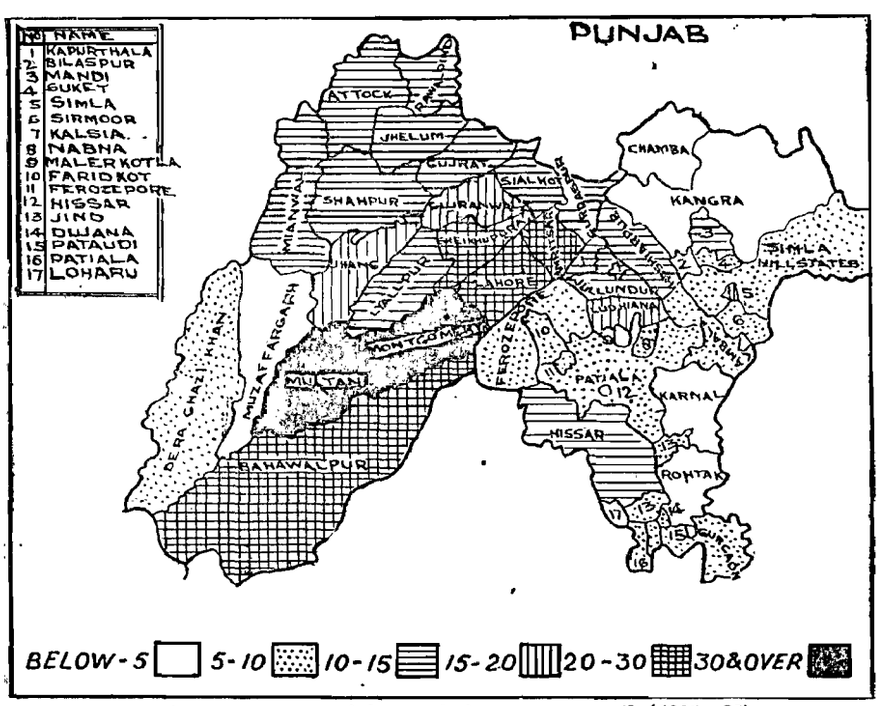

During the last fifty years the population of this Province has risen by a percentage almost equal to that of India. The rate of growth is, however, much smaller than that of England and Wales for the same period, although the latter lose much of their population by emigration. France, which has the smallest rise of all civilized countries, is of course an exception. The rise in Sweden is about the same as in India, and it would have been much greater but for large emigration to America. The rise in Japan, which is due more or less to natural causes, is twice as much as in the Punjab, while the extraordinary rise in the population of the United States of America is nearly four times as much.

The increase during the last decade is phenomenal, and was certainly not expected, particularly when it is realised that the number of deaths caused by the influenza epidemic of 1918 in British Territory alone was about a million, out of which the deaths in the reproducing section (aged 15—40) were 417,699 (205,399 males and 212,300 females). The recuperative power of the Province is, however, well-known and the birth-rate after an epidemic or famine soon recovers its former level, while the death-rate keeps low. This has been ascribed sometimes to the weeding out of the weak elements of society, as evidenced by the fact that in 1919 the death-rate fell to 28·3 *per mille* and in 1922 to 22 *per mille*, which is the lowest on record since 1877. As regards the birth-rate, it had dropped to 39·6 *per mille* during 1918, the year of the influenza, but rose to 40·3 in the following year and to 42·9 in 1920 as against 43·8, the average of the decade.

During the last decade the birth-rate maintained a high level, while the death-rate was particularly low during most of the years. The natural increase, *i.e.*, the excess of births over deaths, though considerable, does not account for the total rise in population, and the amount of migration has further to be taken into account and undoubtedly has a considerable effect on the population figures. The exodus from the Province is much greater than the influx. The statistics obtained at this census show that 705,605 Punjab-born persons were enumerated outside the Province, while 674,152 persons enumerated within the Province had been born outside its limits. This excess of emigration over immigration has also to be reckoned with.

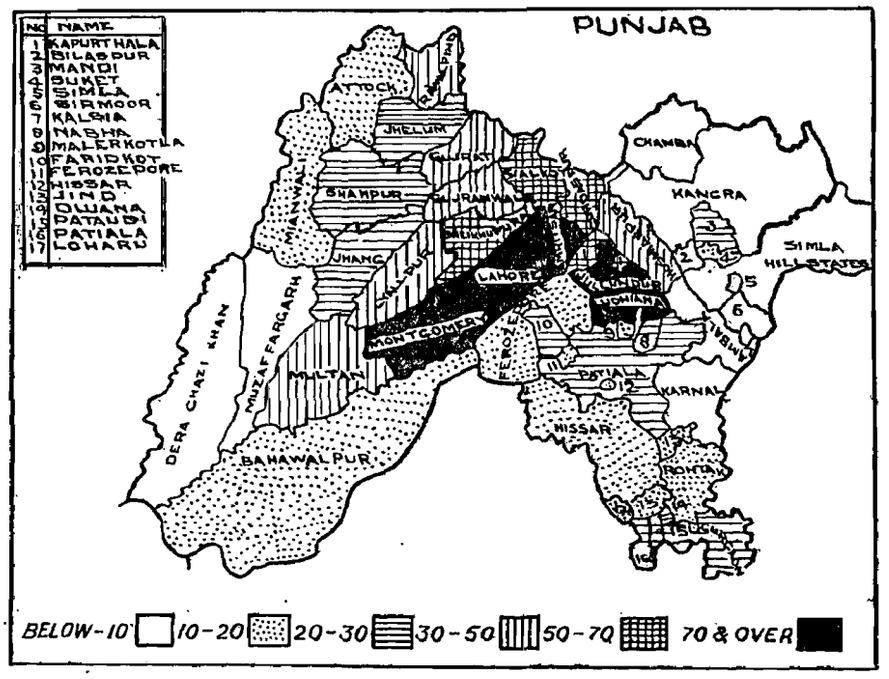

It has also to be borne in mind that the record of births and deaths cannot be entirely depended upon, and errors apart from omissions, which must be considerable especially in the case of births, are also accompanied by errors that creep in during compilation under a system, which does not enjoy the benefit of centralisation.

Before entering upon further discussion about the rate of increase in the population and ascertaining how far it is due to natural causes it will be well here to indicate by means of a map the varying rates of increase in different parts of the Province. In colony areas, where there is a considerable amount of immigration, and where the economic prosperity and sanitary conditions secure for the populace a large excess of births over deaths, the rate of increase is not at all a matter for surprise. The map in the margin shows at a glance the percentages of increase for the various districts and states. A comparison with the density map at page 13 will show that the areas with the largest percentage of increase are not necessarily those with the maximum density, and this is far from being the case except in one or two districts. It is, however, obvious that the population is gravitating towards the south-west, where the canal colonies are situated. In this tract the population is growing apace, and the rise in the Montgomery District is as large as 45·8 per cent., in Multan 32·1 per cent., and in Bahawalpur State 26 per cent. Of course, the main cause is the influx of cultivators into these areas as a result of colonization.

Increase per cent. of the population per square mile (1921—31).

a case in point and although it is the 23rd district in the order of absolute increase, it has the ninth highest percentage of rise. A more suitable way to estimate the rise in population of a locality is to examine the rise in the number of persons per square mile, for this correlates the rise in the number of persons with the extent of the area on which they are spread. The map in the margin shows the increase in the number of persons per square mile in each district and state during the last decade. It will be seen that Montgomery is among the few districts, which claim an increase of over 70 persons per square mile, and it has also the highest percentage increase. On the other hand Lahore, Amritsar, Jullundur and Ludhiana, while showing a large increase in the number of persons per square mile, do not exhibit such a large percentage of increase for the obvious reason that they were already congested. In Lyallpur, Sialkot and Gurdaspur the population has risen considerably both in respect of the total increase and increase per square mile. In Multan and Bahawalpur the increase per square mile is still very much less than in the districts mentioned above. Before Bahawalpur becomes densely populated like the neighbouring District of Multan, it will absorb nearly 200,000 more persons, and in view of its agricultural development, such a contingency does not appear to be very remote.

Increase in the number of persons per square mile. (*1921—31.*)

46. In the ordinary course of events the population may vary at each census owing (1) to a difference in the standard of accuracy attained at different censuses, (2) to variation in area, (3) to excess of births over deaths or *vice versa* and (4) to migration. For the sake of convenience the last three causes will be dealt with first. To illustrate the variation in population resulting from changes in area, it may be stated that the population of the Punjab in 1901 was smaller than in 1891 because during the intervening period a considerable portion had been taken away from it to constitute the North-West Frontier Province. As a matter of fact in the areas, which continued to form the Province, the population showed an increase as observed in Section 4 above. When we refer to the population of the Province or any of its parts at a past census, we mean the population that resided in the area as constituted at present. In this way alone a comparison is possible, and it is after the necessary adjustments that variations at each census are given in Imperial Table II for the Province as well as for all districts and states.* **The Causes of the Variation in the Population.**

*The revised total population of Lyallpur and Sheikhupura for 1921 comes to 1,009,570 persons (562,320 males, 447,250 females) and 582,895 (326,404 males, 256,491 females), respectively, and not as shown in Imperial Table II.

The external changes of boundaries during the last decade which affect the population of the Province have been described in Section 1 and the increase in population due to them is only 454 for the 1921 Census, which is negligible. All the same the figures of 1921 and of previous censuses in Table II have been adjusted.

Natural Increase, Births and Deaths.

47. We can now take up the subject of natural increase in the population. There have been 8,700,082 births and 6,260,408 deaths during the last decade in British Territory, where a uniform system of registration obtains.* The above figures do not include those for the Biloch Trans-frontier tract of Dera Ghazi Khan District, for which vital statistics are not available.

Ignoring the effect of migration for a moment and adding the births to, and subtracting the deaths from, the population enumerated at the Census of 1921 we would obtain the population of the Province, as warranted by natural increase. This simple expedient, applied to the figures for British Territory, gives result as shown in the margin. This indicates that the actual population is greater than the estimated population.

Census population of 1921	20,658,720
Add excess of births over 1921—30 deaths during the decade, 1921—30.	2,439,674
Calculated population 1931	23,098,394
Census population 1931	23,551,210
Excess in census pcopulation 1931	452,816

An attempt may now be made to calculate the population after taking into account the element of migration during the last decade. The vital statistics do not include the particulars of persons, who were born in the Punjab but left it during the decade, or those who were born elsewhere and came to reside therein. As no information is available as to the number of such persons, the only alternative is to make an estimate from the material at our disposal. That material consists of the number of persons enumerated in the Punjab with a foreign birth-place (immigrants), the number of the Punjab-born enumerated in other provinces and some foreign countries (emigrants), and the total number of births and deaths recorded during the last ten years. In making an estimate of migration we will have to assume that the waves of migration are constant from year to year; and that those who migrate do not return. The proportion of the population, which migrates to and from the Province, is so small, being only between 3 and 5 per cent., respectively, of the total population, that it should not affect the results to any appreciable extent, even if the calculations err slightly on one side or the other.

The number of the present migrants is known to us, and we can obtain from the last Census Report the number of persons born in the Punjab and enumerated outside in 1921, while the same Report will also give us the number of persons born outside and enumerated in the Province in 1921. These we may call the emigrants and immigrants of 1921. The figures of emigrants of 1931, as communicated by the Census Commissioner, and immigrants in our own records contain some of the persons, who had migrated prior to 1921 and were still alive. If we could find out their number we would be in a position to ascertain the number of persons who migrated during the last decade. The only means to ascertain the former figure is the application of a suitable death-rate to the total number of migrants of 1921. While determining the death-rate we have to bear in mind the fact that the persons, who leave the Province of their birth, are generally in the prime of their lives, and as a rule, come from the more energetic and healthy section of society. They include a comparatively small

*41,396 births and 30,104 deaths, registered in cantonments, situated in British Territory, have been added to figures supplied by the Public Health Department for the statistical Punjab.

Some of these districts have a large urban population which is not solely dependent upon land, and it will, therefore, be better to examine the growth of the rural population. Some of the relevant figures are quoted in the margin for the districts which possess a large urban population,

District.	Rural Population.		Increase or decrease per cent. in		Emigrants to canal colonies during the decade.
	Absolute increase (1921—31).	Natural increase (1921—31).	Average yearly matured area.	Average yearly irrigated area.	
1. Lahore ..	66,621	96,777	+7	+11	22,229
2. Amritsar ..	76,540	109,104	+10	+20	32,665
*3. Sialkot ..	−5,918	75,772	−9	+22	26,047
†4. Gujranwala ..	72,479	63,323	+4	+7	2,901
5. Gujrat ..	87,129	52,965	+27	+52	21,896
6. Ludhiana ..	68,803	73,763	+10	+31	11,144

and for Gujrat, which lies close to them. This analysis clearly explains the rise in the rural population of districts like Lahore, Amritsar, Sialkot and Ludhiana where there is a larger natural increase than the absolute increase recorded at the census. The conditions in these districts thus resemble those obtaining in Jullundur, Gurdaspur and other districts in the third group dealt with above, and there is a considerable emigration from them. The conditions in the villages of Sialkot District, in point of emigration, are even more advanced as there is an actual decrease in the rural population, and the whole of the large natural increase has proved inadequate to counteract it. Numerous cultivators of this district, whose lands were damaged by water-logging, have been allotted colony land in the Montgomery District, and in some cases whole villages have been transplanted to the Nili Bar Colony. There has also been emigration from the district to Bahawalpur State and even to such distant places as Rampur, Gwalior, Bikaner and Sind.

The rise in the rural population of Gujranwala may be partly due to the increase in irrigated area. The increase in Gujrat is undoubtedly due to a large extent to the extension of canal irrigation, particularly in the uplands of Phalia Tahsil, as indicated by the marginal table.

Tahsil.	Population in 1931.	Percentage of rise.
Gujrat ..	316,370	7·0
Kharian ..	275,947	10·3
Phalia ..	330,110	18·6

The figures for the rural population of the remaining districts, which lie in the east, north and north-west are given in the margin. The absolute increase in Karnal District is the lowest, while the figure of natural increase is also insignificant, mainly owing to its bad climate. In the other four Districts, Kangra, Jhelum, Rawalpindi and Attock, rural population has risen considerably more than the natural increase would warrant. These four districts are foremost in the Province in providing recruits for the Army, and evidently the large number of men demobilised during the last decade is to a great extent responsible for the difference in the natural and the actual increase. It is also probable that the vastness and hilly nature of these districts and the dearth of suitable roads render their vital statistics comparatively less reliable.

District.	Increase in rural population		Migration to colonies.	Percentage of variation in	
	Actual 1921—31.	Natural 1921—31.		Average matured area.	Average irrigated area.
Karnal ..	3,109	4,649	1,142	8	5
Kangra ..	33,792	25,810	1,327	7	..
Jhelum ..	56,085	35,414	10,865	14	−13

Attock ..	55,138	46,430	4,039	12	−1

* The area figures of Sialkot show variation since 1921-22.

† In this case migration to the other colony districts and Bahawalpur State has been quoted as part of the district itself lies in a colony.

Lack of Migration Figures.

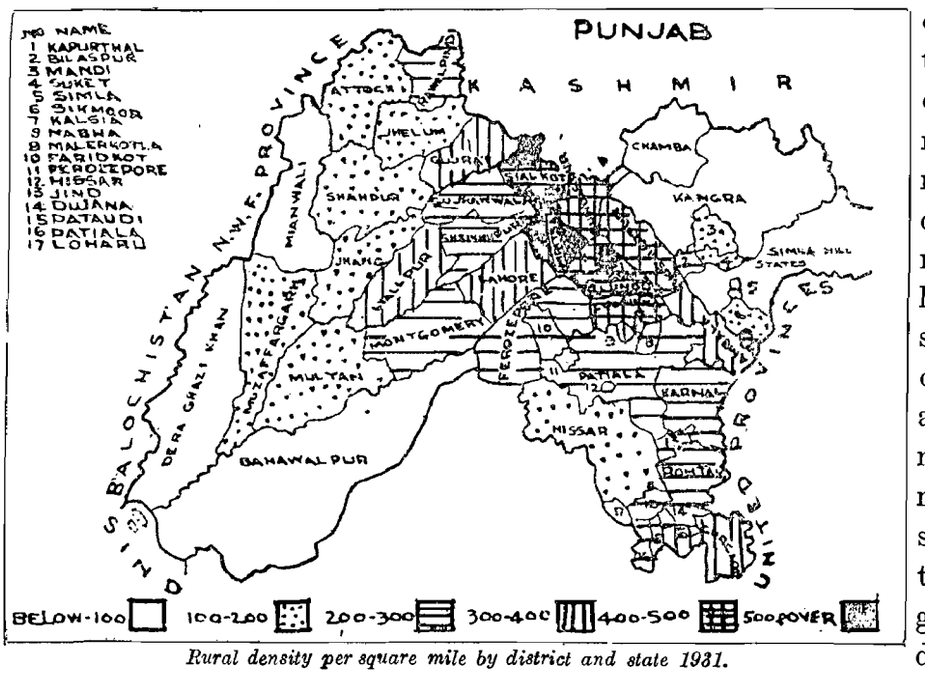

Reference has been made in the table in the last paragraph to the amount of emigration to colonies in the case of certain districts. A study of the effect of the total inter-district migration is not possible, as figures of birth-place by districts were not sorted on the present occasion except in the case of colony districts. Most of the inter-district migration except to towns is, however, of the casual type and more or less balanced by equal movements in opposite directions.

As regards the growth of the population in towns, it is obvious that the causes for the growth are not so apparent in their case as in rural areas. In the case of towns in most cases the natural increase is only a fraction of the rise in actual population, the main factor being immigration from rural areas, other towns or even from places outside the Province. The subject of the increase in urban areas will be examined at length in the next Chapter. Here it will suffice to say that the urban population, which is only about one-seventh of the rural, has increased at a comparatively much faster rate.

Pressure on Resources.

53. The subject of pressure on resources is a rather complicated one, and in the census report of a province, which is predominantly agricultural, all that we can do is to study the pressure of population on agricultural resources, with main reference to the density of rural population and its incidence on sown and matured areas. Reference has already been made in the last paragraph to the pressure on the resources of certain districts, from which there is a steady stream of emigration to the canal colonies. This migration tends to equalize the pressure on the resources in different parts of the Province, but there are certain impediments to perfect equalization, for example the great attachment of human beings to the surroundings in which they have been brought up. We can on the whole make general remarks about the conditions in each area, as found at the time of the census, to indicate where there is room for further expansion.

The conditions in each district vary considerably, and the rural population though mainly supported by agriculture is also helped by the presence of other natural advantages, such as extensive pasturage and income from the sale of milk, *ghi* and wool. The Punjab peasant or the village menial has not yet taken, to any appreciable extent, to subsidiary industries such as sericulture, lac-rearing, orchard-growing, bee-farming, etc., for augmenting his income directly or indirectly so that he is almost entirely dependent on agriculture. First of all we may examine the density of rural population per square mile of the rural area. The map in the margin shows this at a glance. The districts

Rural density per square mile by district and state 1931.

District.	Density per square mile.	District.	Density per square mile.
1	2	1	2
British Territory ..	*209*	Rawalpindi ..	257

Sheikhupura ..	287	Mianwali ..	69
Gujranwala ..	272	Dera Ghazi Khan ..	49

are arranged according to rural density in the table appearing in the margin. This table, while showing the districts such as Jullundur, Sialkot, Amritsar, Gurdaspur, Hoshiarpur, Ludhiana, Gujrat and Lyallpur, as having a high density, does not really indicate the extent of the pressure on resources of certain other districts such as Kangra, Simla, Dera Ghazi Khan, Muzaffargarh and Rawalpindi, which possess extensive areas but very little cultivation. No doubt, the pressure of the rural population on resources can be better studied if we know the total annual value of agricultural produce for each district. This information, however, is not readily available, and an attempt to obtain it would be an exceedingly laborious task, involving the calculation of (*a*) the annual matured area under each crop grown in the district, (*b*) the normal yield per acre of each crop, and (*c*) the commutation price per maund of each crop. Further, we will have to make these calculations in respect of several years, and then to strike an average in order to know the value of the total produce of a district during an average or representative year of the last decade. Obviously an attempt at these elaborate and extensive calculations is not worth the trouble for our purpose. We have, therefore, to be content with the examination of the incidence of rural population on a square mile of sown and matured areas. It may be necessary to mention that the extent of sown area varies from year to year, being mainly governed by rainfall. In a dry year it contracts, while in a year of copious rainfall it extends considerably. So the suitable method is to take the average of the decade, and this is done in the table below, which also gives the incidence of population on average matured area. Similar figures of incidence for the previous decade have also been given with a view to show in what districts the incidence has materially altered during the last decade.

District.	Incidence of the rural population per square mile on: Average sown area for the decade ending in			Average matured area for the decade ending in			District.	Average sown area for the decade ending in			Average matured area for the decade ending in

* In the case of Sheikhupura and Gujranwala the figures of sown and matured areas are not available for the period prior to 1919-20, and an average has been taken on the figures of the two years 1919-20 and 1920-21.

huts and shelters. In 1901 the definition was widened and a house came to be defined as any place which happened to be occupied on the final census night, the selection being left to the discretion of the local census officers. In 1911 the definition was made rigid, and has remained unchanged since then. In villages a house now means a separate *chulha* or hearth, while in towns it means a building intended for the exclusive residence of one or more commensal families apart from other residents of the street or lane. The definition is reproduced below from the Census Code.

"In rural areas, 'House' means a structure occupied by one commensal family with its resident dependants, such as widows and servants. Such detached structures, as have no hearth, but are likely to have one or more persons sleeping therein on the night of the final enumeration, should be treated as separate houses, so that no person may escape enumeration."

In towns and cities, "House" means a structure intended for the exclusive residence of one or more commensal families apart from other residents of the street or lane. In hotels or *serais* each separate room or suite of rooms should be treated as a separate house. Shops, schools and other institutions, having no hearth, but which may possibly have some one sleeping therein on the night of the final enumeration should be numbered as separate houses. In Civil Stations each tenement in a row of servants' quarters will be treated as a separate house.

It is evident that while in villages a house represents one commensal family, in towns it may mean in many cases several commensal families.

Number of Persons per House.

58. The figures in the margin show the average number of persons per 100 houses and houses per square mile recorded at all the censuses since 1881, but in view of the change in the definition since 1911 no real comparison is possible except in the case of the last three censuses. The number of houses per square mile varies in each Natural Division, being the smallest in the Himalayan and the largest in the Sub-Himalayan. The North-West Dry Area has only a few more houses per square mile than the Himalayan, while the Indo-Gangetic Plain has a few less than the Sub-Himalayan. The following table compares the number of houses per square mile at the present census with those in 1921 by Natural Divisions.

Year.	Number of houses per square mile.	Number of persons per 100 houses.
1	2	3
1881 ..	25	680
1891 ..	27	660
1901 ..	30	620
1911 ..	40	450
1921 ..	40	450
1931 ..	44	479

Natural Division.	*Average number of houses per square mile.*	
	(1931)	(1921).
1. Indo-Gangetic Plain West ..	68	64
2. Himalayan	21	18
3. Sub-Himalayan	76	70
4. North-West Dry Area	25	23

Special instructions were issued on the present occasion requiring that houses which were most unlikely to be inhabited on the final census night should not be numbered, and yet we find that the number of occupied houses was only 73 per cent. of the total number of houses as indicated below :—

Number of houses recorded during the preliminary enumeration	*8,167,739*
Number of houses found occupied on final census night	*5,943,652*

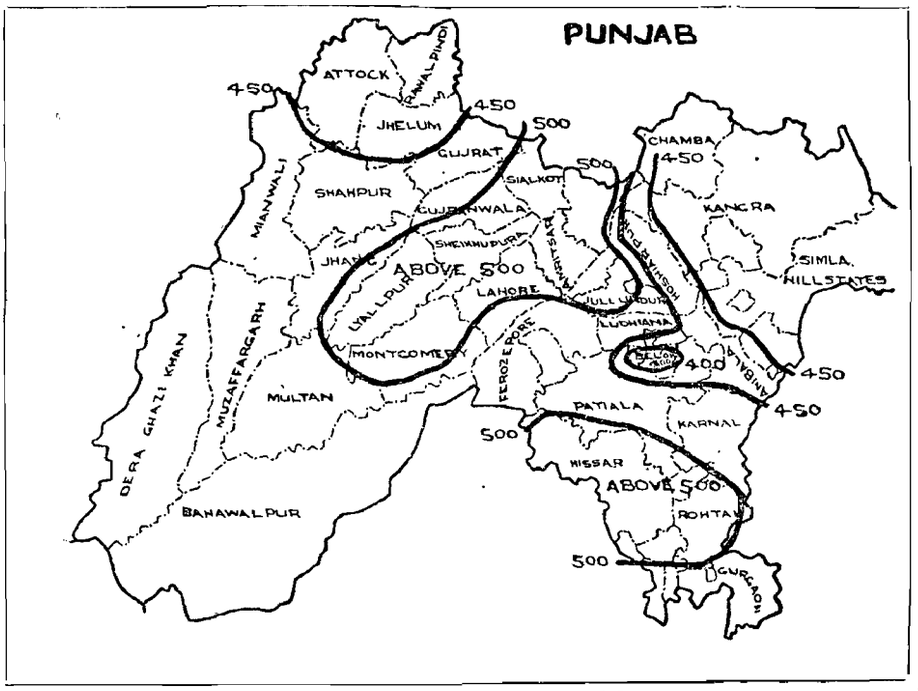

As compared with the last census, the number of occupied houses has increased by 411,347 or by 7 per cent. As against this the population has increased by 14 per cent., which indicates that the provision of new accommodation has not kept pace with the increase in the population.

Size of Family.

The size of families in 1931 is compared with the corresponding figure for 1921 in Subsidiary Table XI to Chapter II for each tahsil and city in the Province. An extract from this table is reproduced below. It will be seen that the size of the family has not altered much, and tracts with large families in 1921 are even now characterised by the same feature.

Districts and States with large families.	Number of persons per 100 houses.		Districts and States with small families.	Number of persons per 100 houses.	
1	1931. 2	1921. 3	1	1931. 2	1921. 3
Lyallpur	572	537	Simla	326	426
Loharu	557	510	*Maler Kotla*	391	270
Montgomery	533	469	Jhelum	403	376
Amritsar	525	452	Attock	419	406
Sialkot	525	449	*Bilaspur*	424	430
Sheikhupura	514	604	Dera Ghazi Khan	432	502
Jullundur	511	437	Ambala	434	407
Hissar	508	482	Rawalpindi	437	416
Rohtak	508	488	Hoshiarpur	442	410
Jind	505	490	*Kalsia*	444	430
Gurdaspur	501	466			
Dujana	497	500			
Faridkot	496	470			

The same remark applies to the tract having exceptionally small families. Thus Maler Kotla, which had the smallest number of persons per 100 houses at last census, is even now lowest in this respect among the districts and states except Simla District, where the bulk of houses is within the limits of Simla Municipality, which were practically deserted at the time of the census, most of them having only a *chaukidar* each.

Number of persons per 100 occupied houses.

The map in the margin shows the number of persons per 100 occupied houses; the greatest depression has Maler Kotla as its centre. The central districts have the largest families, while the eastern part of the Province has the smallest except in the Hariana tract in the south east where the families are comparatively bigger. The submontane districts of Jhelum, Rawalpindi and Attock have small families (less than 450 persons per 100 houses) and in the Himalayan tract an average family is slightly larger.

The size of the family in this Province is compared below with the corresponding figures of certain other provinces.

Province.	*Number of persons per 100 houses.*		
	Total.	*Rural.*	*Urban.*
Punjab	*479*	477	493
United Provinces	*477*	482	440
Bengal	*514*	518	467
Bihar and Orissa	*518*	519	482
Bombay	*501*	490	545

The variation in the number of persons in rural and urban families from census to census is of considerable interest. The figures for the last three censuses are given in the margin for the British Territory. The number of persons per family has increased. The figures of urban family showed a considerable decline in 1921 when they dropped even below those of a rural family. The only comment that can be offered on this variation is that the definition of 'house' in town or city is in a way arbitrary and rather difficult of uniform interpretation.

Number of persons per 100 houses.	*1931.*	*1921.*	*1911.*
Rural ..	479	456	446
Urban ..	505	444	473

Soon after the final census a special family census was held in typical tracts of the various districts and states. The results obtained are discussed in Chapter VI, Civil Condition.

Himalayan and lowest in the Indo-Gangetic Plain. The proportion of females in rural population is everywhere higher than in the total population.

Rural Population by Religion.

69. The statement below shows the total rural population by religion, enumerated in British Territory, Punjab States and each Natural Division. These figures too like those given above are not readily available from any of the tables.

Locality. 1	Hindu. 2	Sikh. 3	Muslim. 4	Christian. 5	Others. 6
Punjab	7,274,075	3,816,034	13,101,961	352,608	424,730
British Territory	5,202,341	2,858,463	11,702,800	349,152	400,632
Punjab States	2,071,734	957,571	1,399,161	3,456	24,098
Indo-Gangetic Plain, West	3,697,624	2,647,566	4,021,716	164,598	200,962
Himalayan	1,662,739	7,346	70,750	858	29,367
Sub-Himalayan	1,224,036	702,822	3,626,455	108,674	119,122
North-West Dry Area	689,676	458,300	5,383,040	78,478	75,279

The results derivable from the above figures are given in the marginal table, which shows the distribution of 1,000 of the total population of each unit by religion. The figures will be useful for purposes of reference. A similar detail for each district or state can be obtained by the subtraction of the figures of Table V from those of Table XVI. No comment is called for.

of these periodic visitors bring merchandise for disposal in the towns of the Punjab.

Numerous men belonging to some of the Punjab districts emigrate in winter to the United Provinces to carry on a trade in coarse cloth. The number of the Punjab-born, enumerated in the United Provinces, is nearly 98,000 (males 53,000 and females 45,000), and if from these the casual migrants to adjoining districts were excluded the periodic migrants would form a large portion of the rest.

Semi-permanent Migration.

75. The immigrants who belong to this category are those who have come from their home districts to cities and large towns. These men presumably migrate to make a living, and after spending a number of years in such areas return to their homes with which they always keep in touch. The great majority of government officials and employees of railways and other commercial institutions belong to this category, as also students and workers in large industries and workshops. Practically all Europeans and those with their birth-place in one of the Presidencies (Bengal, Madras and Bombay), enumerated in this Province, may safely be regarded as belonging to this class. The same could be said of a number of persons born in the United Provinces, who happened to be in the Punjab at the time of the census. The large majority of the U. P. men were of course found in the contiguous Punjab districts and belong to the class of casual migrants.

Permanent Migration.

76. An example of the largest wholesale permanent migration within the Province is the migration to canal colonies. This movement, which has been operative for the last forty years or so, is not likely to show for some time to come any signs of abatement. The Districts of Lyallpur and Shahpur, which were the first to be colonized, are no longer the centres of attraction, and more recently their place has been taken by the Montgomery and Multan Districts and Bahawalpur State.

The number of persons, enumerated in the colony districts and Bahawalpur State and born in the other Punjab districts and states, is shown in Part C of Table VI. The colony districts include Lyallpur, Shahpur, Multan and Montgomery and parts of Gujranwala, Sheikhupura and Jhang. The number of persons who actually emigrated from each district to the colony districts and Bahawalpur State in the last ten years is given in the margin.

Statement showing the actual number of emigrants to all the colonies (taking the colonies as one unit) from each district during the decade.

District.	Number of calculated emigrants during the decade.	District.	Number of calculated emigrants during the decade.
1	2	1	2
Hissar	3,057	Lahore	22,229
Rohtak	3,264	Amritsar	32,665
Gurgaon	2,877	Gurdaspur	15,952
Karnal	1,142	Sialkot	26,047
Ambala	2,449	Gujrat	21,896
Simla	62	Jhelum	10,865
Kangra	1,327	Rawalpindi	5,777
Hoshiarpur	17,490	Attock	4,039

Ludhiana	11,144	Muzaffargarh	6,705
Ferozepore	17,433	Dera Ghazi Khan	3,460

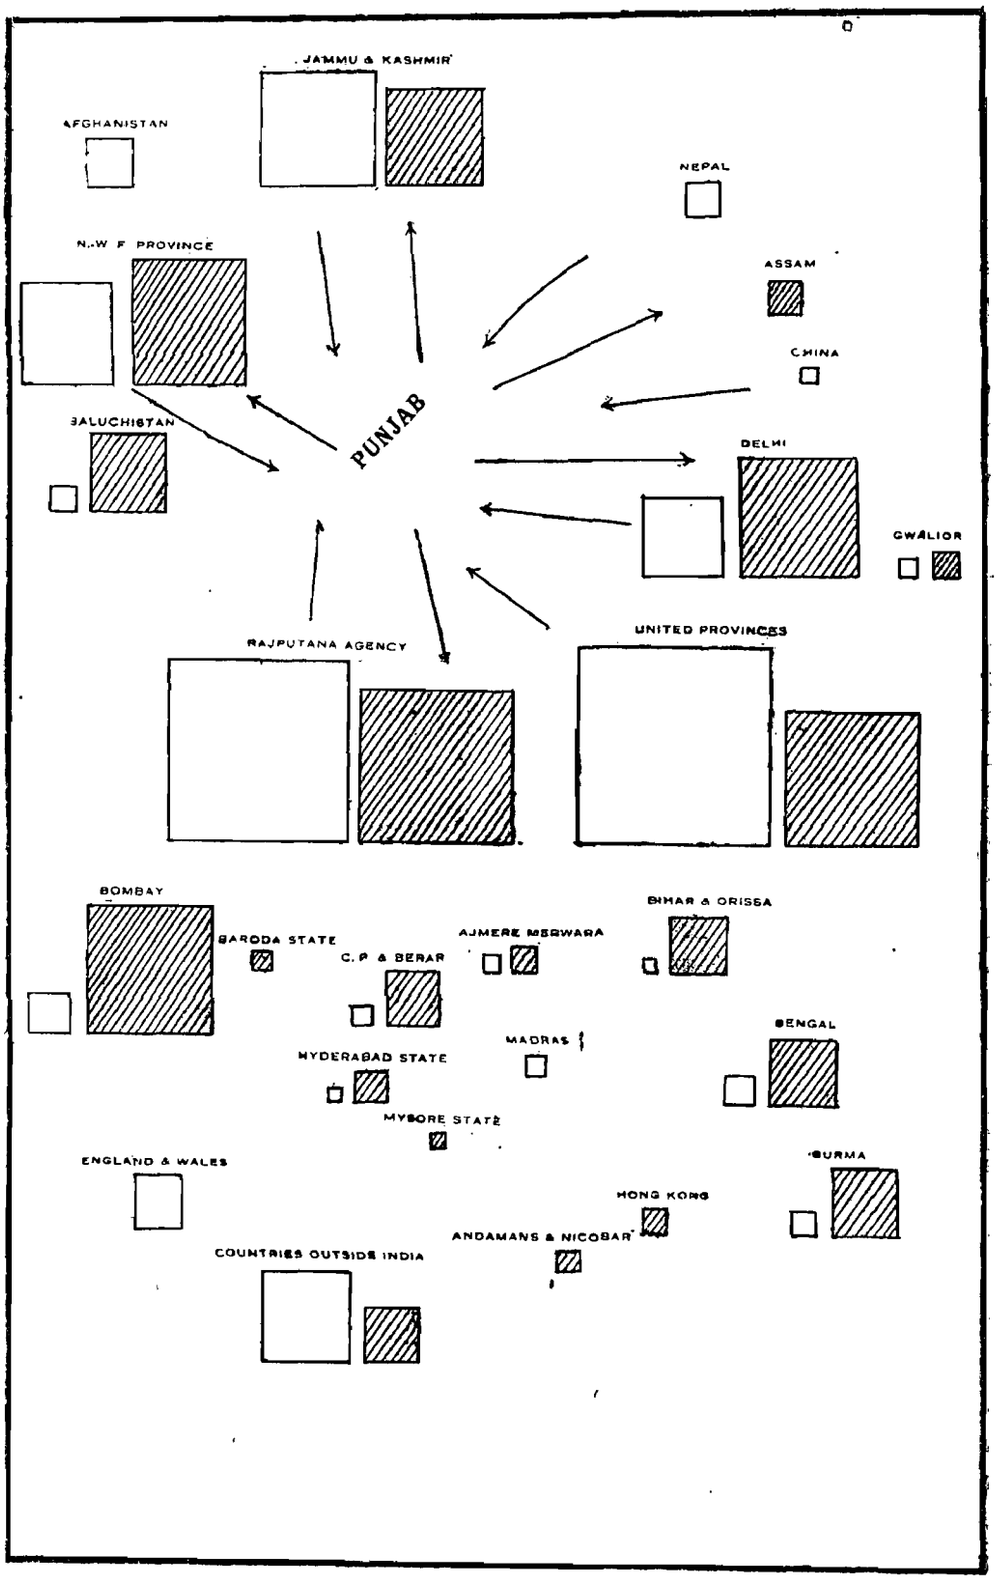

A death-rate of 20 *per mille* has been assumed for the old colonists of 1921 as well as for the new immigrants during the decade. Most of these persons may safely be assumed to be permanent migrants. It may be remarked that the number of persons migrating during the last decade has been calculated by the method explained in Section 6 of Chapter I. That method, in brief, is the application of a certain death-rate to the number of immigrants of the 1921 census. It can thus be realized that in case the stream of immigration into a colony district ceased altogether, the old immigrants would die and the population of the district will mostly consist of the district-born persons.

This would explain the reduction in the number of persons born in certain districts and enumerated in the colonies at a census when compared with the previous one. All the colonies when they grow beyond a certain stage are bound to show this result sooner or later.

The number of persons, who come from outside and settle in the Punjab, or of those, who leave the Province to settle elsewhere, is infinitesimal as compared with the number of migrants to canal colonies.

Reasons for Small Amount of Migration.

77. To get a clear idea of the amount of migration to and from this Province the reader is referred to the diagram below.

Migration to and from Punjab. Immigrants, white Squares. Emigrants, shaded Squares.

Scale, one square inch represents 200,000 persons.

The white squares represent immigrants to and the shaded squares emigrants from this Province. The area of the square is proportionate to the number of persons migrating.

The reason for the small amount of migration of all kinds was given in 1911 as the proverbial love of the Punjabi for his native land, which made him content with "*ghar ki adhi, bahir ki sari*" (half a loaf at home is as good as a whole away from it). The real reason however appears to be the one which stands in the way of urbanization, *viz.*, the dependence of the population on land for subsistence. Food being the primary necessity of human life keeps people attached and busy with the land. Leisure and off-season are unknown to a peasant, who has constantly to be near his crop to get a living wage out of it and sometimes even less. The few moments of leisure, which he can have, are spent in litigation, of which there is no dearth. Thus migration has no attractions for the agricultural population except when it is calculated to relieve the pressure on resources by holding out a better agricultural prospect and its attendant profits in the form of the lease, occupancy or ownership of colony land. A considerable portion of the population consists of artisans and menials, but even they are supported indirectly by agriculture, and they also do not find any better substitute for their work to entice them away from their homes.

SUBSIDIARY TABLE I.

Immigration to all Districts and States of the Province.

* Include the figures of those persons who returned their birth-place as "Punjab Unspecified."

SUBSIDIARY TABLE III.

Migration between the Province and other parts of India.

Note (1) *This table is divided into three parts—*

(*i*) Showing the total figures of immigration to and emigration from the whole of the Punjab (with details of British Territory and Punjab States) taking all the other Provinces of India together.

(*ii*) Containing details of migration between the Punjab Province (British Territory and Punjab States) and the British Territory of each of the other provinces.

(*iii*) Giving similar details of migration between Punjab Province (British Territory and Punjab States) and the Feudatory States of the other Provinces.

Note (2) In case of emigrants, persons returning their birth-place as "Punjab Unspecified" are included in the total figures of emigrants to each Province or State, and their number can be obtained by subtracting the total born in each of the two divisions of this Province from the total emigrants.

Province or State.	Immigrants to Punjab.			Emigrants from Punjab.			Excess (+) or Deficiency (—) of immigration over emigration.

and determine the mean of expectation of life for persons at various ages, but the fact is too patent not to be noticed.

Other Provinces.

The age distribution of this Province is compared in the marginal table with that obtaining in some of the other provinces. The Punjab has the highest proportion of children as well as old persons, except that females in Madras seem to be longer lived. The proportion of people in middle life is therefore naturally smaller in this Province than in others.

Number per 1,000 of both sexes.

Age-periods.	Punjab.		N. W. F.		Bengal.		Madras.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
0—5	82	77	79	78	77	79	71	73
5—10	71	61	75	61	71	63	65	64
10—20	117	96	117	91	108	106	102	103

50—60	33	24	28	21	26	22	30	29
60 and over	29	21	22	15	17	16	23	24

Mean Age.

85. Having seen the proportions of persons at different ages and drawn the rather serious inference about the expectation of life, we are led naturally to a study of the "mean age," by which is meant the age for a particular community or area, the number of persons below and above which is equal. This discussion has mainly an academic interest. A community with a comparatively large proportion of children will have a low mean age, while a regressive population though not actually longer-lived will have a comparatively higher mean age. The determination of the mean age is however not altogether valueless as it furnishes a basis of comparison with the figures of the past and gives an indication of the various forces operating on human life. The table in the margin shows the mean age of the population by main religions and sex for all censuses since 1881.* It will be seen that during the last fifty years the mean age has varied by no more than two years in a great majority of cases. The smallest figures are those for the year 1891, and the reason for this, as given in the 1911 Report (page 203), was that the preceding decade was characterised by a great rise in the birth-rate. This undoubtedly accounts for a part of the variation, but the real cause, as referred to above, was the reduction, during compilation by one year, of the ages of all individuals returned at the census of 1891 in order to obtain the figures according to the years of age completed. The mean age during the period, 1901—1921, seems to have increased slightly in the case of males and decreased in the case of females. The reason seems to have been the comparative impunity of males in middle and older ages from the ravages of plague and influenza, which are known to have caused heavy mortality among female adults. As compared with 1921 the mean age at this census has dropped by nearly one year in the case of males and a little more in the case of females on account of the great increase in the number of persons at earlier age-periods. The mean age would have been even lower if age had been recorded, as in 1921, according to the number of years completed.

Census.	*All Religions.*		Hindu.		Sikh.		Muslim.		Christian.

*The "mean age" has been calculated by the method described in India Administrative Report of the 1901 Census, page 390.

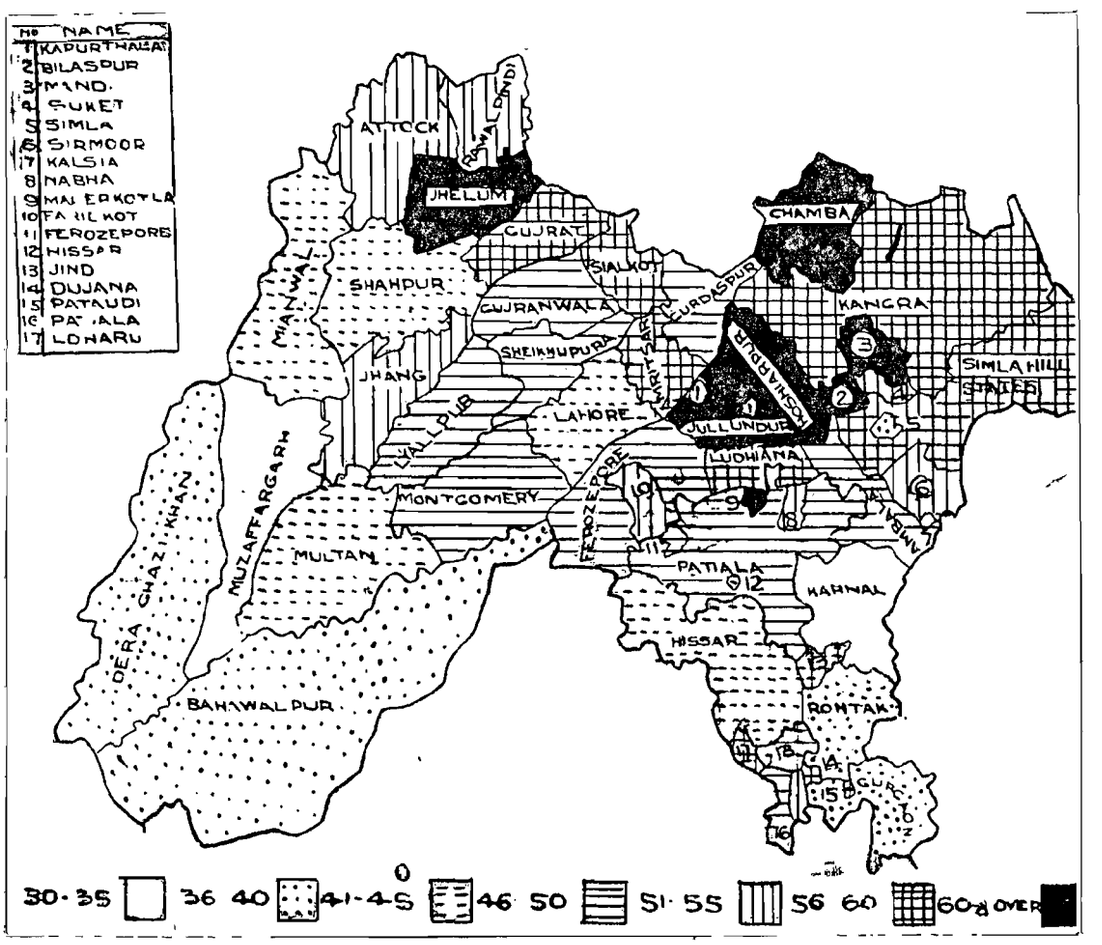

86. It will be of some interest to make a study of the mean age by Natural Divisions. Though it does not necessarily indicate longevity, it certainly furnishes a well-known basis for comparing the age distribution. From the table in the margin we see that the mean age is highest in the Himalayan Natural Division where the proportion of children is smallest, the Sub-Himalayan and the Indo-Gangetic Plain coming next in order. The mean age for the North-West Dry Area with a large amount of adult migration is curiously small. This is undoubtedly due to the great natural increase noticeable in the colonies where settlers have made permanent homes. The subject is further discussed in the next paragraph as well as in Chapter VI under the heading "Comparative fertility in different areas."

Mean Age in Natural Divisions.

Natural Division.	Mean age.
Punjab ..	23·7
Indo-Gangetic Plain West ..	23·8
Himalayan ..	25·6
Sub-Himalayan ..	24·3
North-West Dry Area ..	23·0

87. Generally speaking an area with the greatest proportion of persons over 60 may be regarded as most suited to longevity. It has already been pointed out that the age distribution is greatly affected by various considerations, such as large natural increase in particular areas and migration. The map below shows the number of persons per 1,000 of the total population of each district or state, who are over 60.

Longevity in Different Areas.

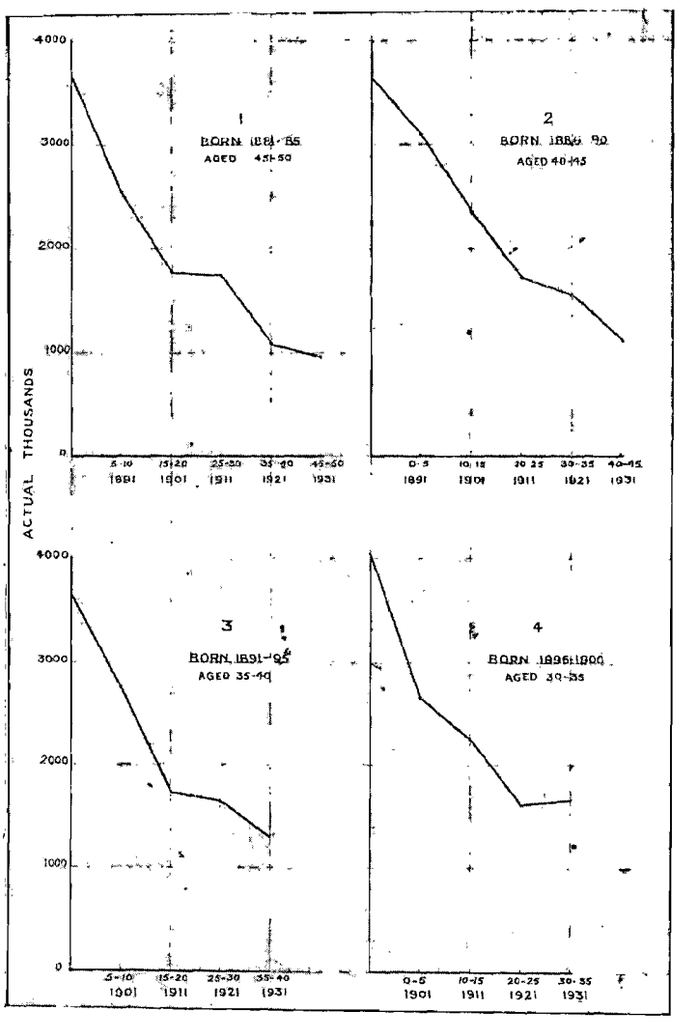

Number per mille of total population who are over 60.

The Districts of Karnal and Muzaffargarh, which as noticed in Chapter I have the smallest natural increase and which in consequence should have shown a larger proportion at other ages, possess the smallest proportion of persons over 60. The two districts may therefore be regarded as being most inimical to

longevity and very unhealthy. The proportion of older people is low all over the North-West Dry Area, partly because of the presence of a large number of middle-aged people as a result of migration or of children owing to larger natural increase. The true state of affairs about the comparative healthiness or otherwise of these areas will be known after a few more years when the conditions in the colonies will have settled down. The areas with the largest proportion of the older persons are the cooler Himalayan Division and the sub-montane districts of Hoshiarpur and Jhelum. The proportion of older people in Jullundur and Kapurthala is also fairly high, being partly attributable to the large number of young and middle-aged emigrants from these places. The same remarks apply to Sialkot, Gurdaspur and Ludhiana.

Quinquennial Births and Age-groups.

88. We might now study the age distribution with the help of vital statistics. Such a study is likely to throw light on the nature and extent of mis-statement of age both in the census and in the record of births and deaths, and will also give an indication of the ages, at which the death-rate is comparatively high or at which mis-statement is particularly great. The marginal table appearing below gives for each quinquennium the number of births recorded in the British Territory and the number of persons returned at corresponding age-periods at this census. It is evident that the latter represent the survivors of persons born in the quinquennium shown opposite them. To bring out the results more clearly the "life history" of persons born in each quinquennium during the period, 1881—1885 to 1896—1900, has been traced in the diagram above. The survivors of the persons born during the quinquennia, 1881—1885, 1886—1890, 1891—1895, 1896—1900, are now aged 45—50, 40—45, 35—40 and 30—35, respectively. The various degrees of mortality at different ages are evident from the four

Survivorship of persons born in each quinquennium during the period 1881—85 to 1896—1900.

Year.	Births.	Age-groups.	Population 1931.
1	2	3	4
1926—30	4,471,275	0—5	3,740,549
1921—25	4,187,411	5—10	3,143,832
1916—20	4,132,396	10—15	2,851,094

SUBSIDIARY TABLE V-A.

Proportion of Children under 10 and of persons over 60 to those aged 15—40 in certain religions ; also of married females aged 15—40 per 100 females by Natural Division.

Natural Division and Religion.	Proportion of children under 10, both sexes, per 100.				Proportion of persons aged 60 and over, per 100 aged 15—40.				Proportion of married females aged 15—40 per 100 females of all ages.

The number of females per 1,000 males in these villages is compared in the marginal table with the corresponding figures for 1911, and an all-round improvement is noticeable, the existing larger number of women being partly due to casual migration of women from other places, most of whom have been taken in marriage by the male residents of those villages.

7. Chuga Kalan	593	793
8. Bharana	589	737

The sex proportion for Sikh-Jats according to this census and that of 1921, worked out from the figures in compilation registers, is reproduced in the margin by tahsils for the four districts mentioned above. It is not possible to give the figures for earlier censuses. The figures quoted show an improvement almost everywhere, though the proportion of female children to boys in these districts is even now smaller among Sikhs than among other religions as indicated by the table lower in the margin.

Neglect of Females.

96. The question of neglect of females would be best studied by a comparison of the number of females with the number of males at given ages. The figures of age, as was pointed out in the last Chapter, are, however, full of serious errors due to mis-statement. In the same Chapter was also explained the attempt made as well as the measure of success attained at this census to free the figures as far as possible from those errors. The errors still existing is probably in ages 15—20 or thereabouts, which generally contain the greatest amount of mis-statement. The proportion of females per 1,000 males at different ages is given in the table in the margin and the graph below it illustrates the same, a curve therein showing the proportion in accordance with the recorded statistics of birth. By a glance at these proportions we find that the females aged 0—5 compared to males of the same age are as 959 : 1,000. Thus the proportion is higher than the proportion at birth, which as we noticed was 894 per thousand. This variation in the proportion signifies one of the two things, *viz.*, either the record of female births is more defective than that of males, or that males die at a greater rate than females up to the age of 5. Though there would seem to be some defect in the recording of female births, the high death-rate among males below 5 is borne out by the death-rates, published by the Public Health Department and reproduced in Subsidiary Table IX to Chapter IV.

15—20 ..	820	65—70 ..	695
20—25 ..	848	70 and over ..	771

Number of females per mille of males at different ages together with quinquennial sex proportion between recorded births of both sexes.

The proportion in the next quinquennial age-period drops to 859 per 1,000 males as against 892 per 1,000, the ratio at the time of the birth of these girls. It would thus appear that in ages 5—10 girls die at a greater rate than boys. This fact is also borne out by the published death-rates. Female children suffered particularly more than male children during the plague epidemic of 1924, and the general death-rate is also higher among girls mainly because they stay at home while their brothers spend much time out-doors.

The proportion of females at ages 10—15 is 814 per 1,000 males as opposed to 900 for these girls at the time of birth. The proportion at this quinquennium is even lower than that for the last quinquennium, being partly due to the return

of age as 10 or 12 in cases where the girl is unmarried and its jumping to 20 or so if she is married and especially if she has got a baby or two. Small as the proportion in this age-group is it is higher than the proportion for the corresponding age-period at last census, which was only 750. The age figures then were unsmoothed and the plumping at 15 went into the next higher age-group.

The next age-group of 15—20 is the one in which the great majority of girls get married (as we shall see in the next Chapter), and during which the mortality due to early child-bearing is considerable. The proportion of females to 1,000 males in this age-period is no more than 820 as against 913 at birth. This, however, is a little higher than the proportion at ages 10—15, and as already explained is mainly due to the return of ages as 20 or so on the part of young mothers, some of whom as a matter of fact belong to the earlier age-period. This plumping is so much in evidence that it seems even to wipe out the effect of higher death-rate due to child-birth. The female death-rate for this age-period is about 4 *per mille* higher than that of males as shown in the Subsidiary Table referred to above.

The proportion in ages 20—25 is greater than for ages 15—20, being 848, and seems in this as well as all the succeeding age-periods to be affected by migration. There is an excess of female immigration over emigration, though for both the sexes taken together the result is quite the other way (as noticed in Chapter III). To take the actual figures there were 273,982 Punjab-born women, enumerated in the other provinces or states of India, while 319,544 born in other provinces or states were enumerated in this Province. The bulk of this migration is, as observed in Chapter III, of the casual type, and the majority of the women concerned would naturally be 20 or above. This leads us to the question of the proportion of the sexes in the purely province-born, or in other words the "Natural Population" of the Province. We shall deal with this subject in a subsequent paragraph, confining our attention for the present to the study of the sex proportion in higher ages.

In the remaining age-periods the proportion of females to 1,000 males goes on decreasing with the exception of the periods, 40—45 and 70 and over, though even in these it does not approach anything like the figures of the proportion at birth or during youth. The reason for this variation seems to be the comparatively large number of women returning ages 40—45 as a final effort to appear young. The reason for the large number returned at older ages (70 and over) is the over statement of age to hide premature senility or to claim the respect due to old age. This latter tendency would automatically operate to reduce the number and consequently the proportion in ages immediately preceding the age-group 70 and over. The sudden drop in the proportion at ages 30—35 is due to the popularity of these ages among males and not particularly to any increase in female mortality.

Thus we find that with the exception of certain age-groups, pointed out above, the proportion of females goes on decreasing till it becomes markedly lower than the proportion at birth. The deaths among males continue at different ages and at different rates, and the reduction in the proportion noticeable among females is attributable to varying rates of mortality among them at different periods of life due more or less to causes peculiar to their sex.

help the reader to form his own opinion as to the causes of the disparity. The table in the margin compares the number of females per 1,000 males in this Province with the corresponding figures of certain other Indian provinces and some foreign countries. It will be seen that of the major Indian provinces the Punjab has the smallest proportion of females. The sex proportion in India seems to increase as we move to the east or to the south. Perhaps the preponderance of males in the Punjab is due to its peculiar requirements, the land of five rivers not far removed from the Passes in the North-West being admittedly the gateway and sword-hand of India.

Females per 1,000 Males.

Province. 1	1931. 2	Foreign Countries (year of last census). 3	
Punjab ..	831	England and Wales (1931) ..	1,087

Central Provinces ..	1,000		
Central India Agency ..	948		
Rajputana ..	908		

Turning to the figures of foreign countries we find a large excess of females over males in European countries. We know that in these very countries the birth-rate has been declining of late. There is also present a contributory cause in the form of male emigration.

The number of females in Japan is fairly equal to males and the proportion would be lower and something akin to that obtaining in India, if all the Japanese males were to stay at home. Japan has had a phenomenal rise in population in the last fifty years, and there is a great pressure of the population on its resources, resulting in the well-known efforts of the Japanese to found colonies in Manchuria. The poorer countries with a large natural increase would thus appear to have a fewer number of females. The sex proportion in countries such as the United States of America and Australia is, of course, greatly affected by the large amount of male immigration.

Sex Proportion in Different Localities.

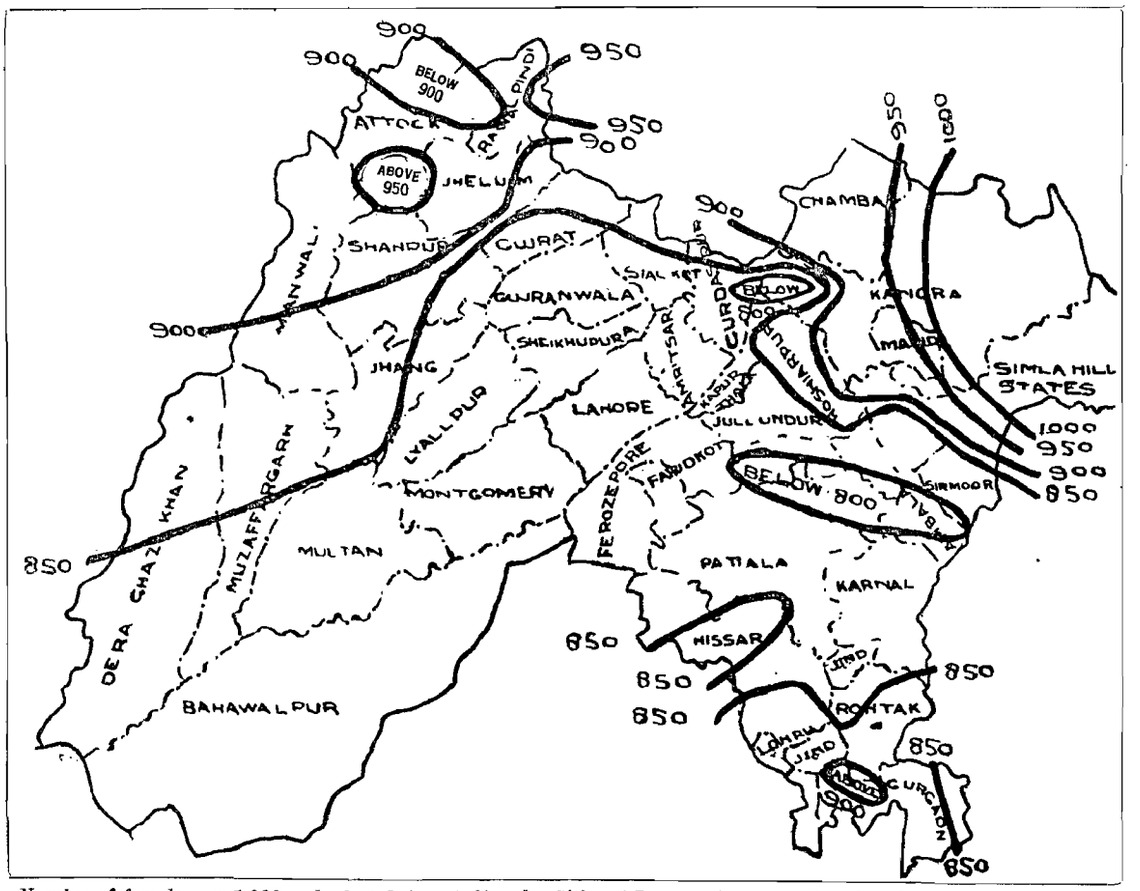

100. The proportion of the sexes is not uniform in the various parts of this Province, as is evidenced by the figures in the margin. The proportion of women is highest in the cooler Himalayan Natural Division, where there is always the smallest natural increase. It is smallest in the Indo-Gangetic Plain West, which has large urban areas, and if the population of the cities of Lahore and Amritsar and the towns of Jullundur, Ferozepore, Ludhiana and Gujranwala, all situated in this division, is excluded, the proportion in the remaining area will rise from 813 to 830. The proportion in the North-West Dry Area is surprisingly high for a tract, which has a great amount of immigration, indicating that the immigrants consist of fairly equal numbers of both sexes. The fact that the female proportion in this tract has an upward tendency points to the permanent nature of the immigration. This of course is natural as immigrants are for the most part agriculturists, who from the very nature of the industry must remain on the land, which they cultivate. The proportion in the Sub-Himalayan Division is lower only than that in the Himalayan, but is no doubt affected to a certain extent by emigration which reduces the number of males.

Females per 1,000 Males.

Natural Division. 1	1931. 2	1921. 3	1911. 4
Punjab ..	*831*	*828*	*817*
Himalayan ..	906	907	901
Sub-Himalayan ..	847	852	827
North-West Dry Area	831	827	825
Indo-Gangetic Plain West	813	805	795

Sex Proportion in Smaller Units.

101. The sex proportion for the districts and states is in keeping with the proportion obtaining in the Natural Divisions, in which they are situated, though large urban areas irrespective of locality have the effect of reducing the proportion of females. The figures for each district and state are given in Subsidiary Table I at the end of this Chapter, but a clear idea of the proportion of females may be obtained from the map below, which shows the sex

Number of females per 1,000 males by tahsil excluding the Cities of Lahore, Amritsar, Rawalpindi, Sialkot and Multan.

proportion by isopleths. The figures of tahsils have been used in order better to co-ordinate the results as district averages are sometimes not a true index of the conditions prevalent in the different parts. The population of the three cities, Lahore, Amritsar and Multan, and the towns of Rawalpindi and Sialkot (including cantonments) has been excluded to remove the extreme effect of urbanization.

Sex Proportion by Religion and Localities.

102. The only matter now remaining for consideration is the proportion of sexes among different religions and castes or tribes. In the margin is reproduced the number of females per 1,000 males for main religions and Natural Divisions as well as British Territory and Punjab States for the censuses of 1931 and 1921. The proportion of women among Muslims is the highest, as it was in 1921, though it has decreased in all Natural Divisions except the North-West Dry Area. Hindus follow next, and their proportion has risen in all Natural Divisions, while Christians in spite of the comparatively larger number of European males come third. The Sikhs have the smallest number of females, but their proportion is greater than in 1921 in all Divisions. The proportion of Hindus

Natural Division.	Hindu.		Muslim.		Sikh.		Christian.	
	1931.	1921.	1931.	1921.	1931.	1921.	1931.	1921.
1	2	3	4	5	6	7	8	9
Punjab ..	*835*	*829*	*839*	*844*	*793*	*765*	*803*	*786*
Indo-Gangetic Plain	812	808	825	827	790	755	814	796
Himalayan	917	913	725	737	717	694	900	1,111
Sub-Himalayan ..	832	823	863	880	804	791	785	765
North-West Dry Area	813	801	838	835	792	784	804	786
British Territory ..	826	823	841	847	799	770	803	786
Punjab States ..	861	847	826	821	776	749	799	837

is highest in the Himalayan Division, which is almost exclusively a Hindu tract. The number of Sikh and Muslim females in this Division is particularly low, indicating that the followers of these religions are for the greater part immigrants, who have left their womenfolk behind. On the other hand the presence of a large proportion of Christian females is mainly due to permanent Indian Christian population of hill resorts and also to the fact that the families of British soldiers serving in outlying and exposed places on the North-Western frontier remain at some hill-stations in the Punjab during the winter.

In the Sub-Himalayan Division the proportion of females is comparatively higher among the prevailing religions, namely, Hindu, Muslim and Sikh. Here the proportion of the Christians is considerably affected by the large excess in the number of European males over females. The proportion among Europeans is 354 females to 1,000 males in the Province and 315 in the Sub-Himalayan Division.

In the Indo-Gangetic Plain and the North-West Dry Area, the proportion has risen in all religions except in the former Division among Muslims. For the proportion of sexes among these religions by age-periods for the whole Province and each Natural Division reference may be made to Subsidiary Tables II and III at the end of this Chapter.

Sex Proportion by Caste.

103. Just as the sex proportion varies in various localities and religions, so it does in the case of different castes or tribes. Subsidiary Table IV at the end of this Chapter shows the proportion of females per 1,000 males for the main castes and for each religion, to which they belong, and at different age-periods. For facility of reference the proportion for the population of all ages for the most numerous castes as well as the four main criminal tribes are given in the margin. The Kanets, who are found chiefly in the Kangra District of the Himalayan Division, have the highest proportion, *i.e.*, 941 females per 1,000 males. The Dagi and Koli, another Himalayan tribe, shows the next highest proportion of 929. Bawarias, who are a criminal tribe, show the high proportion of 920 females to 1,000 males, but this figure is to some extent unreal as many of the adult males of this caste abscond from their homes in order to escape the provisions of the Criminal Tribes Act and when enumerated would be careful not to return their real caste. Awans with a large number of males serving away from home, in the Army or the Police, and the itinerant Mirasi, many of whose males are often absent from their homes for considerable periods on professional trips and if questioned in remote places by a census enumerator would more often than not return their caste as Quraishi, show the next highest proportion of 871. The Aroras, a trading and commercial class, have a comparatively high proportion of females, *i.e.*, 865.

CHAPTER VI.

CIVIL CONDITION.

104. Introductory. 105. Movement in actual figures. 106. Proportional distribution according to age and civil condition. 107. Age at marriage. 108. Age at marriage from census data. 109. Proportion of sexes in marriageable population. 110. Polygamy. 111. Polyandry. 112. Special inquiry into marriage and fertility. 113. Size of the family correlated to occupation of husband. 114. Size of the family by religion and class. 115. Size of the family according to age of wife at marriage. 116. The amount of Sterility. 117. Duration of marriages and size of family. 118. Fertility data compared with general census. 119. The widowed. 120. Proportion of widows among females of main religions. 121. Proportion of widows in different areas. 122. Proportion of widows among different castes. 123. Widow remarriage.

Reference to Statistics.

Imperial Table VII gives the absolute figures of civil condition by main religions and age-periods for the whole Province, the British Territory, the Punjab States and each district and state as well as selected cities and towns.

Imperial Table VIII gives the same information, though with slightly different age-groups, as Imperial Table VII for selected castes by locality.

Subsidiary Table I gives distribution by civil condition of 1,000 of each sex, religion and main age-periods at each of the last five censuses.

Subsidiary Table II gives distribution by civil condition of 1,000 of each sex at certain ages in each religion and Natural Division.

Subsidiary Table III gives distribution by main age-periods and civil condition of 10,000 of each sex and religion.

Subsidiary Table IV gives proportion of sexes by civil condition at certain ages for religions and Natural Divisions.

Subsidiary Table V gives distribution by civil condition of 1,000 of each sex at certain ages for selected castes.

Statistics obtained at a special enquiry into marriage and fertility are reproduced in the text as well as the unsmoothed figures of age and civil condition for the whole Province.

Introductory.

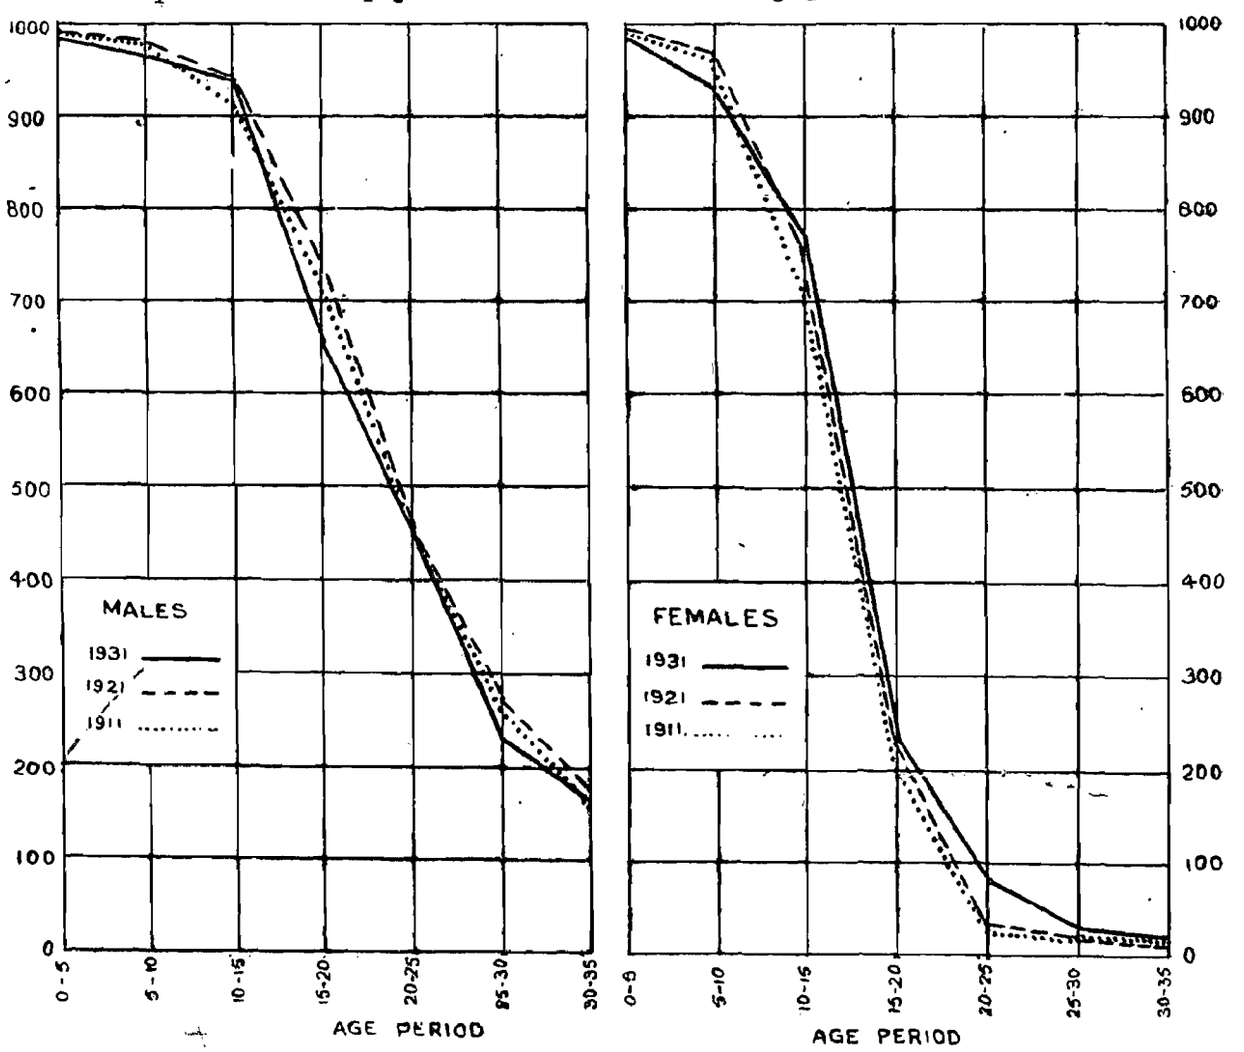

104. This Chapter deals with the marital condition of the population of the Punjab, or with the numbers of the married, unmarried and widowed at different ages and in different localities, religions and castes. The divorced persons who had not remarried were included among the widowed. Persons living as husband and wife, and recognised by custom as married, were to be treated as such though they had not gone through the ordinary formalities connected with marriage. The number of such marriages is believed however to be very very small and nothing in comparison to that found in European countries where some people do not go through any religious ceremony because they think it is not necessary in a state of nature. This is evidenced by the comparatively large number of children regarded by the law in European countries as illegitimate, though born to parents who are man and wife for all practical purposes. The customary marriage in this country is confined to the "*Karewa*" known locally by different names, which is the taking into wedlock of the widow of a deceased brother or some other near relative, such as a first cousin.

The Punjab Census Report of 1911 (p. 275) deals at length with the customs and ceremonies, performed at the time of marriage among different communities and castes. It is unnecessary to repeat them here except to mention that marriage is believed by a great majority of the people to be more or less a sacrament or a religious duty. Divorce is unknown to the Hindu law, as also among Sikhs and Jains, and even among Muslims though it is permissible the cases of divorce are few and far between and the compilation of separate figures is uncalled for.

Before we proceed to discuss the statistical material compiled at the census with regard to civil condition, it appears necessary to refer to a detail of compilation adopted at this census, which was a departure from the procedure of the previous censuses. In Imperial Table VII the figures of civil condition are combined with those of age. During the smoothing of age figures, as explained in Chapter IV, the age and civil condition figures were sorted directly into

septennial and quinquennial age-groups. To take an example, ages were sorted direct into groups such as 7—13 and 14—16, which during tabulation were halved to form the quinquennial age-period of 10—15, the other half of the age-period 7—13 together with ½ of the number in age-group 4—6 forming the age-group 5—10. This process though it improved the age returns, and on the whole the returns of civil condition, caused a slight swelling of the figures of the married and the widowed in the case of the too young, as explained below. It is obvious that there would be more married and widowed persons at the ages of 12 and 13 rather than at the ages of 7 and 8 and so a process, which divided the total number of the married and the widowed in age-group 7—13 equally into two parts and transferred one-half of the number to the age-group 5—10 would naturally give higher figures for the married and the widowed in the younger age-period. At the same time this process would reduce the number of such persons in the age-period 10—15. The figures of civil condition for ages 15—20 and 20—25 have not been so affected by the smoothing except that a certain number of unmarried females, who would in accordance with the world-wide practice return ages nearer 17 than 23, be transferred to age-group 20—25. The results obtained would therefore probably be nearer to the true state of affairs. The net result of smoothing is that a larger proportion of the population is found to be married or widowed at ages below 10 as compared to past censuses.

The effect of this change in procedure is brought out by the diagram below which shows for the last three censuses the proportion of the unmarried *per mille* of the population of each sex at each age-period below 15.

Proportion per mille of each sex at each age-period who were unmarried (1911—1931).

The proportion of the unmarried of ages 0—5 and 5—10 is now smaller among both sexes than at the two previous censuses. The proportion of the unmarried of both sexes for ages 10—15 is for the same reason greater than before. In the case of males the proportion of the unmarried among those aged 15—25 is slightly smaller on account of transfer of married males from higher ages, while the number of unmarried females in ages 15 and upwards appears to have increased.

Movement in Actual Figures.

105. The table in the margin shows the variation per cent. in the number of total unmarried, married and widowed for the last intercensal period as well as at different ages. The number of both the unmarried and the married has increased, while there is a small decrease n the number of the widowed. The decrease in the widows of ages 0—15 is particularly noticeable and may be due partly to improved method of tabulation and partly to the improvement in conditions. According to the law of averages the larger the number on which an average is based the more reliable is the result obtained. The number of the widowed under 15 is a case in point. Their total in the Province is 14,405 (males 6,974 and females 7,431), which is only a small fraction of the population. In such a case even a slight mistake in the posting of results during any stage of abstraction might cause a large percentage of error, while in the case of the figures of the unmarried of same ages, which are many hundred times larger, similar errors will counterbalance each other and leave the results practically unaffected.

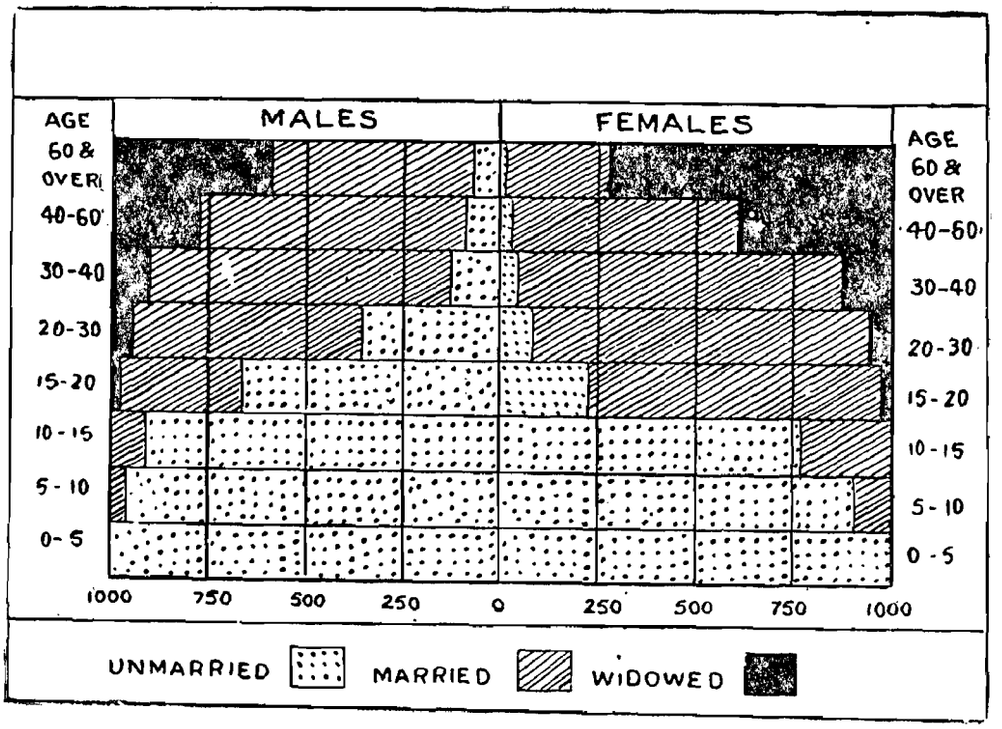

Increase or decrease per cent. during the decade 1921—1931.

Age-group.	Total.		Unmarried.		Married.		Widowed.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
1	2	3	4	5	6	7	8	9
All ages ..	*13·3*	*13·7*	*14·2*	*18·4*	*15·8*	*14·0*	*—2·1*	*—1·0*
0—15 ..	14·4	16·9	14·0	15·4	31·0	33·9	—20·3	—11·1
15—20 ..	24·7	34·4	12·4	34·0	58·8	35·3	27·5	9·9
20—25 ..	36·1	35·2	39·1	174·3	36·8	30·6	—5·0	—5·3
25—30 ..	12·3	12·2	—5·0	103·4	21·3	11·2	—5·5	4·8
30—40 ..	13·8	8·5	10·7	12·9	16·8	6·9	—2·2	9·8
40 and over	—·2	—3·7	3·1	65·7	·4	—5·3	—2·4	—3·1

Proceeding with the discussion we find that there is a noticeable increase in the number of the widowed aged 15—20, which is clearly due to the smoothing as male widowers of this age-period show the large rise of 27·5 per cent. over the figures of the last census, while the next higher age-group, 20—25, shows an actual decrease of 5 per cent. which is also met with in the widows of same age. The cause responsible for the increase in the case of the married below the age of 10 holds good equally in the case of the widowed in age-group 15—20, which seems to have gained at the expense of the next higher age-group 20—25. This displacement in the number of widowers is noticeable in all other higher age-groups. In the case of females the number of widows above 40 has slightly decreased, while there is increase at other ages though considerably smaller than the increase in total population except at ages 30—40.

Proportional Distribution According to Age and Civil Condition.

106. The diagram below shows the distribution of the male and

Civil condition per mille of each sex at each age-period 1931.

female population by age and civil condition, and at once supports the general view of the universality of marriage in India. The number of unmarried persons, specially females, in higher ages becomes very small, while owing to the comparatively short span of life in this country there is a large number of the widowed, particularly in ages over 40. Widow re-marriage is deprecated by a considerable section of the public, and this fact tends to increase the number of widows; elderly males, widowed or otherwise, generally wed young women, and as older people are likely to depart first their death increases the number of widows still further.

The table in the margin gives the percentage of the married among those aged 15—40 belonging to different religions. It appears that Ad-Dharmis have the greatest proportion of married persons in the reproductive period of life. The proportion among Hindus is higher than that among Muslims and Jains, which is about equal. Sikhs have fewer married males owing to the paucity of women among them, but have for the same reason nearly the highest proportion of married females. The Christians, Buddhists and Zoroastrians have the fewest of both sexes married.

Religion. 1	2 Males.	3 Females.
All Religions ..	*59*	*85*

Age at Marriage.

107. The number of persons returned as married below the age of 15 has increased at a rate more than double that of the general rise in total population (*vide* the table in paragraph 105), and this in spite of the legislative measure* recently passed to prohibit males below 18 and females below 14 from marrying. Perhaps this measure was in a way responsible for swelling the number by accelerating early marriages in anticipation of the prohibition.

*The Sarda Act was passed in 1928, but did not come into force until 1st April 1930.

The total unsmoothed figures of civil condition for the Province are reproduced in the table below.

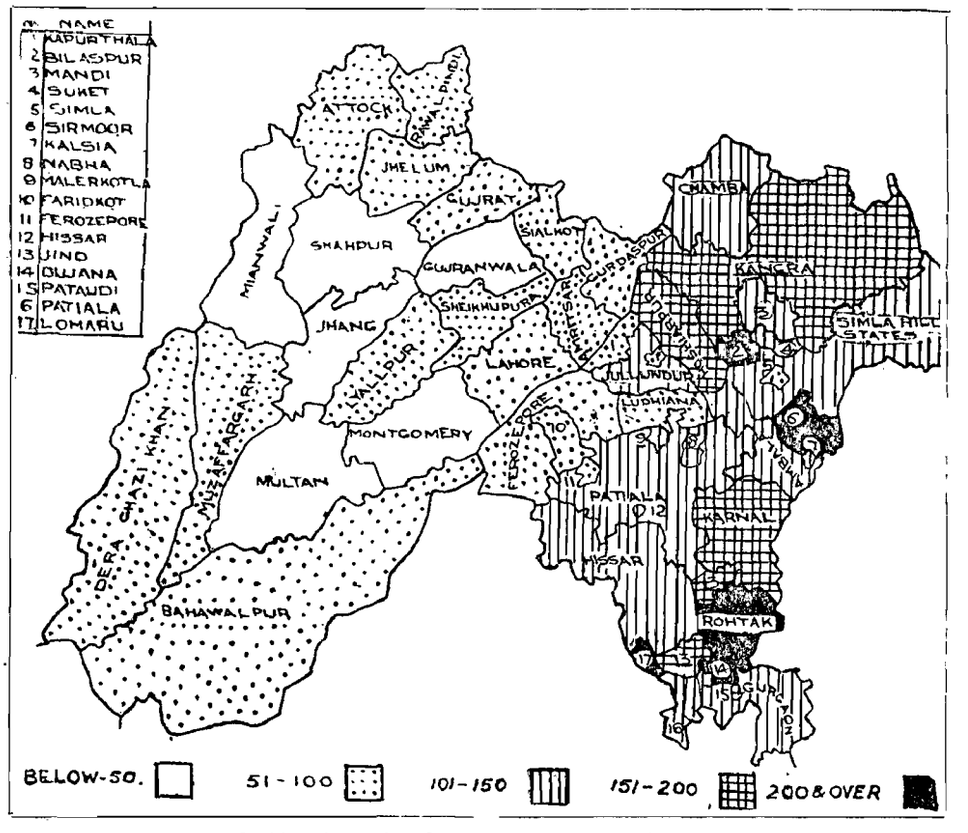

Unsmoothed figures by civil condition and age (whole Province).

It is significant that while only 394,750 persons of both sexes were returned as married up to ages 0—13, 625,498 were so returned at ages 14—16. The latter are the ages at which marriage of females is permissible under the recent legislation, and at which many people are actually married. A contributory cause for the large number doubtless is preference for 15 as the year of age. At last census the number of those recorded as married among those aged 0—14 was 531,649 and the corresponding figure for the present census for ages 0—15, after smoothing comes to 707,499. In the case of both sexes those returning themselves as married at ages 14—16 some were undoubtedly younger than 15 while others might be older. The smoothing has thus corrected the age as well as the civil condition of a certain number, who may not have really attained these ages but returned them owing to their being married.

That the people are returning in large numbers the ages at which marriage is permissible under the law is an indication of the new piece of legislation having become widely known. The large number of marriages celebrated in a hurry before the Act came into operation might however be regarded as a transitory step, and it can be reasonably hoped that cases of early marriage will be less numerous at the next census.

The map below shows the local distribution of married and widowed females below the age of 15. It indicates where the age at marriage of females is relatively low. The results are given in terms of the proportion of married and widowed females aged 0—15 *per mille* of the total female population of all ages. Early marriages of females seem to be in vogue in the Eastern Punjab, particularly in Rohtak District and Sirmoor and Bilaspur States. In the upper reaches of Sirmoor marriages of infants are reported to be common. The age of marriage is comparatively low in Jind, Karnal, Hoshiarpur and Kangra. It is a little higher in Ambala, Patiala, Hissar and Gurgaon, and is highest in the western or the Muslim part of the Province.

Married and widowed females of ages 0—15 per 1,000 females all ages.

Age at Marriage from Census Data.

108. There being no registration of marriages in India, statistics are not available wherewith to ascertain directly the average age of the bride or bridegroom at the time of wedding. The census statistics, however, show the proportion of the population that is married or unmarried at each age, and by making certain assumptions we can use them to estimate the average ages, at which marriage takes place. The calculations below give the average age of marriage for females and males of all religions; the reader who is interested in the subject may work out for himself the average age in each religion by the same method. This method is the same as that given in the Bengal Census Report of 1921 (pages 266 to 269) and is reproduced below for facility of reference.

If U_x is the number of females whether unmarried, married or widowed at the age of x, *i.e.*, between x and x +1 years old, and P_x is the proportion between the ages of x and x+1 returned as married or widowed, then $P_x U_x$ is the number of females between x and x+1, who have been married. Assuming that mortality rates are the same for married as for unmarried females and that the age distribution of females remains the same for a year, then of the females between x and x+1 who had been married $\frac{U_{x+1}}{U_x} \times P_x U_x$ or $U_{x+1} P_x$ survive a year and the number of married females between the ages of x+1 and x+2 is

$U_{x+1}\ P_{x+1}$. The difference between these two quantities $U_{x+1}\ P_x$ and $U_{x+1}\ P_{x+1}$ must be the number of marriages which took place during the year among the women who were aged x at the beginning, and the average age at which these marriages took place would be almost exactly x+1 years. We, therefore, account for all the marriages which took place in the year by the series $\lesssim U_{x+1}\ (P_{x+1}-P_x)$.

The marriages $U_{x+1}\ (P_{x+1}-P_x)$ took place at the average age x+1, and $U_{x+2}(P_{x+2}-P_{x+1})$ at the average age x+2 and so on.

Thus the average age at which the marriages took place will be $\frac{\lesssim U_x\ (P_x-P_{x-1})x}{\lesssim U_x\ (P_x-P_{x-1})}$

The actual calculation for the average age of bride and bridegroom in the Province for all religions is given in the following two tables. The proportion P_x in column 2 is obtained by running a smooth curve through the points determined by the proportions of the married and widowed in quinquennial age-periods, and the figures in column 3 are taken from the graduated age distribution for females and males given in Subsidiary Table XI to Chapter IV.

Calculation of the average age of the bride at marriage.

Age.	Married and widowed per 1,000.	Number living per 100,000 of the female population.	Number of marriages which take place when bride's age is between $x-\frac{1}{2}$ and $x+\frac{1}{2}$ (average age x).		Age.	Married and widowed per 1,000.	Number living per 100,000 of the female population.	Number of marriages which take place when bride's age is between $x-\frac{1}{2}$ and $x+\frac{1}{2}$ (average age x.)	
x to x+1	P_x	U_x	$U_x\ (P_x-P_{x-1})$	$U_x(P_x-P_{x-1})x$	x to x+1	P_x	U_x	$U_x(P_x-P_{x-1})$	$U_x(P_x-P_{x-1})x$
1	2	3	4	5	1	2	3	4	5
0—1	0	2,492	0	0	18—19	795	2,458	86	1,548
1—2	4	2,822	11	11	19—20	820	862	22	418
2—3	15	3,096	34	68	20—21	850	4,226	127	2,540
3—4	26	3,530	39	117	21—22	875	530	13	273
4—5	40	3,020	42	168	22—23	895	1,996	40	880
5—6	60	3,010	60	300	23—24	915	754	15	345
6—7	76	2,880	46	276	24—25	930	1,170	18	432
7—8	95	2,760	52	364	25—26	945	4,540	68	1,700
8—9	120	3,098	77	616	26—27	955	1,074	11	286
9—10	150	2,264	68	612	27—28	965	730	7	189
10—11	180	3,000	90	900	28—29	970	1,360	7	196
11—12	220	1,554	62	682	29—30	974	392	2	58
12—13	380	2,944	471	5,652	30—31	975	5,114	5	150
13—14	505	1,728	216	2,808	31—32	980	204	1	31
14—15	595	2,118	191	2,674	32—33	981	1,244	1	32
15—16	666	2,290	163	2,445	33—34	985	262	1	33
16—17	715	2,086	102	1,632	34—35	985	426	0	0
17—18	760	1,156	52	884					

The figures in column 4 become very small after the age 34 and it is useless to carry the series any further.

Then $\frac{\Sigma U_x (P_x - P_{x-1})^x}{\Sigma U_x (P_x - P_{x-1})} = \frac{29,320}{2,200} = 13{\cdot}33$ years, and thus the average age of the bride at marriage in the Province is 13·33 years.

Calculation of the average age of the bridegroom at marriage.

Age.	Married and widowed per 1,000.	Number living per 100,000 of the male population.	Number of marriages which take place when bridegroom's age is between x—½ and x+½ (average age x).		Age.	Married and widowed per 1,000.	Number living per 100,000 of the male population.	Number of marriages which take place when bridegroom's age is between x—½ and x+½ (average age x).	
x to x+1	P_x	U_x	$U_x (P_x - P_{x-1})$	$U_x (P_x - P_{x-1})^x$	x to x+1	P_x	U_x	$U_x (P_x - P_{x-1})$	$U_x (P_x - P_{x-1})_x$
1	2	3	4	5	1	2	3	4	5

7—8	25	2,696	27	189	25—26	700	4,002	160	4,000
8—9	35	3,108	31	248	26—27	740	1,318	53	1,378
9—10	45	2,154	22	198	27—28	775	836	29	783
10—11	60	3,178	48	480	28—29	795	1,308	26	728
11—12	75	1,700	26	286	29—30	815	410	8	232
12—13	105	3,196	96	1,152	30—31	820	4,782	24	720
13—14	150	1,964	88	1,144	31—32	860	362	14	434
14—15	210	2,256	135	1,890	32—33	875	1,386	21	672
15—16	270	2,622	157	2,355	33—34	885	438	4	132
16—17	320	2,210	110	1,760	34—35	890	394	2	68
17—18	365	1,236	56	952					

Here $\frac{\Sigma U_x (P_x - P_{x-1})^x}{\Sigma U_x (P_x - P_{x-1})} = \frac{29,629}{1,648} = 17{\cdot}98$ years and thus the average age of the bridegroom is 17·98 years.

These calculations, which give the average age at marriage for females as 13·33 and for males as 17·98 years, are based on two assumptions, *viz.*, (*a*) the age distribution does not change appreciably from year to year, and (*b*) the mortality rates are the same among the married as among the unmarried. The first assumption is not far from the truth. We have not used the differences between the proportions of the population at one age and those at another, and if the distribution changes slightly it does not affect the result at all appreciably. The second assumption is somewhat arbitrary, as undoubtedly the mortality rates are higher in the ages of early maturity in the case of married females than of the unmarried. But the number of females who are married and survive a year would be affected only slightly. The over-statement in the ages of married girls of younger age results in an under-estimate of the proportion of married in the age-period 10—15, thus raising a little the average age of the bride at marriage. The figures of males are practically free from this defect. The disparity between average ages is, therefore, probably less than 4·65 years brought out by our calculations. For practical purposes we may assume that the average age of the bride at marriage is 13½ years and that of the bridegroom a little under 18.

Proportion of Sexes in Marriageable Population.

109. In the last Chapter we discussed at length the proportion of the sexes at different ages and among different religions, and other subjects of a kindred type. Here it may be useful to see the proportion of the sexes in the

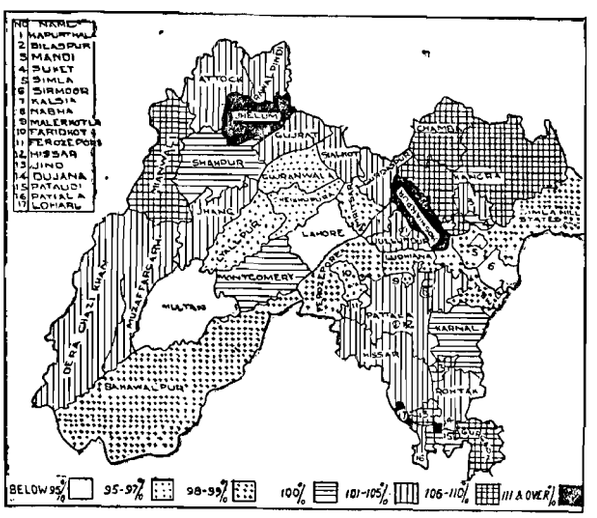

marriageable population. The scarcity of females in the Province is well-known, and directly or indirectly is the cause of various complications from an administrator's standpoint. The number of marriageable males (unmarried as well as widowed) of the ages 15 to 40—to ignore for the time being those who are already married or are older but still wishful for marriage—as compared to unmarried females of marriageable ages (*i.e.*, 15—40) is as 5,735 : 1,000 or about six times as much. Even if the widows aged 15 to 40 were to remarry freely the proportion would still be as high as 3,252 males to 1,000 females. The situation would thus be greatly relieved, but it would not approach anything like the conditions in some foreign countries where the difficulty is to secure husbands. In the case of different religions the proportion of marriageable males per thousand unmarried females (aged 15—40) is 8,804 among Hindus, 6,635 among Sikhs, 5,755 among Jains, 4,702 among Muslims and 3,943 among Christians. If the number of widows aged 15—40 could be available, as it certainly is to some extent among Muslims, Christians and Hindu and Sikh Jats, the proportion would drop to 3,240 among Hindus, 4,178 among Sikhs, 2,321 among Jains, 3,062 among Muslims and 3,142 among Christians.

Polygamy.

110. There are 5,964,546 married males and 5,994,777 married females in the Province. In other words there are 30,231 more married females than married males, which means an excess of ·5 per cent. This is accounted for by the excessive temporary or semi-permanent emigration of males as compared to females. It is thus obvious that only a very small amount of this excess could be due to polygamy. The figures of married males and females among the main religions are given in the margin. The Muslims, generally believed to be the most polygamous, contain ·4 per cent. more wives than husbands while in the case of Sikhs this percentage is 2·6, mainly due to a comparatively larger proportion of Sikhs who emigrate. The excess in both cases is small compared to the actual numbers of the married, and shows that polygamy is not practised in the Province to any appreciable extent. Hindus and Christians show a larger number of husbands than wives. This may be due in the case of Hindus to the presence of labourers from Rajputana, who do not in all cases bring out their wives. The figures of Christians show fewer wives on account of the inclusion among them of European immigrants whose wives are often away in Europe.

Muslim ..	3,068,096	3,081,653
Christian ..	79,729	77,585

The map in the margin shows the percentage of married females to married males in each district and state. The districts with more than 100 married females per 100 married males may, in the absence of special causes, be regarded as comparatively more polygamous than others. Prominent in this respect are Jhelum and Hoshiarpur, in both of which the disparity may be to a considerable extent due to the absence of husbands from their homes. It has been mentioned in Section 7

Number of married females to 100 married males.

of Chapter I that the Army obtains a large number of recruits from Jhelum, while private employment and military service draw away numerous adult males from Hoshiarpur and Kangra. The percentage is also high in Chamba and Bilaspur States where the proportion of women is comparatively larger and polygamy among certain classes well known, wives being a valuable asset to those engaged in agriculture. The Mianwali District in the west and Gurgaon in the east also show a high percentage. The main reason in the case of the former is probably polygamy, and in the case of the latter emigration of males to other districts in search of labour, resulting from insecure agricultural conditions.

Polyandry.

111. The practice of ploy andry was believed to be prevalent in certain parts of the Himalayas and the territory known as the Malwa, situated between the Sutlej and the Ghaggar rivers (in Ambala District). The percentage of married females to males in the map in the last paragraph shows Bashahr, Sirmoor, Ambala, Kalsia, Ludhiana, Maler Kotla, Ferozepore, Faridkot and Amritsar as having a smaller number of wives than husbands. The proportion of married men in these areas would be still greater but for the fact that males predominate in the large emigration from those areas. This smaller percentage of married females undoubtedly creates a suspicion of polyandry, particularly in the hill tracts. There are certain other districts and states such as Simla, Multan, Lyallpur, Gujranwala, Sheikhupura, Lahore and Bahawalpur, which also show a larger number of married males compared to married females. These include areas, which have been developing as a result of canal irrigation or which contain large towns, and in both cases the element of immigration is substantial, resulting in the presence of more married males than married females. Polyandry obviously plays no part in the disparity of the proportions in these areas.

Special Enquiry into Marriage and Fertility.

112. Reference was made in Chapter V to a special enquiry into marriage and fertility made in typical areas of each district and state. As a result of this enquiry six tables have been prepared; the table relating to the sex of the first-born appeared in Chapter V, while the others are reproduced in paragraphs that follow. According to the statistics given the average number of children born per 100 wives of all religions works out at 396. In some cases a marriage no doubt results in the birth of twice as many children or even more, while in a number of cases the wedlock is altogether barren. No doubt, averages based on a large number of cases examined produce results that indicate in the long run the normal size of the family.

Size of the Family Correlated to Occupation of Husband.

113. The table below shows the classification, according to the occupation of the husband, of 173,432 families, examined in the various districts and states. The families of all religions and castes have been lumped together, all occupations

TABLE II.—SIZE OF FAMILIES BY OCCUPATION OF HUSBAND.

Fertility Data Compared with General Census.

118. While it is impossible to compare all the figures, collected at this special enquiry, with the general census results a comparison is possible in certain aspects. For instance, as already noticed on an average one child is born to a married woman every five years. Taking all the married females alive of ages of 15 –45 and assuming that all the children born during the last ten years were born to them we get the results shown in the margin. Actually some of the women might have died leaving children, while some who had children born to them during the last ten years may now be over 45. We find that for 100 women of all religions, according to the figures of the general census, the number of children born comes to 224 or a little over two children in ten years. The effect of infant mortality is also apparent from the figures in the third column, and we find that out of 224 children born 178 survive to be included in the population under ten recorded at this census. The figures of Hindus and Muslims are also given ; the former comprise Sikhs and Jains as well, there being no separate birth record for these religions. This shows that Muslims had a slightly larger number of children than Hindus. This is probably true as the record made at the time of birth would not like the special enquiry held many years after their death omit the children of Muslims. The comparative survival rates are also clearly brought out. Compared to this according to the special enquiry the number of children born to 100 wives with a ten years' duration of marriage comes to 194. The figures for England and Wales, needless to say, present a great contrast.

England and Wales (1921).	176	149

The Widowed

119. In the remaining paragraphs of this Chapter we shall take up the study of the subject of the widowed. At this census there were 2,822 widows below ten, 7,431 below fifteen and 26,602 below twenty. These figures are pathetic enough, but they seem insignificant when we realise that in ages above 40 every other woman is a widow. The contrast that these figures present with the number of widows in England and Wales is most striking indeed, and in the table below is given the distribution by age and civil condition of 10,000 persons of this Province according to the census of 1931 and of England and Wales for the census of 1921. The figures indicate the proportionate number of each sex unmarried, married and widowed at different ages, and whereas they facilitate comparisons of the other two civil conditions as well they prominently bring to notice the comparatively high proportion of widows in this Province.

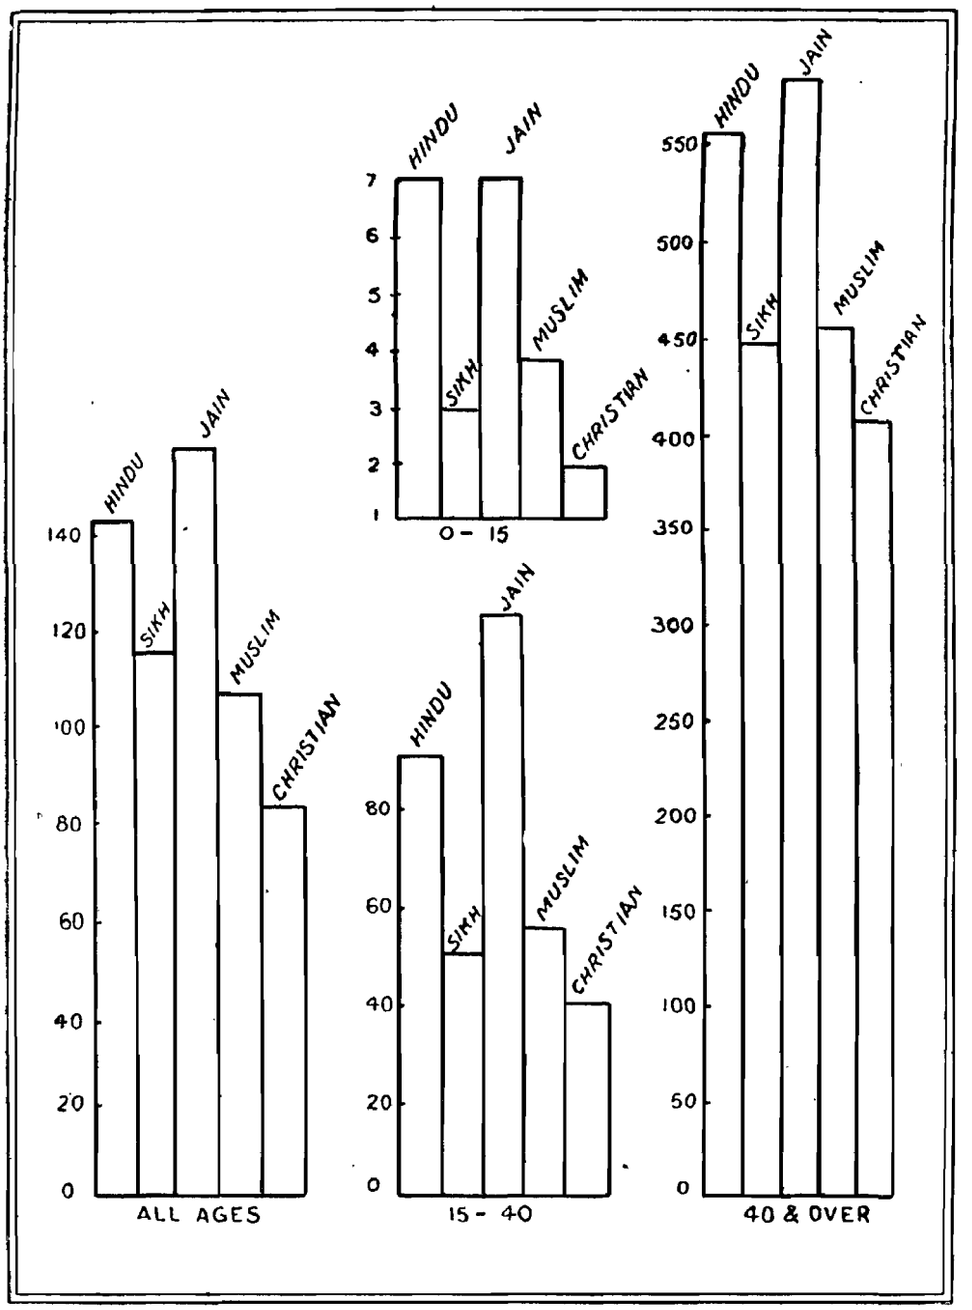

Distribution of 10,000 of total Population by Civil Condition and Age.

65 and over	169	124	9	1	81	24	79	99	259	345	23	47	155	113	81	185

There are hardly any widows below 20 in England and Wales, and their number even up to the age of 45 is almost insignificant. The particularly small number of widowers points to the facility, with which they can remarry. On the other hand the number of widowers in this Province is enormous. The fact that there is proportionately a higher number of married males in England and Wales at the ages of 35 and upwards shows that owing to longer life and late marriage the effective period of marriage in that country is much longer than here. The table also indicates in no uncertain terms the difference between the age of marriage in this Province and that in England and Wales.

Proportion of Widows Among Females of Main Religions.

120. The large number of widows presents a pathetic picture among the followers of all religions, though they are not quite uniform. The diagram given below shows the number of widows per 1,000 females in each age-period by main religions. The scales for different age-periods are different.

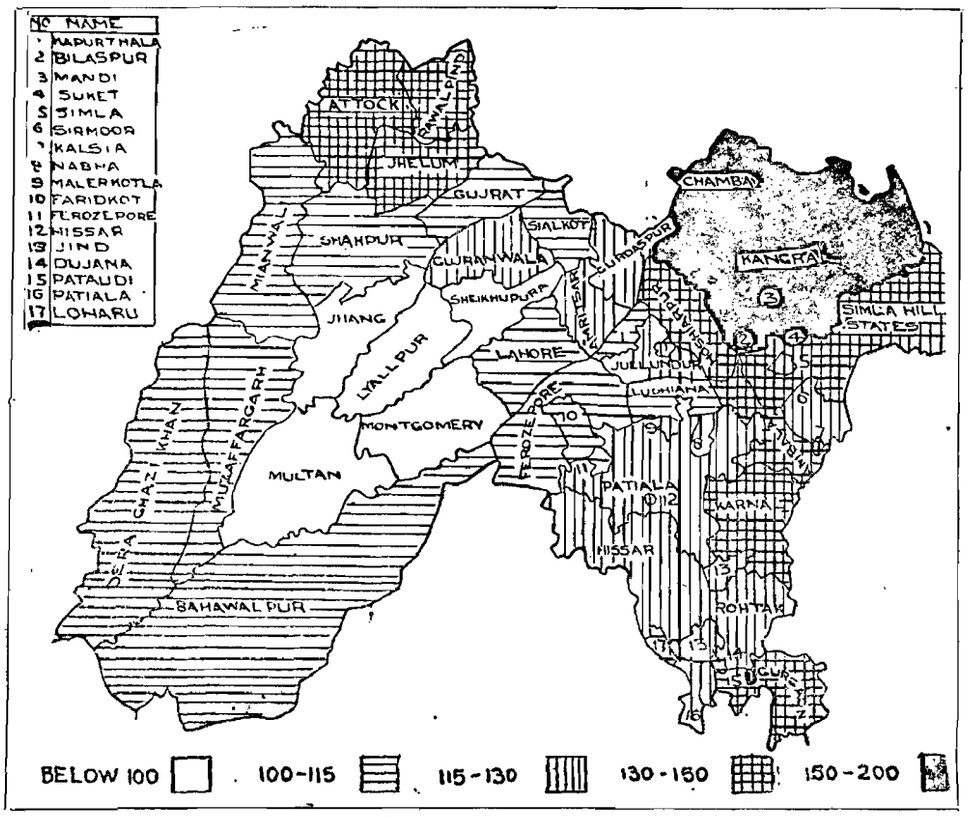

Number of Widows per 1,000 of female population of each age-period.

It will be seen that Jains have the highest proportion of widows at all ages, and Hindus the next highest. Muslims and Sikhs are nearly on the same footing, except that in the case of Sikhs the proportion for all ages is slightly higher, but lower in the child-bearing period of life and ages over 40. This is

accounted for by the smaller proportion of girls aged 0—15 among Sikhs as compared to Muslims. Consequently the rate of remarriage of widows among Sikhs would appear to be comparatively higher. The proportion of widows among Christians is the smallest.

Proportion of Widows in Different Areas.

121. The map below shows the local distribution of widows and their

Number of Widows per 1,000 of total females.

number *per mille* of total females in each district and state. The highest proportion of widows is found in Kangra District and Mandi, Suket and Bilaspur States. In the plains the small State of Pataudi heads the list. Hoshiarpur, Ambala and Gurgaon have also a fairly high proportion. In the north-west the proportion of widows in Jhelum, Rawalpindi and Attock with their Rajput and other martial races is not at all low, a fact which refutes the view commonly held of Muslim widows remarrying in large numbers. In this map all the colony districts (except Shahpur, which has a large *thal* area and the salt range similar in character to Jhelum and Attock, inhabited by Awans) stand out prominently as having the smallest proportion of widows. The reasons for this are not far to seek; the people of colony areas are comparatively prosperous and take into wedlock all women of marriageable age, whether widows or virgins. The heterogeneous character of the population makes it easy for the people to marry widows in the absence of prejudices peculiar to their home districts.

Proportion of Widows Among Different Castes.

122. The marginal table gives the number of widows *per mille* of total females of each of the main castes, which have been arranged alphabetically. The Brahman with 198 widows out of a thousand women, or nearly one-fifth, tops the list. The Hindu Rajput with high feudal and military traditions comes next, followed by the trading Aggarwal (172), a good third. Then come Khatri (151),

Caste.		Widows.
1		2
Aggarwal	(Hindu)	172
Do.	(Jain)	165
Arain	(Muslim)	95
Arora	(Hindu)	134
Do.	(Sikh)	111
Awan	(Muslim)	115
Biloch	(Muslim)	90
Brahman	(Hindu)	198
Jat	(Hindu)	125
Do.	(Sikh)	124
Do.	(Muslim)	98
Khatri	(Hindu)	151
Pathan	(Muslim)	116
Rajput	(Hindu)	181
Do.	(Sikh)	95
Do.	(Muslim)	118
Sayad	(Muslim)	131
Sheikh	(Muslim)	103
Christian	(Total)	81
Chuhra	(Hindu)	91
Do.	(Sikh)	99

Arora (134) and Jat (125). Among Muslims the high-born Sayad (131), the martial tribes of Pathan (116) and Awan (115), and the heterogeneous collection, known as Sheikh (103), have the highest proportion of widows; while the Jat and Biloch have the smallest population. Among Sikhs the Jat (124) is the aristocrat and the Arora (111) is a mere shop-man and has a smaller proportion of widows. As compared with the figures quoted above the number of widows among Christians (81) is very small indeed.

Widow Remarriage.

123. Among the followers of Islam and Christianity there is no religious tenet prohibiting widow remarriage. But social customs come into play, and among Muslims the castes and tribes enjoying high social status consider it derogatory for their widows to seek remarriage. For example Jats, Rajputs, Sayads and Pathans in many cases would not permit their widows to remarry. Evidently they have been influenced by their long association with the Hindus. The table in the margin shows the difference between the proportions of Hindu and Muslim widows in the female population of their respective religion in various age-periods. Thus a rough idea of the extent of remarriage among Muslim widows can be formed from these figures.

Proportion of widows per mille of all females at different age-periods.

Age-period.	Hindu.	Muslim.	Difference *per mille.*
1	2	3	4
0—5 ..	..	.	..
5—10 ..	2	1	1
10—15 ..	5	3	2
15—40 ..	92	57	35
40 and over ..	557	457	100

The number of widow remarriages among caste Hindus is still very small as is apparent from the figures for castes given in the last paragraph. Among some Hindu castes such as Jats widow remarriage is common, as indicated by the smaller proportion of widows among them (125 *per mille* of total females as against 198 among Brahmans). The actual figures of remarriage of caste widows given below are based on the information supplied by the Vidhva Vivah Sahaik Sabha, the main society in the Province which encourages widow remarriage. The figures comprise widow remarriages in the Punjab and the N. W. F. Province, and indicate an increase from year to year, but even so the number of remarriages up-to-date is negligible in view of the enormous number of widows of marriageable ages.

CHAPTER VII.

INFIRMITIES.

124. General. 125. Insane. 126. Local distribution of insanity. 127. Sex proportion and age distribution among the insane. 128. Punjab Mental Hospital. 129. The Deaf and Dumb. 130. Age distribution of deaf-mutes. 131. Local distribution of deaf-mutes. 132. The blind. 133. Age distribution of the blind. 134. Measures for combating blindness. 135. Leprosy and its local distribution. 136. Leprosy at different ages. 137. Proportion of sexes among the leprous. 138. Leper Asylums in the Province. 139. Age distribution among different infirmities and total population. 140. Comparison of the number of the infirm with other provinces. 141. Sex proportion by age among the infirm.

Reference to Statistics.

The statistics relating to the four infirmities, insanity, deaf-mutism, blindness and leprosy, by quinquennial age-periods for the Province are given in Imperial Table IX, Part I, and totals for all ages by each district and state are given in Part II of the same table.

Subsidiary Table I gives the number of the infirm per 100,000 of the total population of each sex for the whole Province, and each Natural Division, district and state.

Subsidiary Table II gives the number of the infirm per 100,000 and females per 1,000 males at certain age-periods for the whole Province.

Subsidiary Table III gives age distribution of 10,000 infirm for the total Province.

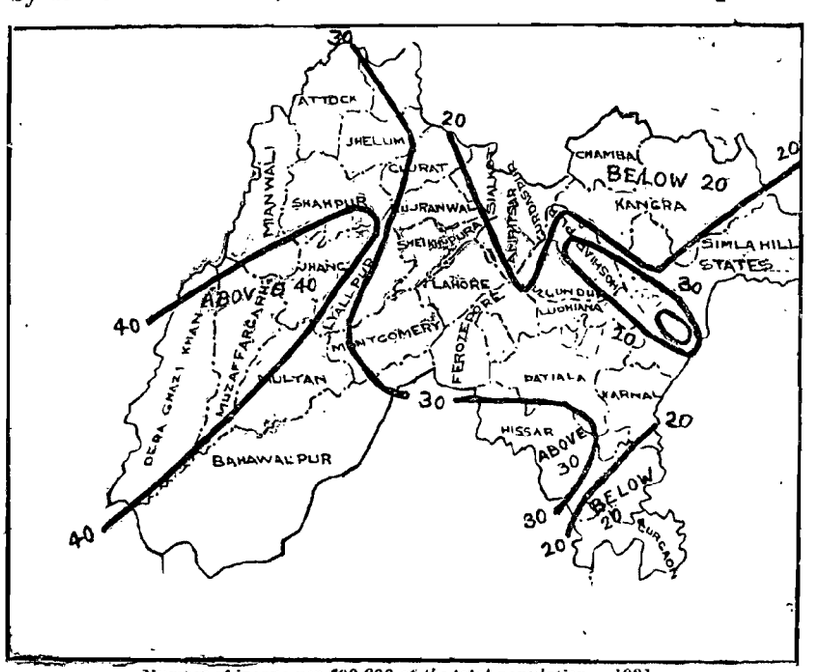

General.

124. An enquiry which deals with the various aspects of the population, for instance, with the number of earners, working dependants and non-working dependants, would be incomplete if it did not make an attempt to estimate what proportion of the population suffers from some physical infirmity rendering it incapable of earning a livelihood. In order to partially fulfil this purpose a column has been provided in the general schedule at each census to ascertain the number of persons, who are insane, deaf-mute, totally blind or leprous.

The figures obtained as a result of this enquiry are given in Imperial Table IX, Parts I and II. It may be remarked that the figures of infirmities are the least dependable of all the census figures as the presence of an infirmity, especially leprosy or insanity among females, is seldom given out. The only figures comparatively reliable are those concerning blindness, an infirmity to which no stigma attaches, but here again sometimes persons with a weak eyesight or blind of one eye are returned as totally blind.

Insane.

125. At this census 5,619 males and 2,720 females were recorded as insane in the Province. These figures include the congenital idiots, known in some places as "*chuhas*" (literally meaning rats) owing to the shape and smallness of their heads and features, and those who become mentally deranged later in life. The number of the insane appears to be very much smaller than it really is, as an infirmity of this type is kept carefully concealed, and strangers are unaware of its existence in a family unless it takes an acute form or the afflicted person becomes violent. The figures of past censuses were, however, affected by similar drawbacks, and the results are therefore comparable.

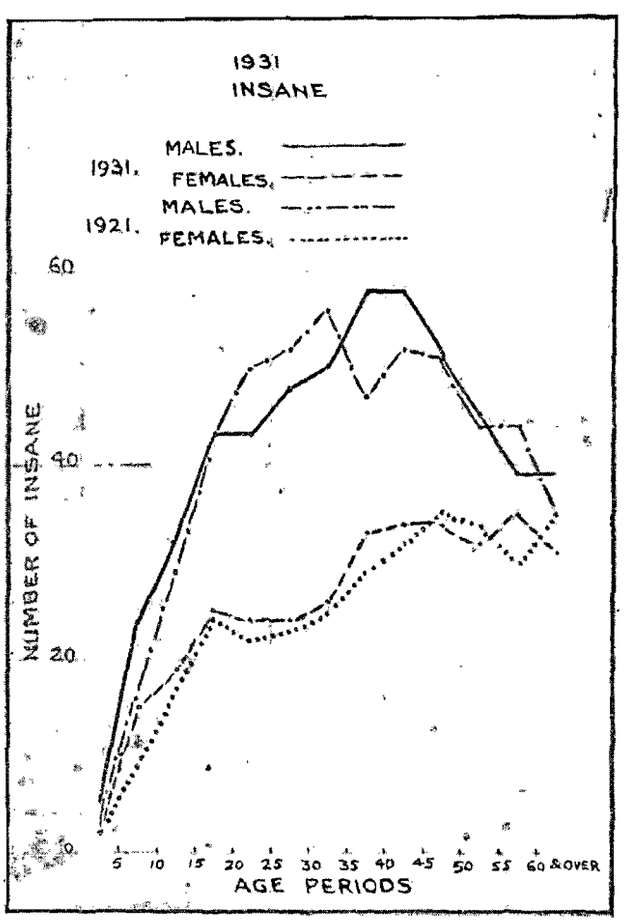

Number of insane per 100,000 of the total population. 1931.

Local Distribution of Insanity.

126. The map in the margin shows the local distribution of insanity in the Province, the number of the insane of both sexes per 100,000 of the total population of each area being illustrated. The figures of Lahore Dis-

trict have been taken after excluding the inmates of the Lahore Mental Hospital born outside the district. It is apparent from the map that the highest number of insane persons is to be found in the Districts of Jhang, Muzaffargarh and Dera Ghazi Khan. Poverty, drug habit and some peculiarity of their hot climate* may have their share, but the main cause seems to be the practice prevailing among the inhabitants to marry within a limited circle of relationship. Cousin marriages, if the process is repeated generation after generation, are in some cases directly responsible for imbecility and unsoundness of mind in children. The high proportion in some other predominantly Muslim districts also lends support to this view. The proportion obtaining to the east of the isopleth showing 30 per 100,000 for the central Punjab is small, except for an area of high proportion in Hoshiarpur District and the lower foot-hills of Kalsia. This area is also conspicuous for the smallest proportion of females, and there is possibly a connection between insanity and enforced sexual abstinence. That this is so is evidenced by the greater prevalence of insanity in youth and early manhood. This result may also be partly due to better enumeration in these areas and partly to poverty. The proportion in the other Sub-Himalayan districts and Kangra and Simla is the lowest, being less than 20 per 100,000 of the total population. Hissar has a proportion of over 30, while a little more to the south-east the figures show an improvement.

Sex Proportion and Age Distribution Among the Insane.

Number of insane per 100,000 of total population of each sex for each age-period.

127. The graph in the margin shows the distribution of the insane by sex and age, the number per 100,000 of each sex at various ages being given for 1931 and 1921.

Like all other infirmities the number returned as insane is very small below the age of five, but by the age of ten the imbecility of the children would be well established. The proportion then begins to rise steadily till the ages of 35—45 when it is about highest among males. Afterwards it begins to fall rapidly among males, while among females its decline is rather slow and the highest point is reached at 55—60. The proportions for the 1921 census are about the same, and the nature of the two curves is similar except for minor variations due to the new process of smoothing the ages. The only difference at the

*During the summer months the people of these localities annoint their bodies with oil as a protection against the evil effects of excessive heat.

present census is that the peaks of the curves have been slightly displaced. The general tendency of the smaller proportion of the insane at young ages, the largest proportion obtaining in middle ages, and a rapid decline in old ages, is the same in both sets of curves. The comparative difference between the male and female proportions also remains the same, and it is significant that among females the proportion of the insane is always lower than males, no doubt due partly to the concealment of the infirmity. Among women too, an increase in the proportion is apparent till the age of 20, but between 20 and 30 the proportion drops slightly, indicating thereby that at this period of a woman's life she is well treated. This particular drop in the proportion may be partly due to the increase in the number of able-bodied women at this age as a result of immigration. The female proportion again begins to rise from 30 onwards and after remaining almost steady till 55 reaches the highest point at 55—60, dropping again for all ages over 60. This should cause no surprise as the ages of the insane have to be guessed by others, and as we know most persons are erratic even in stating their own age. The higher proportion at comparatively older ages might be due partly to ill-treatment, to which old women are sometimes subjected.

The drop in the proportion of the insane of both sexes at higher ages is accountable by the fact that insanity is a derangement found in the most youthful, and the insane are for various reasons much shorter-lived than normal people.

Punjab Mental Hospital

128. There is only one Mental Hospital in the Province, which is situated in Lahore. In the margin is reproduced the average daily number of inmates of this hospital for each of the ten years, 1922—31. The figures show that on an average about 1,000 persons mentally unfit are looked after in this hospital. Until recently accommodation had been much restricted, but the addition of a new section for criminals and another for women has relieved the congestion. Some improvements in sanitation to ameliorate the health conditions have also been carried out. Consequently the health statistics have steadily improved despite the increase in the number of patients, but even then mortality amounted to 10·39 per cent. of the average daily population during the year 1929-30.

Year.	Total.	Males.	Females.
1922 ..	867	683	184
1923 ..	900	710	190
1924 ..	875	683	192
1925 ..	865	681	184
1926 ..	854	671	183
1927 ..	890	705	185
1928 ..	950	754	196
1929 ..	1,011	802	209
1930 ..	1,010	802	208
1931 ..	993	772	221

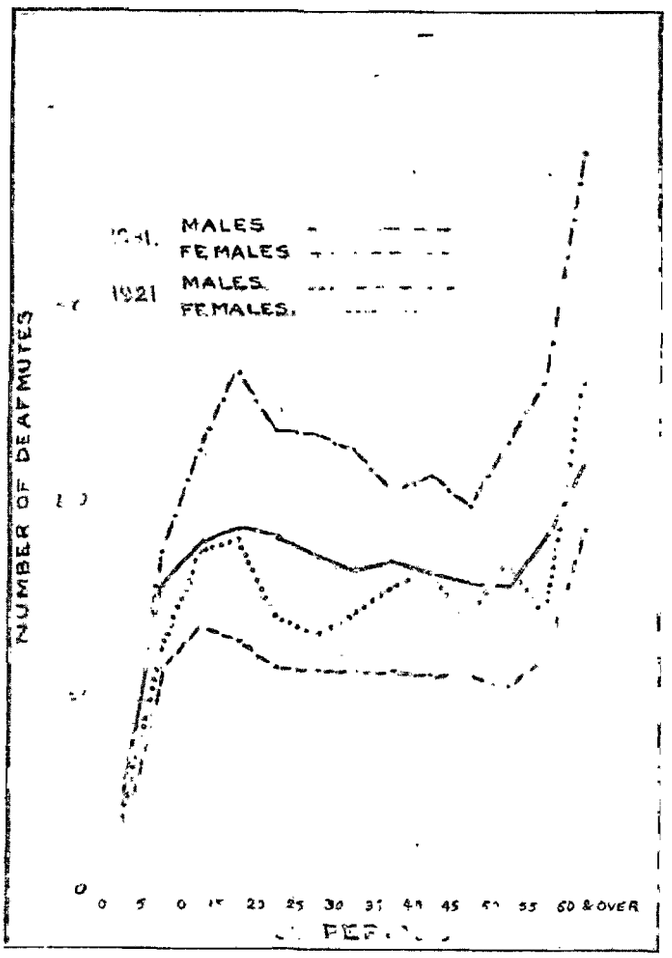

The treatment of the insane has now been brought into line, as far as possible, with modern methods. Formerly all patients were removed to their cells or barracks for two or three hours during the hotter part of the day when their attendants were off duty, while violent cases were hardly allowed full liberty even within the precincts of their section and suicidal patients were kept locked in their cells at night. A distinct improvement has been noticeable during the last decade. All cases of acute melancholia and all patients exhibiting definite suicidal tendency are kept in an open hospital ward, with trained attendants on duty day and night. While these measures cannot absolutely prevent suicides it is a fact that they have a salutary effect on the situation.

The Deaf and Dumb.

129. The deaf and dumb in the Province number 12,347 males and 7,185 females, as compared to 14,613 males and 8,145 females ten years ago. There is thus a decrease in both sexes. It was remarked in the last Census Report that some persons, who were weak of hearing only, had probably been included in the returns, especially at higher ages. The intention was to

ascertain the number of the persons, who were both deaf and dumb, and the instructions to enumerators were made very clear on this point both in 1921 and now. The instructions appear to have been carried out more faithfully on the present occasion.

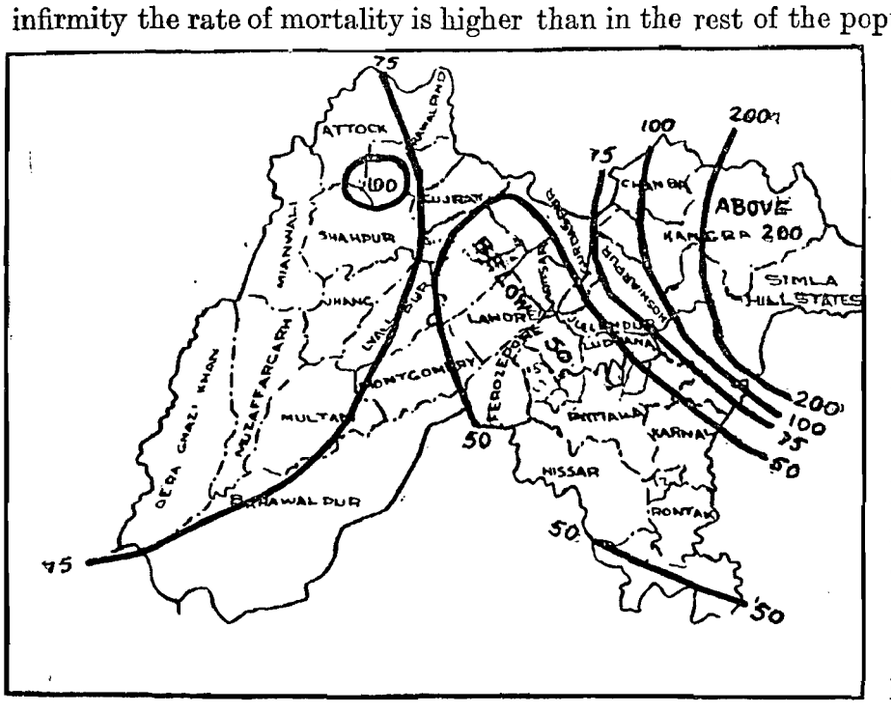

Age Distribution of Deaf-mutes.

Number of deaf-mutes per 100 000 of total population of each sex for each age-period.

130. The graph in the margin shows the age distribution of the deaf and dumb at this census and at the census of 1921. The proportion for both sexes has considerably fallen at all ages though it seems that the figures of ages after 55 have still been swollen by the inclusion of those who have lost their hearing or power of speech owing to extreme old age or a disease such as paralysis. In the earlier ages, of course, the figures are for the most part made up of those born deaf and dumb. The proportion as in the case of other infirmities rises up to the ages of 10—15 years, but thereafter drops gradually till the age of 55 and again rises abruptly. The drop in the proportion till the age of 55 shows that among those afflicted with this infirmity the rate of mortality is higher than in the rest of the population.

Local Distribution of Deaf-mutes.

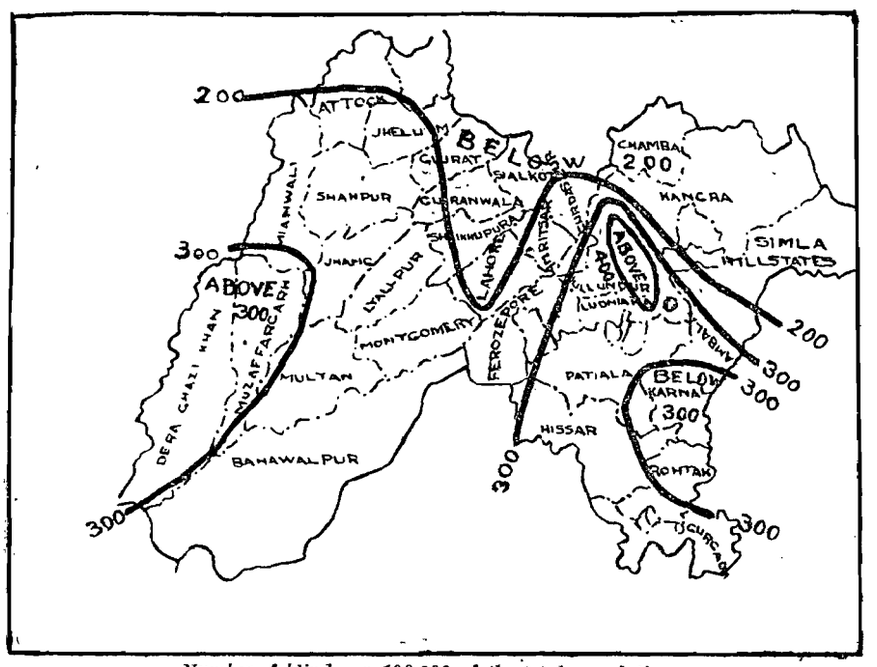

Number of deaf-mutes per 100,000 of the total population, 1931.

131. The map in the margin shows the local distribution of deaf-mutes. The highest proportion is met with in the Himalayas, the number evidently rising with the altitude. The prevalence of goitre in the

Himalayan areas has undoubtedly something to do with this infirmity, as also congenital syphilis. The Indo-Gangetic Plain containing the greatest proportion of Hindu and Sikh population with the wider degree of exogamy has the lowest proportion. The proportion in the western and predominantly Muslim districts is higher, the salt range area in Jhelum District showing a proportion of over 100 per 100,000. The high proportion in western districts might therefore have a good deal to do with the practice of cousin-marriage common among Muslims.

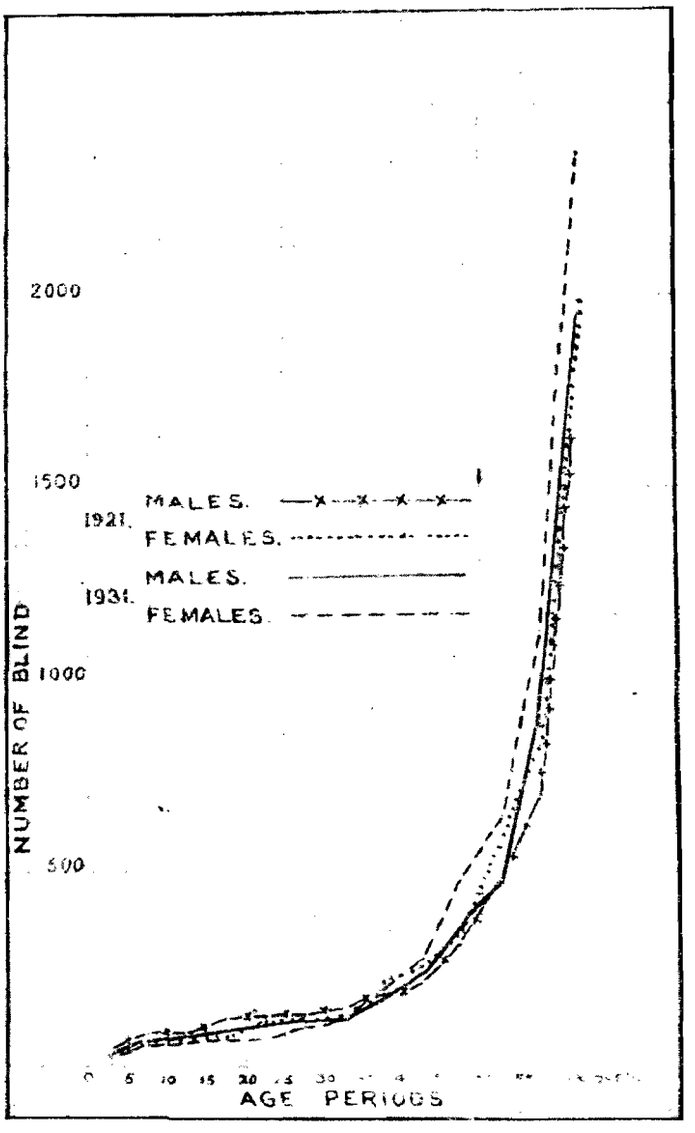

132. According to the returns there were 69,673 persons totally blind in the Province as against 65,051 ten years ago. The increase is mainly due to the increase in the total population. The number of blind females per 1,000 blind males is 876. **The Blind.**

Number of blind per 100,000 of the total population.

The map in the margin shows the local distribution of the blind. The proportion of the blind per 100,000 of the total population of each area is given. It would appear that the greatest proportion of the blind is to be found in the Hoshiarpur District, mainly resulting from small-pox which according to the statistics available caused proportionately more deaths there during the last decade than in any other district. Moreover, this district has got a particularly large proportion of the aged as is evident from the map on page 133, and old people as is well known are much more liable to lose their vision than others. The Himalayan districts and states have the smallest proportion, as also Rawalpindi and the northern part of Attock District, evidently because of the cooler climate and comparative absence of dust. The districts of eastern Punjab between the Sutlej and the Ghaggar have a higher proportion of blindness than those to the west. The proportion in the south-west of the Province is again high, evidently due to the sand and dust and the strong glare of the sun.

Age Distribution of the Blind.

Number of blind per 100,000 of total population of each sex for each age-period.

133. The diagram in the margin shows the proportion of the blind per 100,000 of each sex at various ages for this census as well as the last. The number of those born blind seems to be very small, and the fewness of blind children below 5 is mainly due to the refusal of fond parents to admit total blindness of their offspring while there is any hope of a cure. The proportion up to ages of 30 rises slowly but steadily, and afterwards begins to mount rapidly, the curve becoming very steep after 55 when senility is undoubtedly the cause.

The conditions for both sexes are similar with this difference that the curve for females keeps lower than that of males up to the age of 35 when it crosses over, indicating a smaller proportion of the blind among females of younger ages, which is attributable partly to greater concealment in the case of females, and partly to the genuinely larger number of the blind among males, who are in the majority in the total population, and are comparatively more exposed to accidents. The curve for females after crossing the curve for males at 35—40 keeps a higher level to the end.

Measures for Combating Blindness.

134. It will be evident from the diagram in the last paragraph that the proportion of the blind to the total population of both sexes has slightly risen since 1921, and considering that better means are now available to combat blindness, the increase may be attributable to the improvement in enumeration at the present census.

Year.	Number of successful operations.	Year.	Number of successful operations.	Year.	Number of successful operations.
1	2	1	2	1	2
1901	5,204	1911	9,252	1921	11,477
1902	4,683	1912	12,065	1922	13,022
1903	4,841	1913	12,173	1923	13,127

1910	8.763	1920	13,605	1930	20,258

The table in the margin shows the successful operations of cataract performed in the Province annually since 1901. These figures have been supplied by the Inspector-General of Civil Hospitals, and show the progress made from year to year. But for these operations the number of the blind would be many times greater than it is. The available

*Not available.

figures for the three well-known centres, Moga, Amritsar and Gojra, are given in the margin for general interest.

Leprosy and its Local Distribution.

135. The figures of leprosy are the least reliable, as it is a disease which the afflicted are anxious to conceal and in many cases can conceal successfully. The instructions required the enumerators to distinguish between leucoderma and leprosy, and only to record the latter. In a large number of cases an enumerator is not competent enough to make out the disease by merely looking at the sufferer, and in the case of females he has, as a rule, to depend on the version of a male member of the family. It might therefore be pertinently asked why if the statistics of leprosy are so incomplete these are at all compiled at each census. The answer to this question has already been given, and it may be added that with a better understanding of the object of a census, which is noticeable, an increasing measure of accuracy is being attained; moreover, the figures at any rate give the comparative local distribution of the infirmity, and those who are trying to eradicate it from the land are greatly assisted if they know in what localities their attention is most needed. If it be admitted that the tendency to conceal this infirmity is uniformly strong in all parts of the Province, the high proportion of lepers in a particular area will show that the number of sufferers there is comparatively larger than elsewhere. At the same time it would become possible to locate the special cause of the disease in the particular locality.

Proportion of lepers per 100,000 of the population.

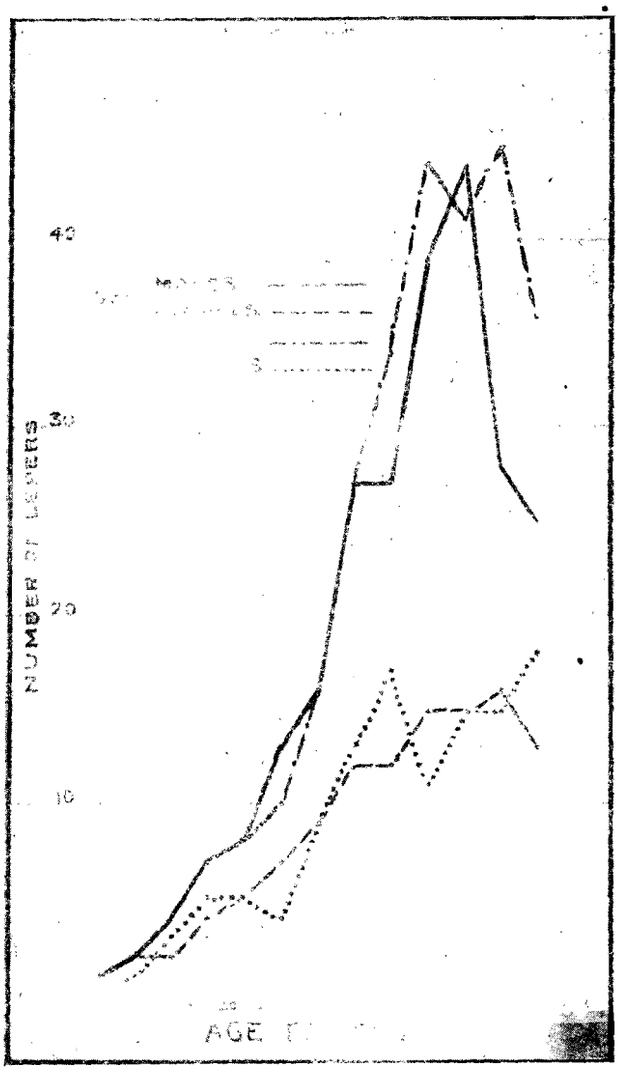

The map in the margin shows the local distribution of lepers, the number per 100,000 of total population of each area being shown. The number of foreign-born inmates of leper asylums has been excluded in each case.

The proportion of the leprous is largest in the Himalayan Natural Division, the figures of Kangra (39) and Mandi (144) being the highest. The affliction in the hill areas arises for the most part from the prevalence of venereal diseases. The Ludhiana, Jullundur and Rawalpindi Districts and Bahawalpur State have the next highest proportion. Most of the central districts as well as the

districts in the extreme north-west and the south-east across the Ghaggar show the smallest proportion.

Leprosy at Different Ages.

136. Let us now examine the number of lepers at different ages as compared to the total population at those ages. This proportion for the present census as well as the last is illustrated by the graph in the margin. We find that lepers form about the same proportion of the present population as they did ten years ago of the 1921 population. The proportion among both the sexes is also practically the same, the 1931 curves being generally smoother. We notice that the maximum proportion of lepers is in the population aged between 40 and 55 years. It may, therefore, be regarded as an infirmity of the middle aged, the small proportion of lepers among persons of over 50 indicating that lepers do not survive the age of 50 in considerable numbers.

Number of Lepers per 100,000 of total population of each sex for each age-period.

Proportion of Sexes among the Leprous

137. It will have been noticed from the diagram above that proportionately fewer females are afflicted with leprosy than males. This disparity is partly due togreater concealment of the infirmity among females. It is quite possible that despite clear instructions an enumerator as a result of his own ignorance of the disease may put down as leprous a person merely suffering from leucoderma, yaws or syphilis. This possibility will affect the male figures in particular and raise the proportion of male lepers higher.

In recent years a campaign has been launched to eradicate leprosy from the Province and a note on the subject, written specially by the Director of Public Health, is printed as Appendix II at the end of this Report and briefly describes the details of these activities.

Leper Asylums in the Province.

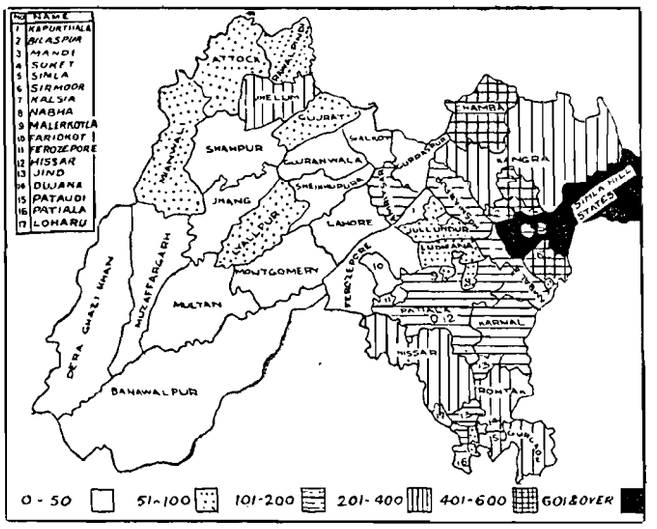

Leper Asylum.	1931.	1921.
1	2	3
Palampur (Kangra District).	30	66
Subathu (Simla District).	88	173
Tarn Taran (Amritsar District)	120	224
Ambala	108	89
Rawalpindi	52	185

138. In the margin is shown the number of patients in residence in the different asylums of the Province in 1931 and 1921. Admission to these asylums is voluntary, and lepers are maintained and treated by specialists in the disease according to up-to-date methods and free of any charge. Any leper applying for admission is admitted if accommodation

bulk of working dependants is engaged in Cultivation (81·6 per cent.) and the majority of the rest in Industry (9 per cent.) and Stock-raising (3·6 per cent). In other occupations such as trade and domestic service there are very few working dependants, and practically none in transport and Public Administration. The ratio of females to males among working dependants is as high as 923 *per mille*, while among earners it is no more than 67 *per mille*.

It is sometimes not at all easy to draw a line between working dependants and earners. For instance, the proportion of working dependants in the total population of Jammu and Kashmir (see table in paragraph 148) is greater than the proportion of earners themselves. This difficulty is partly due to the habit in this country on the part of joint families to return only the head of the family as the earner. Even the grown-up sons of a family, employed in various occupations, in numerous cases hand over their earnings to the head of the family, receiving occasionally sums of money to meet their own expenses. This applies with particular force to the children of cultivators in cases in which the father owns the land and the sons merely cultivate the fields as working dependants. Though every endeavour was made, as is apparent from the extracts given in the first paragraph of this Chapter, to obtain uniformity in the return of occupations, the results of certain areas are slightly affected by the differences in the interpretation of the instructions on the subject. Separate entries for working dependants are however not valueless as they show, within reasonable limits, the extent of the share taken in bread-winning by the women and children in different areas. A clearer view of this will, however, be obtained if we confine ourselves to a study of the local distribution of women workers.

147. The bulk of the female population of this Province is undoubtedly constantly engaged in numerous kinds of work, which comprise among other duties cleaning and plastering the house, bringing up children, cooking, milking of cows and buffaloes, spinning, sewing and mending of clothes, agricultural labour, embroidery of clothes and shoes, etc. All these activities, though of the utmost importance, would be regarded at the census as no work at all, and the women engaged in them would be treated as 'non-working dependants.' The rule that the producers of economic utility alone should be treated as workers is, however, very difficult to interpret and apply. A reference to this was made in the following quotation reproduced from the India Census Report of 1921 (page 236, paragraph 202). "The distribution between worker and dependant and between primary and subsidiary occupation involves subtleties of interpretation which continually gave trouble in individual cases, and the extent to which the occupations of women and children actually contribute to the income of the family must always be a matter of opinion and give rise to inconsistencies in the return. The work of classification is further hampered by the different attitude in different areas of the people and enumerator towards the 'dignity of labour.'" Further it is not at all easy to choose the principal occupation of working dependants who are often engaged in various kinds of work at different periods of the year. On the whole even if the matter of classification is regarded as giving too small or too high a proportion of female workers the results obtained are of some value as an indication of the relative share in economic work now taken by women, as

Number of female workers per 1,000 of total females.

compared with the past, or in different parts of the Province and in different occupations. We shall deal first with the second of the three possible avenues of enquiry. The marginal map shows the number of female workers *per mille* of total females in each district or state. It can be safely said that proportionately a larger number of women are engaged in economic work in the Himalayan Natural Division than in the plains, and that in the latter the women of south-eastern districts, such as Hissar, Rohtak and Gurgaon, take a greater share in such work than the women of the central districts with one or two exceptions and the districts and states of the south-west. In the Himalayas as well as in the south-east of the Province women take a large share in agricultural work, and in some localities are believed to do it even better than their husbands. Women of the north-western districts are also fairly active workers.

Subsidiary Table III at the end of this Chapter gives the proportion of female workers engaged in important occupations per 1,000 males similarly engaged. In the margin are given the absolute figures as well as proportions for certain groups, in which there are more than 500 female workers per 1,000 males. There are thus actually more female workers in the three groups, (71) flour grinder, etc., (72) grain parchers, etc., and (172) mid-wives, etc. In the work of scavenging too females have a large share, partly because in numerous households they are employed in preference to men, and partly because a male sweeper very often takes up odd jobs, particularly agricultural.

Group No.	Occupation.	Absolute figures of female workers.	Number of females per 1,000 male workers.
1	2	3	4
15.	Tea	493	504
19.	Collectors of forest products	1,121	830
46.	Wool carding, spinning and weaving ..	1,051	506
50.	Lace, crepe, embroideries, fringes, etc., and insufficiently described textile industries ..	485	734
71.	Rice pounders and huskers and flour-grinders	12,754	1,455
72.	Grain-parchers, etc.	8,106	1,145
81.	Others	6,687	566
	Order 17, Miscellaneous and unclassified industries	111,704	559
100.	Scavenging	110,219	826
172.	Midwives, vaccinators, compounders, nurses, masseurs	7,958	1,856
194.	Procurers and prostitutes	1,142	5,031

Subsidiary Occupations.

148. As noted in the first paragraph of this Chapter the instructions required the enumerators to record in column 11 the subsidiary occupation of earners. If an earner had several subsidiary occupations only the most lucrative was to be entered. This choice having perforce been left to the person enumerated would to some extent affect the returns of principal occupations, as for instance a police constable may return his principal occupation as rent-receiver and his subsidiary occupation as policeman. Thus the total number of persons engaged in police service can only be obtained by adding the figures of those

who have returned police service as their principal as well as of those who have returned it as their subsidiary occupation. As a matter of fact, Public Administration has been recorded as a subsidiary occupation of very few persons, which indicates that either the salary of a public servant is his principal means of livelihood or he considers it more dignified to return public service as his principal occupation. In some cases though he is deriving a larger income from trade, a public servant will take care not to return it as an occupation, being debarred from trading by the rules of his service. The chief occupations followed by earners as subsidiary to some others are cultivation, industry or trade. Subsidiary Table I at the end of this Chapter shows the number of earners having some subsidiary occupation per 10,000 of the total population. An extract from this table in respect of the important occupations is given in the margin, similar proportion for earners with principal occupations being added. These figures imply that if the whole population of the Province were assumed as 10,000 persons, 289 of them would be earners with some subsidiary occupation, 171, 45 and 20 being earners with agriculture, industry and trade as their subsidiary occupations, respectively. Compared to these there would in all be 2,989 persons who are earners with one occupation, or in another way out of every 10,000 earners only 968 have some subsidiary occupation. The ratio of females to 1,000 males among earners with some subsidiary occupation is 46 as compared to 67 among total earners.

Per 10,000 of the total population.

Occupation.	Earners principal occupation.	Earners subsidiary occupation.
All occupations ..	2,989	289
Cultivation ..	1,673	171
Industry ..	566	45
Trade ..	204	20

In the detailed examination of occupations which we shall undertake in section 2, only workers who have returned each occupation as their principal means of livelihood will be referred to, or be designated along with the working dependants as workers, except in certain important cases, in which the number of persons following it as a subsidiary occupation will be particularly mentioned.

Comparison of the Population of Workers with other Provinces.

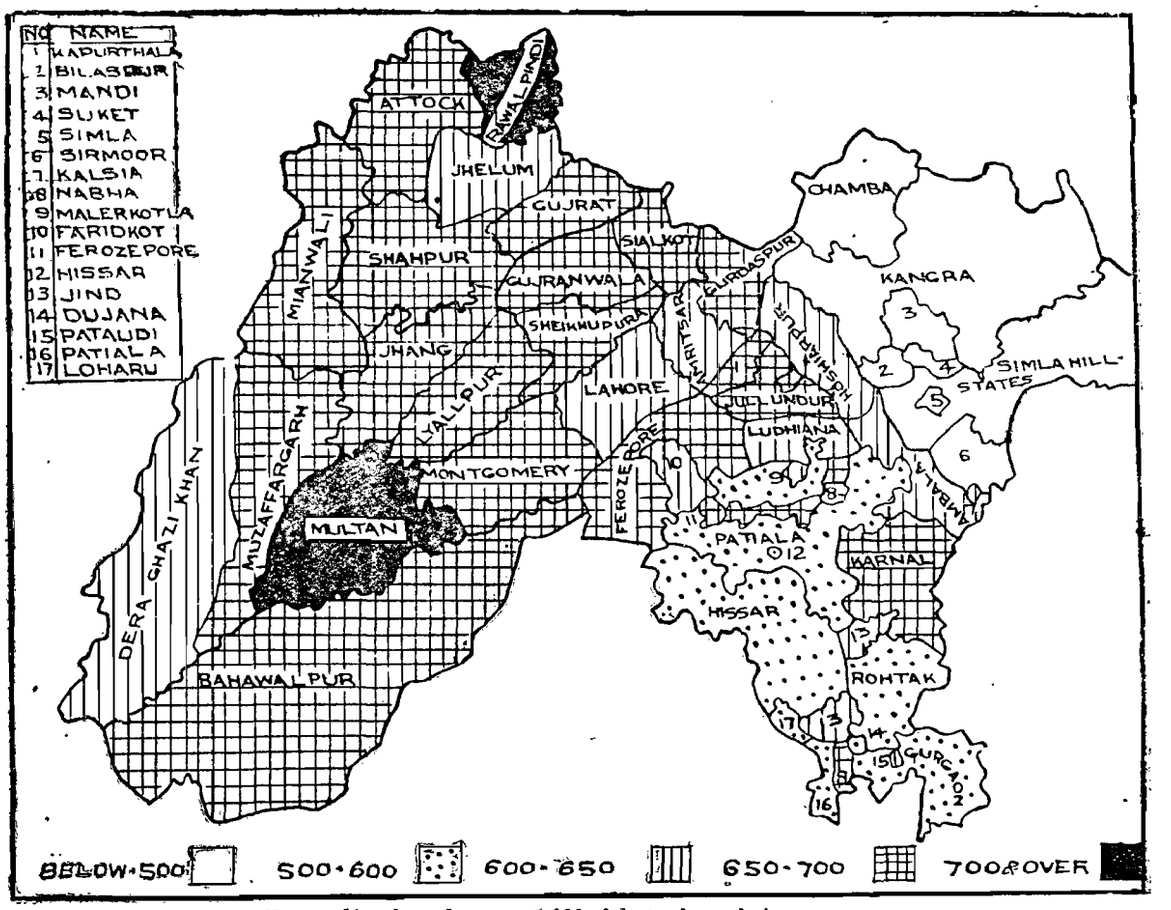

Number per 1,000 of total Population.		Punjab.	N.-W. F. P.	Delhi.	United Provinces.	Jammu and Kashmir State.	Burma.	Bengal.

149. Before we take up further examination of the figures of earners with principal occupations and working dependants it will be of interest to know the proportion of these in the total population of the Province and to compare it with similar proportions in other provinces. Such comparison is afforded by the figures in the marginal table. It will be noticed that except in the case of Bengal and N. W. F. P. the proportionate number of workers is smallest in this Province. If we turn to earners alone we find that their proportion in the North-West Frontier Province is larger than in this Province, but is very much smaller in Bengal, while Kashmir State with a large proportion of workers has a smaller proportion of earners. We have already referred to the case of female workers, and it may be remarked here that the number of these is insignificant in this Province as compared to certain other provinces such as the United Provinces and Burma or Kashmir

State. The only provinces where there is a still smaller proportion of female workers are the N.-W. F. P. and Bengal. Though the difference in these proportions might partly be due to different interpretations of instructions, yet it cannot be denied that they indicate in some measure the main characteristics of the people of the provinces, a su bject to which we shall revert after examining the conditions in the different parts of our own Province.

Distribution of Non-working Dependants.

150. In order to ascertain the comparative industry of the various localities, we may examine the proportion of non-working dependants in the total population of each district or state of the Province. The map below shows the non-working dependants *per mille* of the total population in each district and state. The Himalayan tracts appear to have the smallest number of non-working dependants, *i.e.* below 400 *per mille* of total population, and consequently a larger proportion of workers [see also Subsidiary Table II (*a*)].

Non-working dependants per 1,000 of the total population.

The proportion of non-working dependants is again comparatively small in the eastern districts, such as Hissar, Gurgaon and Rohtak, while Lahore, Amritsar, Hoshiarpur, Ambala, Ludhiana, Faridkot and Maler Kotla as well as Jhelum and Dera Ghazi Khan have less than 650 non-working dependants *per mille* of the total population. The proportion in Karnal and Ferozepore and Jullundur is higher than 650. In Karnal this may partly be due to the bad climate of the district, and in Ferozepore and Jullundur to a comparatively larger population under 15 years of age and to migration of able-bodied persons to the colonies. The proportion in the central Punjab districts, mentioned above, would be still lower but for the large amount of emigration from them. The proportion of non-working dependants is higher than 650 *per mille* in the rest of the districts to the west of the Ravi. These districts are predominantly Muslim, and their female population, particularly the women of well-to-do families, are secluded and do no out-door work. After this it should

not be difficult to connect the causes of the small number of workers in this Province and N. W. F. Province and Bengal, the provinces with a Muslim majority.

SECTION 2—DETAILED EXAMINATION OF OCCUPATIONS.

Detailed Examination of Occupational Distribution.

151. We can now take up some of the most important occupations individually. In a survey such as this it is only possible to touch the most important items, and what follows is intended as an explanation of the census statistics rather than any comprehensive attempt to discuss the changes or to ascertain their causes, much less to suggest remedies.

Cultivation.

152. In the premier industry of the Province, namely, cultivation, are employed 5,340,486 males and 1,040,228 females; of these 4,537,644 males and 229,878 females are recorded as earners, and 802,842 males and 810,350 females as working dependants, while 466,995 males and 19,486 females follow this industry as subsidiary to some other occupation.

The groups included in the category are 1—8, namely :—

(A) CULTIVATION.

1. Non-cultivating proprietors taking rent in money or kind.
2. Estate agents and managers of owners.
3. Estate agents and managers of Government.
4. Rent collectors, clerks, etc.
5. Cultivating owners.
6. Tenant cultivators.
7. Agricultural labourers.
8. Cultivators of *Jhum, taungya* and shifting areas.

No one in this Province has been returned in group No. 8 while the entries of groups 2, 3 and 4 are relatively very small.

The following extract from Subsidiary Table IV at the end of this Chapter gives the actual figures of workers engaged in each of these groups, and compares them with the figures of 1921. Groups 2 and 4 and 5 and 6 have been amalgamated in order to facilitate comparison. Cultivation has shown a very big increase.

Group No.	PRINCIPAL OCCUPATION.	Total actual 1931.	Number of workers in 1921.	Percentage variation 1921—31.
1	2	3	4	5
	A.—CULTIVATION ..	6,380,714	5,074,554	+25·7
1	Non-cultivating proprietors taking rent in money or kind ..	320,673	337,779	−5·1
2, 4	Estate agents and manager of owners, rent collectors, clerks, etc. ..	3,546	7,342	−51·7
5, 6	Cultivating owners and tenants cultivators	5,320,303	4,265,527	+24·7
7	Agricultural Labourers ..	736,028	463,906	+58·7

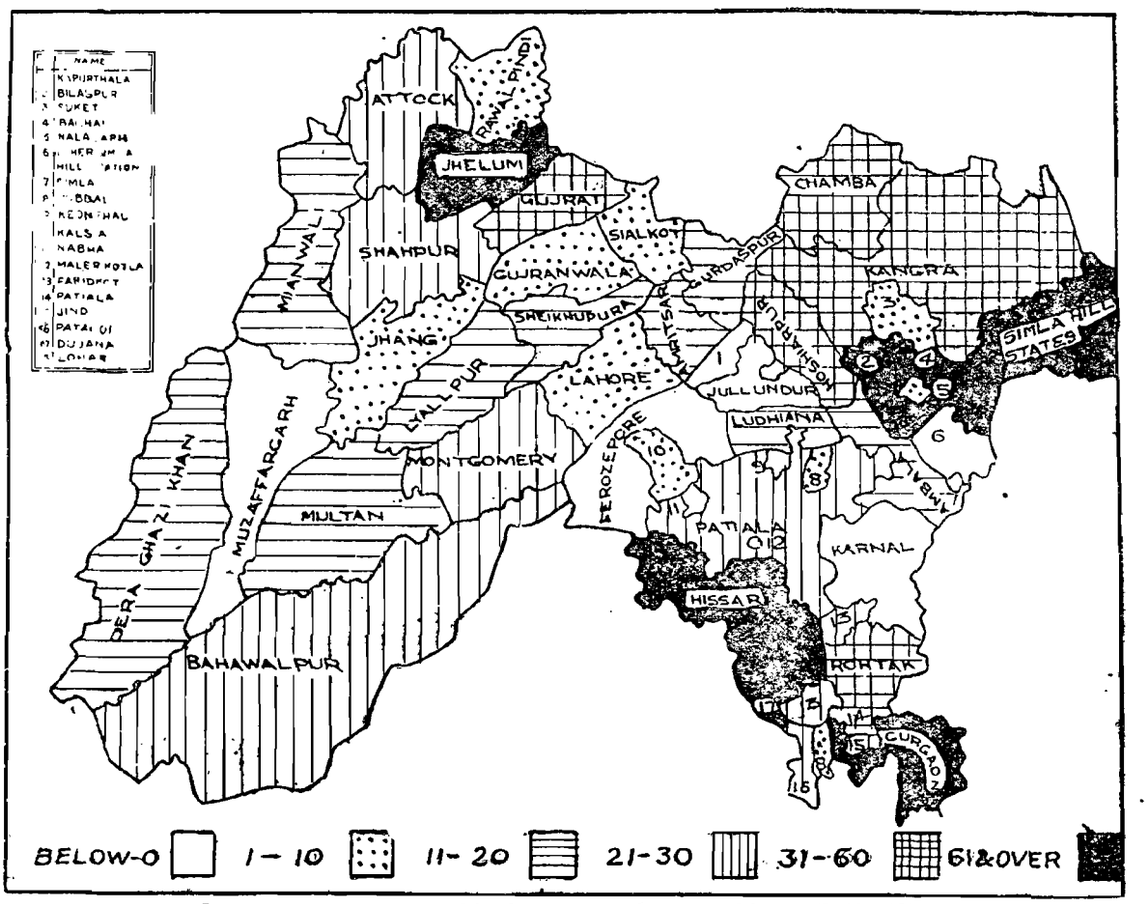

Rent-receivers.

It will be seen that there is a decrease of 5·1 per cent. among non-cultivating proprietors who receive rent in money or kind. In the first instance one might be disposed to urge that rent-receivers are not workers and their figures should be excluded from cultivators altogether and included in class D, meant for those who live on their income. But rent-receiving is directly associated with agriculture, and a landlord as well as a tenant can be a rent-receiver if he leases out his land to another man. As a matter of fact a great majority of rent-receivers are also cultivators of some portion of their land, though they prefer to return the more dignified occupation of rent-receiving as their principal or only occupation.

There are almost half as many more persons returning rent-receiving as their subsidiary occupation (143.616) and no doubt there should be some more in this group who are now included in group 185 as "Jagirdrs," many of whom are in reality either rent-receivers or actual cultivators.

Cultivating Owners and Tenants.

153. There has been a very big increase in the already numerous category of cultivators. The subject is of vital importance to the Province, and the map below shows the percentage increase in the number of cultivators including tenants since 1921 in each district and state.

Increase per cent. among cultivating owners and tenant cultivators (1921—31).

The increase is biggest in Simla and adjacent hill states and the districts of Gurgaon, Hissar and Jhelum. It is fairly big in Rohtak, Kangra, Hoshiarpur and Gujrat. In all these districts the demobilization of men serving in the Army may partly account for the increase, while in Gujrat the expansion of cultivation is the main cause. The increase is between 20 and 30 per cent. in Patiala, Montgomery, Bahawalpur, Shahpur and Attock, due to the first cause, especially in Patiala, Shahpur and Attock and to the large increase in cultivation in Montgomery and Bahawalpur. The increase in Dera Ghazi Khan, Mianwali, Sheikhupura, Amritsar, Gurdaspur, Ludhiana and Ambala is between 11 and 20 per cent. or about the same as the general rise in population during the last decade. An increase of 10 per cent. or less is only found in Rawalpindi, Sialkot, Gujranwala, Jhang, Lahore, Faridkot, Nabha and Mandi; while Jullundur, Karnal, Ferozepore, Muzaffargarh, Kapurthala and Sirmoor show a decrease. The conclusion to be drawn is that in these last-named areas the limit has been reached, beyond which the land is unable to yield a return to the labour of cultivators. The main reason for the total increase, no doubt, is that in this

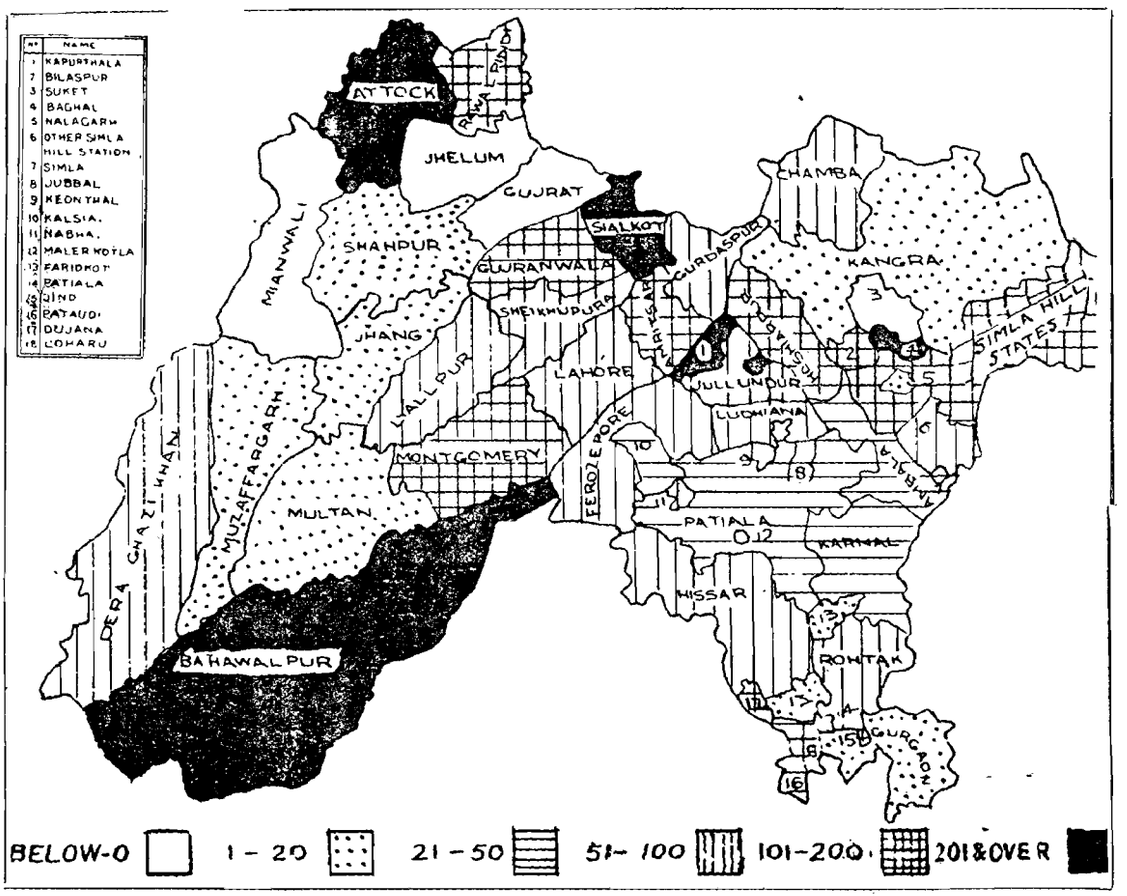

country agriculture is the mainstay of the people. The other resources of the Province are obviously not keeping pace with the rate of increase in the population. Agriculture when pressed beyond a certain limit is said by economists to give diminishing returns for the capital and labour expended on it. The increasing pressure on land, unaccompanied by any great advance in the methods of agriculture or introduction of improved implements resulting in increased output, must re-act on the economic condition of cultivators.

Agricultural Labourers.

154. The increase among agricultural labourers is the next noticeable figure. The number of these in British Territory is 591,960 males and 63,485 females inclusive of subsidiary workers, and 539,018 males and 58,944 females exclusive of these. The number for the whole Province exclusive of subsidiary workers is given in the table in paragraph 152, which shows an intercensal increase of 58·7 per cent. The variation in the number of agricultural labourers has to be examined along with the number returned as unspecified labourers, because the figures of the two are apt to get mixed up. These figures for the two censuses are given in the margin, and indicate an enormous increase in the number of agricultural labourers.

Occupation.	1931.	1921.	Variation, increase (+) or decrease (—).
Agricultural labourers	736,028	463,906	+58·7
Labourers unspecified	219,737	220,572	—·4

The map below shows the percentage increase among agricultural labourers in each district and state.

Percentage increase among agricultural labourers (earners with principal occupation and working dependants of 1931 as compared to actual workers of 1921).

There is an increase of over 200 per cent. in Bahawalpur State, Attock, Sialkot, Kapurthala and Suket. The actual number of field-labourers in other areas except Sialkot was never very large, so the percentage increase is not a

true criterion of increase. Moreover, in the case of such occupations it is difficult to vouch for the accuracy of each individual item for each district. It is possible that there may be wrong classification of particular class of cultivators as agricultural labourers. In numerous cases a rent-paying tenant is put down as an agricultural labourer and *vice versa*, more often the former. Also tenants of Crown lands in the canal colonies a re likely to have been returned as mere cultivators, and as such would be included among field-labourers. The increase in Montgomery, Gujranwala, Rawalpindi, Amritsar, Hoshiarpur and Simla Hill States has been over cent. per cent., and a large part of it must be real, particularly in Montgomery where cultivated area has largely increased during the last decade. Rohtak, Hissar, Ferozepore, Lahore, Sheikhupura, Lyallpur and Dera Ghazi Khan show an increase of between 50 and 100 per cent., and when the results for two or more of the neighbouring districts are similar, they furnish a strong testimony of the veracity of the figures. In Patiala, Karnal and Ambala (all contiguous) there has been an increase of between 20 and 50 per cent. There is an increase of less than 20 per cent. in the districts of Shahpur, Jhang, Multan, Muzaffargarh and Gurgaon, while there is an actual decrease in Mianwali, Jhelum, Gujrat and Mandi. This may be due to emigration or only to the local differences in the interpretation of the terms.

On the whole it will be safe to say that agricultural labourers have very greatly increased since last census.

Cultivating Owners and Co-sharers in Holdings.

155. At this census cultivating owners have for the first time been tabulated separately from tenants. The number of cultivating owners inclusive of subsidiary earners is 1,870,116 males and 102,831 females in British Territory, and the number of tenants is 1,706,964 males and 449,850 females. The number of cultivating owners will of course not be equal to the total number of owners of land entered as such in the records of rights, as all the co-sharers in a *khewat* (joint holding) do not cultivate the land, while many owners are joint in some and separate in other holdings. The table in the margin shows the number of holdings in each district of British Territory together with the number of co-sharers as well as the total number of cultivating owners according to our tables. It would seem that some of the sons of the owners, though separately cultivating part of the ancestral land have been returned as tenants, etc.

Statement showing the number of Jamabandi holdings, owners for the year 1930-31 *and Total cultivating owners given in Table No. X (Occupation).*

Serial No.	District.	Number of Jamabandi holdings for the year 1930-31.	Number of Co-sharers for the year 1930-31.	Total cultivating owners given in Table X (Occupation).

27	Multan ..	83,603	123,571	36,039
28	Muzaffargarh ..	139,795	206,749	48,515
29	Dera Ghazi Khan ..	103,388	248,563	36,547
	British Territory ..	**3,759,183**	**4,567,123**	**1,972,947**

The average size of an agricultural holding in each district is very difficult to determine.* But even when correctly determined, the mere size is of little value if the number of persons supported by each holding is not available. Thus in districts like Multan, Shahpur and Attock where holdings are fairly large, the average size of a holding will give an untrue picture of the conditions under which a cultivator works. The table in the margin shows the number of acres of cultivated land falling to the share of each worker engaged in cultivation whether as owner, tenant or agricultural labourer. The figures of workers only of Order I (*a*) have been taken as they are all workers in ordinary agriculture. The district with the smallest holding appears first. The districts seem to be more or less in the same order as in the table in paragraph 53 (page 74) arranged according to the incidence of rural population on matured area. It will be realised that the average area per agricultural worker nowhere exceeds 13·2 acres, the average for the Province working out to no more than 6·4 acres.

District.	Cultivated acres per worker engaged in cultivation (Sub-Class I Sub-Order *a*).	District.	Cultivated acres per worker engaged in cultivation (Sub-Class I Sub-Order *a*).
1	2	1	2
British Territory ..	*6·4*	Karnal ..	6·7
Simla ..	1·0	Muzaffargarh ..	6·7
Kangra ..	1·7	Lahore ..	7·1

Amritsar ..	4·5	Sheikhupura ..	8·1
Rohtak ..	4·7	Hissar ..	8·3
Gurdaspur ..	4·8	Attock ..	8·9
Sialkot ..	5·0	Montgomery ..	9·1
Ambala ..	5·1	Jhang ..	9·5
Rawalpindi ..	5·1	Ferozepore ..	9·9
Ludhiana ..	5·3	Multan ..	10·2
Gujrat ..	5·5	Shahpur ..	11·0
Jhelum ..	6·1	Mianwali ..	13·2

The figures of persons who have cultivation as a subsidiary means of livelihood have not been included in the above calculations. In 1921 there were 149,230 persons, recorded as 'partially agriculturists'. At this census there are 486,481 persons who being earners with a principal occupation have cultivation as their subsidiary means of livelihood. These half a million people and their dependants share the agricultural resources of the Province and the increase in their number is remarkably great.

The other groups under cultivation, namely, estate agents and managers of owners and Government, rent-collectors, clerks, etc., contain too few entries to require special notice. The decrease among them is due to the more or less complete absence of Settlement operations, the Settlement officials being usually the chief contributors to these groups.

Cultivation of Special Crops, etc.

156. The Sub-Order (*b*) of Order I, namely, "cultivation of special crops," is only notable for the small part it plays in the economic conditions of the Province. There are 8,035 workers (7,100 males, 935 females) of all kinds returned as engaged in it.

Forestry.

In Sub-order (*c*) of Order I, the number of Forest officers, rangers, guards, etc. (group 17) and wood-cutters, charcoal-burners and collectors of forest produce (group 18) has increased by cent. per cent. and 61·1 per cent., respectively. In Kangra the figures for Forest officers, guards, etc., are larger than those of wood-cutters, as the latter migrate to other places during the winter and were absent at the time of the census.

Particulars.	Males.	Females.
1	2	3
Earners ..	14,814	1,192
Working Dependants ..	981	815
Earners with Subsidiary Occupation ..	1,845	22

Stock-Raising.

157. In Sub-Order (*d*) of Order I, the total number of workers with stock-raising as their principal occupation has increased from 210,116 in 1921 to 256,564 in 1931. In addition to this there are 16,616 earners who are engaged

*See Calvert's Wealth and Welfare of the Punjab, page 74, where some of the difficulties are described.

in this work as subsidiary to some other occupation. The districts with the greatest number are Karnal, Shahpur, Lyallpur and Multan. In the groups under this sub-order there is an intercensal decrease among cattle-breeders, but the number of breeders of animals for transport, herdsmen, shepherds and breeders of other animals has increased.

Birds and Bees.

158. In Sub-order (*e*) of Order I, the number of keepers of birds and bees is almost negligible, though it shows an increase over the figures of the last census.

	Males.	Females.
Total workers 1931	76	6

Order 2. Fishing.

159. In the main group of Order 2, there are only 4,053 workers whose principal occupation is fishing as compared to 4,011 at last census, which means an increase of 16 per cent. There are 990 more earners who have fishing as an occupation subsidiary to some other. Fishing appears to be a spare-time job of Jhiwars and boatsmen, who do not often care to return it.

Sub-class II. Order 3. Exploitation of Minerals.

160. The number of persons engaged in the exploitation of minerals is very small. The only considerable figure belongs to the Rawalpindi Division where the coal and salt mines, cement rock and petroleum fields are situated. There is a decrease in this sub-class since 1921 owing no doubt to the recent depression. Mining of metals like iron, lead, silver, zinc and manganese is entirely unknown, while the handful of persons returned as mining gold are either "*Nayariyas*" or persons presumably employed on gold fields in Mysore, who happened to be home on leave at the time of the census. As regards the non-metallic minerals, there are salt workers of the salt range, situated in the Jhelum and Shahpur Districts, and workers in the washing of saltpetre, etc., chiefly in the Ambala Division. There are also some coal mines in Jhelum District, but the figures seem to be obscured by the return of a vague term "*kan men kam karna*" (working in mine).

Group 41, Other mines ..	276	..

Class B.

161. So far we have been dealing with Class A or with "the supply of raw material by exploitation of the surface of the earth, animals or vegetation." We shall now proceed with the next class B, that is with "the preparation and supply of material substances" or in other words Industry, Transport and Trade. We shall take each of the sub-classes individually.

Sub-Class III. Industry.

162. The map in the margin shows the population *per mille* of each district and state engaged in Industry. The proportion is highest in Lahore, Amritsar, Ambala, Gujrat, Jhelum and Gujranwala. Remote areas

Number per mille of the total population occupied as earners with principal occupation and working dependants engaged in Industry, 1931.

like Kangra, Dera Ghazi Khan, Bahawalpur, Chamba, the Simla Hill States and other states in the neighbourhood being the most backward in this respect. The chief industries are confined to the supply of the primitive needs of agriculture or household.

The figures of workers in Industries show a decrease of one per cent., which may be due partly to an increase in group No. 188, a portion of whose figures, if properly recorded, would undoubtedly have been included in some of the orders under Industry. The table in the margin gives the main figures of the various kinds of industries, the figures of group 188 being also shown.

Occupations.	Principal occupation (*Different kinds of Industry.*)	Total number of actual workers. 1931.	1921.	Increase+ or decrease−.
1	2	3	4	5
Sub-Class III	*Industry* ..	*1,791,609*	*1,793,162*	*−·1*
Order 5 ..	Textiles ..	400,628	400,258	+·1
Order 6 ..	Hides and Skins ..	16,992	22,858	−25·8
Order 7 ..	Wood ..	196,691	173,890	+13·1
Order 8 ..	Metals ..	83,847	77,296	+21·4
Order 9 ..	Ceramics ..	168,710	94,730	+14·8
Order 10 ..	Chemical Products ..	47,806	51,581	−7·7
Order 11 ..	Food Industries ..	87,206	88,936	−1·9
Order 12 ..	Industries of dress and the toilet	454,859	441,203	+3·1
Order 13 ..	Furniture Industries ...	1,099	1,551	−29·1
Order 17 ..	Miscellaneous ..	311,091	343,811	−9·3
Group 188 ..	Manufacturers, businessmen, .. contractors otherwise unspecified.	11,256	6,563	+71·5

Textiles.

The number of persons recorded as workers in textile industry is about the same as in 1921 while the total population of the Province has risen by 13·5 per cent. This may be partly due to the introduction of labour-saving devices and does not necessarily mean any decrease in output. The only industry to show a real increase in personnel is "Metals," under which the main occupations are blacksmithy, implement-making and the making of metal utensils for domestic use. The increase therefore is merely due to the expansion of local requirements as the industry carried on by the '*lohar*' (blacksmith) and '*thathiar*' (utensil-maker) is primarily to meet local needs.

	Males.	Females.
Earners ..	304,038	45,516
Working Dependants ..	16,733	32,341
Earners with Subsidiary Occupation ..	25,951	4,365

Metals.

Group 59, Blacksmiths	Males.	Females.
Total workers 1931 ..	91,314	1,775

Groups 60 and 61, Utensil makers	Males.	Females.
Total workers 1931 ..	7,321	57

Ceramics.

Another industry showing expansion almost commensurate with the increase in total population is ceramics, which has pottery as its chief item. The need supplied by the potter is evidently increasing at the same rate as the population.

Group 63, Pottery.	Males.	Females.
Total workers 1931 ..	108,441	5,881

Wood.

Wood is another industry which shows an increase corresponding to the rise in the population. The main group in this order is that of carpenters and turners, and the carpenter like the blacksmith and the potter is just as much in demand as before.

Group 55, Carpentry, etc.	Males.	Females.
Earners ..	149,571	1,974
Working Dependants ..	7,997	884
Earners with Subsidiary Occupation ..	14,553	49

Food Industries and of Dress and Toilet.

These industries seem to be more or less stationary. It may be added that those engaged in food industries are in most cases also the sellers, and thus the figures are liable to a slight interchange. There is a small increase for instance among sellers of sweetmeats, and part of it is possibly due to this interchange.

Hides and Skins.

These industries show a large decrease, and very probably numerous persons engaged in tanning, mainly Chamars, have returned some agricultural occupation.

Chemical Products.

The Chemical industry does not seem to be flourishing, having declined by about 8 per cent.

Sub-Class V. Trade.

164. The last sub-class of Class B is trade, and the number of persons employed therein shows an increase, which is really larger than is indicated by the figures owing to an inaccuracy in the 1921 figures. Some of the figures are reproduced in the margin for facility of reference. Orders 23 and 24 which deal mainly with commerce show a decrease as compared with the figures of 1921, which can be explained only by a decrease among money-lenders. It is rather striking that the number of persons engaged in commerce should be relatively so small.

Sub-Class or Order.	Occupation.	Actual Workers. 1931.	Actual Workers. 1921.	Variation per cent.
1	2	3	4	5
Sub-Class V.	**Trade** ..	*617,118*	*583,428*	*+5·8*
Order 23	Banking and Exchange ..	43,479	44,503	−2·3

Order 36	Trade in means of Transport	13,864	21,567	−35·7
Order 37	Trade in Fuel ..	7,785	2,517	+209·3
Order 38	Trade in articles of luxury ..	5,973	6,713	−11·0
Order 39	Trade in other Sorts ..	252,721	93,531	+170·2

Commerce.

Money-lenders.

According to the present returns, there are in group 115 (which includes bank managers, money-lenders, money-changers, etc.) in the British Territory 30,923 males and 1,191 females returned as such in the column of principal occupation. In addition to this there are 4,661 males and 88 females returned as working dependants. These must be persons, who follow this occupation in order to assist the head of the family in his daily business. Thus the total number of persons engaged in money-lending, etc., as principal occupation is 36,863 persons (35,584 males and 1,279 females). There are, moreover, 11,513 males and 86 females, with whom money-lending is a subsidiary occupation, and apparently the majority of these are agriculturist money-lenders. The number of workers in the corresponding group in 1921 was 38,132 persons (35,043 males and 3,089 females), and there is thus a decrease among money-lenders pure and simple. The census returns, however, may not be quite complete as the occupation of money-lending has become unpopular in many places and may therefore not have been returned as such.

In the Provincial Banking Inquiry Report (1930) at page 129 we find the following remarks :—

" The chief problem of banking in the Punjab is the problem of the money-lender. In 1922, Mr. Calvert calculated the number of money-lenders at about 40,000. This estimate appears to have been based upon various statistical returns, mainly relating to income-tax and none later than 1918-19. Little account can have been taken of either the agriculturist or the female money-lender, because the latter has probably never appeared in the income-tax returns, and the former has only begun to do so since 1921, when income-tax administration became more efficient. We shall see presently that agriculturist money-lenders, excluding those who advance only against mortgage, number about 19,000. It is impossible to calculate the number of women who lend, but the evidence of the Inspectress, Co-operative Societies, shows that it must be considerable, for about 5 per cent. of the 2,000 members of women's co-operative societies apparently make a practice of it. The Census Report for

1921, on the other hand, states that the number of ordinary money-lenders has almost certainly declined. If we set off the number of women who lend against this decline, we are still left with 59,000 money-lenders. Tentatively, therefore, but cautiously, we may say that in the Punjab there must be at least 55,000 who depend solely or in part upon money-lending. We are upon surer ground when we add that after agriculture money-lending is the most important industry in the Province, and that in 1928-29 it paid 36 per cent. of the total income-tax by business and industry....."

On page 133 of the same Report the reasons given for the decline in money-lending business are summed up as follows :—

"All agree that the *sahukar* is reducing his business. For this many reasons are assigned, the most important of which are the following:—

(*a*) The legal protection given to the peasant proprietor borrower, combined with a greater tendency on his part to take full advantage of it ;

(*b*) the rise of the agriculturist money-lender ;

(*c*) the rapid growth of co-operative credit societies, and

(*d*) the counter-attractions of trade."

Order 25. Trade in Textile.

Trade in textiles has shown a fairly big increase. This order includes the "*Bazaz*" (cloth merchant), who has plied a profitable trade during the prosperous years of the last decade.

Order 26. Trade in Skins, Leathers and Furs.

This industry appears to have declined, but the trade in skins which is the chief item in this order shows an increase of 19·4 per cent.

Wood, etc.

There is an increase in the trade in wood, pottery, bricks and tiles, but the trade in chemical products like the industry shows a decline. The comparatively small trade in metals seems to be growing.

Order 31. Hotels, etc.

Hotels, cafes and restaurants show a big increase indicative of a new social development. Formerly taking refreshments and meals at hotels and restaurants was almost unknown, but with the increased facilities of travelling the habit is spreading and promises to play a prominent part in the social life. Thus in a place like Lahore the house-wife could in many cases be considerably relieved of her ordinary duties and will find more leisure for handicrafts such as embroidery, knitting and spinning.

Order 32. Trade in Food Stuffs.

There is a decrease in this order due almost entirely to the transfer of "*dukan nun-tel*" (a popular term for the village general merchant) from group 134 to group 150. The village general merchant deals in all kinds of commodities for daily use, from sugar candy to medicinal herbs, from paraffin oil to rat poisons, and what not.

Order 33. Trade in Clothing and Toilet Articles

This order deals with the "*bisati*" *par excellence*, and shows an increase nearly proportionate to the general rise in the total population.

Smaller Trades.

The figures of Orders 34, 35 and 36 are too small to need any comment except that trade in building material seems to be on the increase. The decrease in Order 35 is due probably to the great decline in the number of sellers of *ekkas*, tongas and other carts, and also to the centralization of the motor trade in large towns.

Fuel etc.

Trade in fuel has grown though its figures are even now rather small. This trade is generally combined with some other trade such as selling of *bhusa* (straw). The trade in articles of luxury has declined, there being a big decrease

in sellers of bangles, necklaces, etc. There is an increase in Order 29, Trade of other sorts, due to the reasons referred to above, namely, the inclusion in it of village shopmen.

Class C. Administration. Public Force.

165. The next class of occupation C is "Public Administration and Liberal Arts." The main figures are given in the margin. There is a large decrease in the Imperial Army, and a slight decrease in the Air Force, while the figures for the Indian States Army show a small increase. In the British Territory there were 41,609 persons, both principal workers and with subsidiary occupation, in the Police, or 2 *per mille* of the total population. Village watchmen show a big increase, partly due to the increase in the number of villages, and work out at one *per mille* of the total rural population.

Class, Sub-Class or Group.	Total number of actual workers. 1931.	1921.	Increase or decrease per cent.
1	2	3	4
Class C.	*413,763*	*374,175*	*+10·6*
VI.—Public Force ..	103,620	117,415	−11·7
153 Imperial Army ..	40,346	74,614	−43·9
154 State Army ..	9,863	9,515	+3·7
155 Navy ..	..	24	−100·0
156 Air Force ..	137	208	−34·1
157 Police ..	29,209	23,865	+22·4
158 Watchman (village) ..	24,065	9,189	+161·9
VII.—Public Administration	*96,716*	*56,813*	*+70·2*
159 Service of the State ..	50,864	30,092	+69·0
160 Service of Indian and Foreign States ..	14,325	11,311	+26·6
161 Service of Local Bodies..	16,624	6,125	+171·4
162 Village Service ..	14,903	9,285	+60·5

Service of the State.

166. There is a big increase under Public Administration. In British Territory the number of servants of the State works out at 2 *per mille* of the total population, while their proportion in the Punjab States is 3 *per mille*. There is also a very big increase in the number of servants employed in local bodies. It is possible however that some of the servants of local bodies have been included in State service or *vice versa*. The classification of Public Service is difficult as vague terms such as "*naukar sarkar*" creep in and are difficult of allocation to different departments. It is perhaps needless to add that every endeavour has been made to include in this category all State servants except the employees of the Irrigation and Postal Departments as well as the P. W. D. officials engaged on roads and buildings, professors, teachers and doctors, who go under other heads. The figures are also obscured by some of the State servants choosing to return rent-receiving, *Jagir*, bank interest, etc., as their principal and subsidiary occupations.

Professions and Liberal Arts.

167. The sub-class VIII shows an increase of 6·7 per cent. over the figures of 1921. The main figures for the two censuses are given in the margin. There is a marked increase in Law, Medicine and Instructions, though Religion shows a decrease. If the groups in each order are examined we find the biggest increase among lawyers and teachers. In Order 49, Letters, Arts and Sciences, there is an increase of 38·8 per cent. among journalists, etc. (group), but the total number is still no more than 3,298. The most numerous category of musicians, etc., (group 178), shows a decline, in no way unexpected, while astrologers, acrobats, etc., (group 181), have increased.

Sub-Class VIII.	*Professions and Liberal Arts.*	1931.	1921.	*Variation per cent.*

CHAPTER IX

LITERACY.

174. General. 175. Local distribution of literacy. 176. Literacy in cities and selected towns. 177. Literacy by main religions. 178. Progress of literacy in the younger generation. 179. Returns of Education Department. 180. Adult literacy, 181 Literacy by selected castes. 182. Literacy in English. 183. English literacy by castes. 184. Literacy in vernaculars. 185. Comparison with other provinces.

Reference to Statistics.

The absolute figures for literacy by age, sex and religion are given in Imperial Table XIII; Part A contains the provincial summary, and Part B the details for each district and state, while Part C shows the details for cities and selected towns. Imperial Table XIV gives the details of literacy by certain selected castes, tribes and races.

The Provincial Tables, in Part III of this volume, are XIII-A., giving the statistics of literates in the four vernaculars, Urdu, Hindi, Gurmukhi and Roman by religion for the whole Province, its main political divisions and each district and state, and XIV-A. giving literacy figures of the three sects of Vedic Dharm, Brahmo and Dev Dharm.

Of the nine Subsidiary Tables which show derivative figures of literacy and are briefly described below, eight appear at the end of this Chapter.

Subsidiary Table I gives the literacy *per mille* by age-groups, sex and religion for the whole Province as well as the number of total literates in English *per mille* of the population, aged 5 years and over. This is reproduced in the text.

Subsidiary Table II gives the number of literates *per mille* by age, sex and locality for each district, state and Natural Division.

Subsidiary Table III gives by religion, sex and locality for each district, state and Natural Division the total literacy *per mille* of the population, aged 5 years and over, the number of literates in certain vernaculars and the number of the primary-passed per 1,000 literates.

Subsidiary Table IV gives by sex and locality for each district, state and Natural Division the number of literates in English per 10,000 of the population in the four age-periods, 5—10, 10—15, 15—20 and 20 and over for the 1931 Census as well as the number of total literates (for each sex separately) in English per 10,000 of the population aged 5 years and over for the four decades, 1891 to 1931.

Subsidiary Table V gives for the two censuses of 1931 and 1921 the number of literates *per mille* as well as the number of literates in English per 10,000 of each selected caste.

Subsidiary Table VI gives the number of literates of both sexes *per mille* of the total population in each of the six censuses since 1881 and for the three age-groups, 10—15, 15—20 and 20 and over, for the last two censuses for each district, state and Natural Division, separately.

Subsidiary Table VII gives by sex, the absolute figures of population, literacy and literacy in English for four age-periods, 5—10, 10—15, 15—20 and 20 and over, for the whole Province.

Subsidiary Table VIII shows the growth in the number of educational institutions, scholars and expenditure on education from 1889-90 to 1930-31, based on departmental returns.

Subsidiary Table IX gives the total number of schools and scholars by tahsil and district as well as the average number of scholars per school in each case according to the information supplied by the Director of Public Instruction, Punjab. These figures relate to the year 1930-31.

174. The instructions to enumerators with regard to the return of literacy were as follows :—

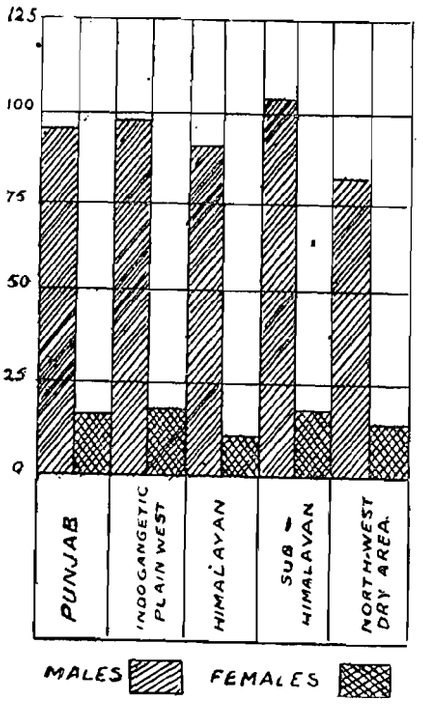

"*Col.* 16 (*literate or illiterate*).—If literate in Urdu write Urdu; if literate in Hindi write Hindi; if literate in Gurmukhi write Gurmukhi; if a person can read and write in Roman characters write "Roman." Otherwise enter against all persons, who can both read and write a letter in any other language the word "literate." If not, make a cross (×)."

The test of literacy, which was the same as at the last three censuses, was thus simple enough, *i.e.*, the ability to read and write a letter. The actual figures of literates in the Province and its two main political divisions are given in the margin together with the proportion of literates 5 years and over *per mille* of each sex. Even according to the simple test of ability to read and write a letter, the number of literates in the whole of British Territory is 1,097,044 males and 150,713 females, or 100 and 17 *per mille* of the total population aged 5 years and over of each sex, respectively, as compared with 77 and 10 *per mille* at last census. The intercensal increase in literates amounts to 45·4 and 92·9 per cent. among males and females, respectively, as against 13·9 and 14·1 per cent. increase in the actual population of each sex. In spite of the large increase in the number of literates the amount of illiteracy is still very great, the actual number of illiterates aged 15 and over in British Territory (15,608,462) being greater than in 1921 (14,148,847).

Territorial Division.	Literate aged 5 years and over 1931.			
	Males.	Females.	Proportion *per mille* of each sex.	
			Males.	Females.
Punjab ..	1,258,742	163,200	95	15
British Territory ..	1,097,044	150,713	100	17
Punjab States ..	161,698	12,487	70	7

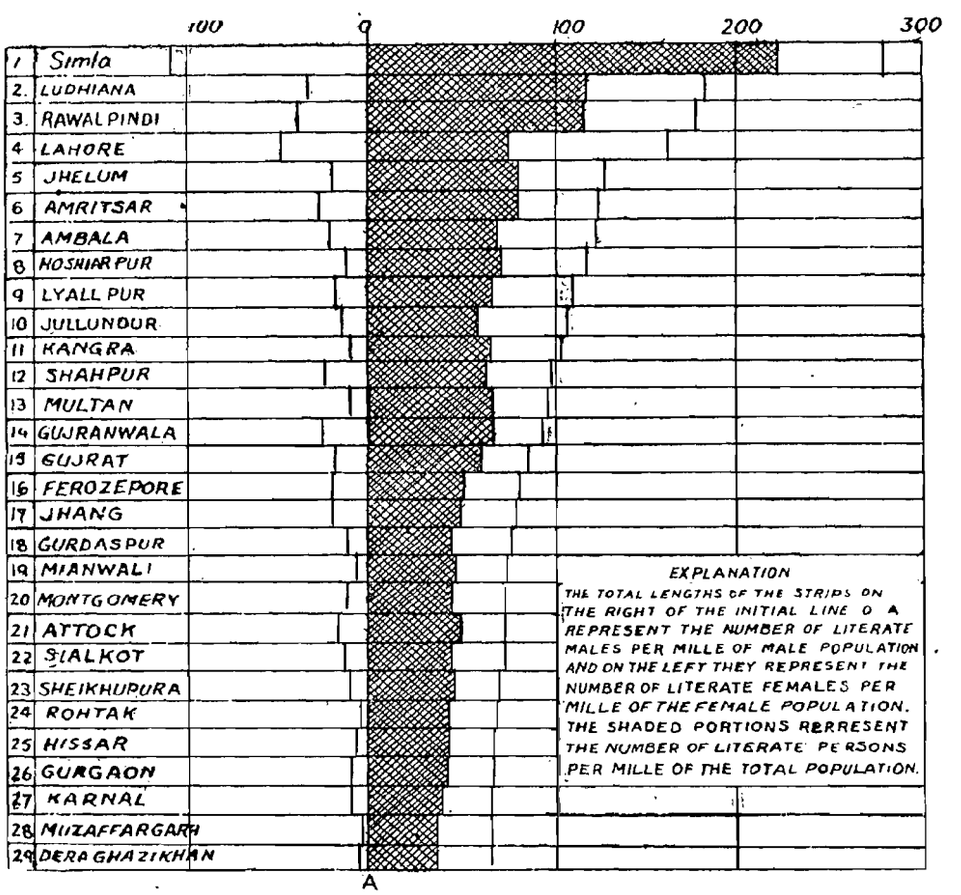

Local Distribution of Literacy.

175. The distribution of literates may first be examined by Natural Divisions. The diagram in the margin shows by means of rectangles the number of literates *per mille* of each sex in each Natural Division. The Sub-Himalayan Division shows the highest amount of literacy, both male and female. The Indo-Gangetic Plain comes next, followed by the Himalayan, the North-West Dry Area being the most backward. This distribution is indicative of the fact that a high proportion of literacy obtains in areas, whose development took place several decades before the canal colonies in the North-West Dry Area came into existence.

Number of persons per 1,000 who are literates in each Natural Division.

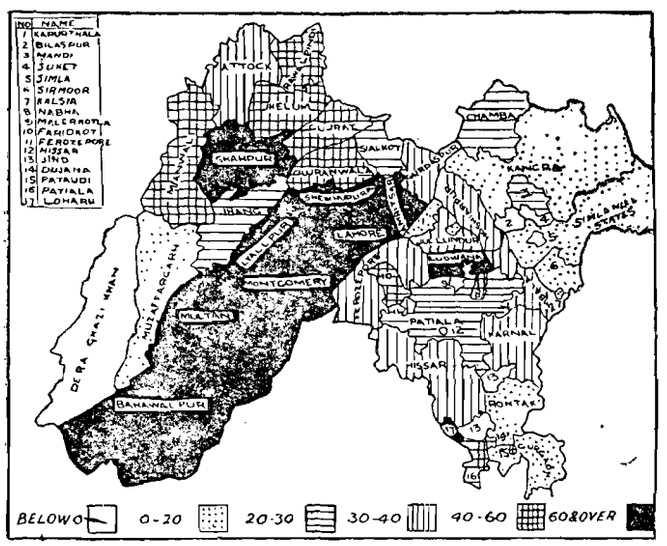

The diagram below shows the distribution of literacy *per mille* of the total population of all British districts. The literacy of males *per mille* of the male population is shown by the entire length of the rectangles on the right side of line O A, its shaded portion representing literacy *per mille* for both sexes. The smaller rectangles on the left represent female literacy.

Extent of literacy generally and among males and females per mille *by districts.*

The districts have been arranged in the order of male literacy, and we find that Simla with a large number of persons engaged in Public Administration

has the largest proportion of literacy, both male and female. Of the districts in the plains, Ludhiana, Rawalpindi, Lahore, Jhelum, Amritsar, Ambala, Hoshiarpur, Jullundur, Kangra, Shahpur and Multan appear at the top in point of male literacy. With the exception of Lahore, which is the capital of the Province and the biggest educational and a large business centre, the high percentage of literacy in these districts seems to be considerably affected by the large number of ex-soldiers residing in those districts or owing to the existence of cantonments. The high incidence of literacy in Ludhiana is mainly due to its being a small compact district, with a large Sikh population, which finds it comparatively easy to become literate in their peculiar script, Gurmukhi. The same applies to the Sikh population of Rawalpindi. The returns of some districts might slightly be affected by bogus returns, a fact to which reference will be made later in this Chapter. The most backward districts in point of literacy would seem to be Dera Ghazi Khan, Muzaffargarh, Karnal, Gurgaon, Hissar and Rohtak. The map in the margin shows the increase per cent. for the last decade in literates of all ages and of both sexes in each district and state of the Province. There has been a big increase in literacy in the central districts, Ludhiana, Amritsar and Lahore, the colony districts, Sheikhupura, Lyallpur, Montgomery, Multan and Shahpur, and Bahawalpur State. In these areas the increase in total population has also been about the biggest. The increase in the three first-named districts is solely due to an advancement in literacy on the part of the population, a factor probably only secondary in the case of colony districts, where the main cause is immigration. A big natural increase, which means a replacement of the old population by children, might easily result in retrogression so far as "proportional" literacy is concerned, but immigration which for the most part adds adults to the population often causes the opposite result. Men in the various branches of public service, lessees, land-agents, shopkeepers, etc., whose number goes up with the colonization of a tract, mean so many literates added to the population of a locality.

Variation per cent. among literates of all ages (1921—1931).

Of the districts named above Ludhiana and Shahpur, and most of the districts with the next highest percentage of increase, namely, Rawalpindi, Jhelum, Gujrat and Mianwali, also owe the increase in literacy to the return home of demobilized soldiers, who very often pick up reading and writing in Roman or in one of the vernaculars in the course of their military career. The large percentage increase among literates in Mianwali is due to the recent prosperity, consequent upon a large rise in cultivated area during the last decade.

The percentage increase in Gujranwala, Nabha and Chamba too, is high and though in Gujranwala like Amritsar and Lahore this repre-

advancement in literacy, the increase in the case of the two states is more apparent than real. For instance, the number of literates in Chamba has only risen from 3,238 in 1921 to 4,610 in 1931 and even now only 36 persons *per mille* are literate.

The increase in literacy in Attock, Gurdaspur, Hoshiarpur, Jullundur, Ambala, Maler Kotla, Ferozepore, Hissar and Karnal is very considerable, and all these districts with the exception of Attock belong to the eastern half of the Province. The increase in Jhang, Sialkot, Mandi and Patiala is quite small, and in Sialkot, as remarked in Section 7 of Chapter I, rural population has decreased during the last decade. The smallest increase in literacy is to be found in Rohtak, Gurgaon, Kangra, Muzaffargarh, Sirmoor and the Simla Hill States. The only district which has registered a decrease in literacy is Dera Ghazi Khan.

Literacy in Cities and Selected Towns.

176. The table below gives the absolute as well as the proportionate figures of literates *per mille* of the population in each of the cities and selected towns of the Province, the figures for literacy in English being also shown. So far as the absolute figures are concerned, Lahore City—the educational centre of the Province—is at the top both in respect of general literacy and literacy in English. Nearly one-fourth of its inhabitants can read and write, but only 43,000 inhabitants are literate in English, about one-eighth of whom are females. From the standpoint of the proportion of literates in the total population Lyallpur eclipses Lahore both in respect of literacy of all kinds and literacy in English. Even the town of Sargodha seems to be better off than Lahore in respect of the proportion of literates *per mille* of the total population. These facts need not occasion a surprise, as the causes responsible are not difficult to locate. For example, a contributory cause may be the different interpretations of instructions or the overzeal of a citizen to return himself as literate. Moreover, according to the census definition a University graduate as well as a *Mahajan* knowing only *Lande* or *Hindi Mahajani* (business script) is returned as literate, and Lyallpur and Sargodha are the chief colony towns, crowded with businessmen, and have also a large proportion of persons employed in occupations connected with Public Administration and the Liberal Arts and Professions as compared with Lahore, which has a large proportion of old residents.

Town.	Total Literates.			Literates in English.			Number of Literates *per mille* of the Population 5 years and over.					
							Total Literacy.			*English Literacy.*		
	Persons.	Males.	Females.	Persons.	Males.	Females.	Persons.	Males.	Females.	Persons.	Males.	Females.
Lahore	100,885	81,631	19,254	42,916	37,438	5,478	269	333	149	114	153	42
Amritsar	39,937	32,643	7,294	12,288	10,485	1,803	174	231	82	53	74	20
Multan	15,301	13,596	1,705	5,035	4,640	395	147	225	39	48	77	9
Rawalpindi	27,523	24,769	2,754	12,397	11,158	1,239	264	364	76	119	164	34
Sialkot	12,054	10,987	1,067	4,844	4,145	699	140	210	32	56	79	21
Jullundur	14,028	11,607	2,421	4,262	3,823	439	183	259	76	56	85	14
Ambala	16,180	13,479	2,701	6,367	5,954	413	214	293	91	84	129	14
Ludhiana	11,898	8,891	3,007	4,772	4,173	599	200	251	124	80	118	25
Ferozepore	12,210	10,126	2,084	4,550	4,164	386	216	292	96	81	120	18
Lyallpur	14,546	11,190	3,356	4,621	4,022	599	389	453	264	124	163	47
Sargodha	7,517	5,494	2,023	2,324	2,159	165	327	378	240	101	149	20

The amount of literacy in other towns requires no special notice except that the figures for towns with cantonments are comparatively higher. For example, the number of literates in Rawalpindi and Ambala seems to be particularly affected by this cause.

Literacy by Main Religions.

177. The absolute figures of literacy are given by religions and main age-periods in Table XIII. Subsidiary Table I below shows the proportional distribution of literates *per mille* by age for each religion and sex for the whole

SUBSIDIARY TABLE I.

*Proportion is calculated on the population of the age-period concerned and not on the total population.

Province. Europeans and Anglo-Indians naturally have the largest proportion, while Zoroastrians (Parsis) are a good second. In general literacy Hindus and Sikhs are nearly equal but very much behind Jains who as a rule belong to the trading classes, mainly Aggarwal. The literacy among Muslims is about the lowest, being even lower than that among Indian Christians, whose females are particularly well advanced. The amount of literacy is not only small among Muslims of all ages, but the number of literates *per mille* of (school-going) ages 5—10 and 10—15, is even now less than half that of Hindus. In the higher ages the proportion drops to about one-third. Ad-Dharmis can lay no claim to literacy to any considerable extent, and their proportion is nearly half that for Muslims. Buddhists dwell mainly in the remoter parts of Kangra District and the Simla Hill States, and most of them are illiterate.

One of the important causes for the comparatively small number of literates among Muslims is that unlike Hindus and Sikhs they do not, to any appreciable extent, acquire literacy without going to school. The only sphere of life, which gives them an opportunity to become literate in adult age, is military service. In the case of Hindus and Sikhs their occupations very often help them in learning to read and write. This is borne out by the high proportion of literates among Jains. The proportion of literates among the trading class of Hindus, such as Arora and Khatri, is similarly very high. Among Sikhs a large number of artisans pick up reading and writing in their every-day business, and numerous Sikh women are literate in Gurmukhi, which is not at all difficult to learn. The proportion of literacy is higher among Sikh females than among the Hindu, and it is even more pronounced among the young generation (female children aged 5—10). As compared with Muslims the proportion of literates among Hindus and Sikhs becomes higher at ages over 15. This may be due to several causes, such as the greater possibility of relapse into

illiteracy among Muslims or the greater advance made by them only in recent years. A corroborative fact is that the proportion of the primary-passed is smaller among Hindu and Sikh literates than among the Muslim.

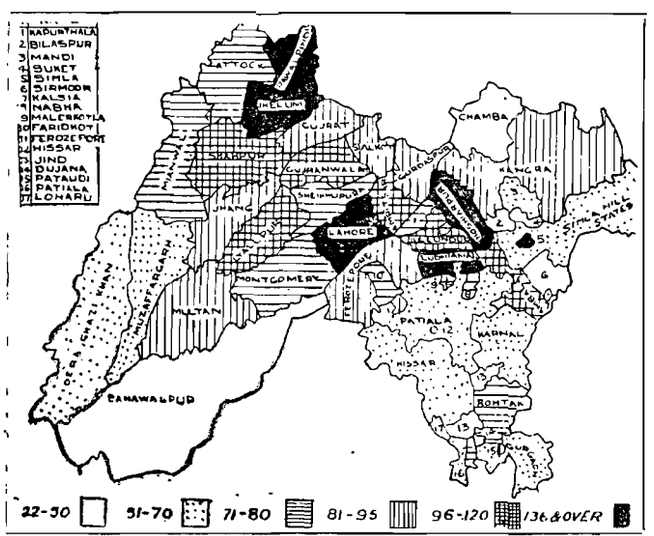

Proportion of primary-passed per 1,000 literates.

Locality.	Hindu.		Sikh.		Muslim.		Christian.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Punjab ..	*512*	*239*	*406*	*118*	*755*	*650*	*302*	*420*

IV.—North-West Dry Area ..	487	189	436	113	771	506	495	624

In the marginal table are given the proportions of the primary-passed* *per mille* of all literates belonging to the main religions in each Natural Division. It shows that more Muslim literates of both sexes are primary-passed than literates of all other religions. Very few of the literate Sikh females are primary-passed indicating that they pick up Gurmukhi at home.

Progress of Literacy in the Younger generation.

178. The advance made in literacy during the last decade, no doubt mainly due to the activities of the Education Department, is confined mainly to persons aged over 10 and under 20. It is believed to be mainly responsible for the proportion of literates in ages 10—20. The map in the margin shows the proportion of literate males of these ages *per mille* of all males of those ages enumerated in each district or state. This proportion would seem to be highest in Lahore, Hoshiarpur, Simla, Ludhiana, Jhelum and Rawalpindi (136 and over *per mille*), the next highest proportion (over 95 *per mille*) obtaining in Shahpur, Lyallpur, Gujranwala, Amritsar, Jullundur and Ambala. The districts with a proportion lower than 95 *per mille* are Multan, Jhang, Gujrat, Sialkot, Gurdaspur, Ferozepore and Kangra, followed by Rohtak, Montgomery, Sheikhupura, Mianwali and Attock and the States of Nabha, Pataudi, Faridkot and Kapurthala. The proportion of literates is very small in the Districts of Hissar, Gurgaon, Karnal, Muzaffargarh and Dera Ghazi Khan and the States of Patiala and Mandi, the Simla Hill States and Sirmoor, while the remaining states show a still smaller proportion. It is unsafe to generalize about the amount of literacy imparted in schools, but it appears that in most of the districts the educational institutions (schools, *pathshalas* and *maktabs*) at present in existence have not turned out male literates from amongst the members of the younger generation (aged 10—20) in excess of 95 *per mille*, which is the average proportion of male literacy in the Province for all ages. In these districts literacy is hardly making any headway, and the hope of spreading education in the backward tracts in order to raise the provincial proportion of literacy seems to be far from realization. When this younger

Male literates aged 10—20 per mille of the Boys of the same age (1931).

*Primary-passed was defined as a person, who passed the fifth class in or before 1919 and the fourth class after that year. The primary standard was reduced from five to four classes on 1st April 1919.

generation grows up, the position of the Province will, I am afraid, not be substantially better than it is now. The census figures of literacy could not be materially wrong, and if an error at all exists it would be due rather to the overzeal on the part of a community to swell the figures of its literates. In the face of these facts the view expressed in the Annual Report on the Progress of Education (1930-31, p. 12) quoted below might occasion some surprise.

"Time was when we heard much of the backwardness of the Multan Division and in particular the ills of Muzaffargarh but our Inspector of the Multan Division writes :—

"The percentage of boys at school to the male school-going population ranges from 61 to 81 as shown in the following table :—

Montgomery	81 per cent.
Jhang	81 „
Lyallpur	77 „
Multan	75 „
Dera Ghazi Khan	69 „
Muzaffargarh	61 „

"These figures again approach what we used to hope to achieve only through compulsion. The second class in this Division is 44 per cent. of the first, and the fourth class is 78 per cent. of the enrolment in the third."

Returns of Education Department.

179. It will be of interest if we could here summarize the position of the Province from the standpoint of educational progress as gathered from the statistics published by the Education Department in their annual reports. The figures given in the margin show the number of scholars (both sexes) in the different stages in all the schools in British Territory for each year of the last decade. According to the view expressed by the Indian Statutory Commission* a sustained course of instructions for a minimum period of four years is essential to establish a literacy that lasts. About two-thirds of the scholars in the fourth stage may thus be regarded as becoming literate every year. If the figures at one stage are compared with the figures for the next higher stage in the following year the amount of 'stagnation' will be evident.

Number of pupils (males and females) in schools by stages.

Year.	Class I.	Class II.	Class III.	Class IV.	Literates below 20 surviving at the time of census (taking ⅔ of Class IV and allowing 15 *per mille* as death-rate annually).
1	2	3	4	5	6

1926-27	440,561	178,109	96,132	82,911	51,958
1927-28	457,046	203,316	105,812	84,244	53,636
1928-29	412,140	218,690	117,981	90,266	58,372
1929-30	443,370	232,897	128,536	97,954	64,323
1930-31	474,622	242,303	134,691	106,619	71,079
Total literates below 20 estimated from departmental returns (1922-31)					457,636
Literates below 20 according to the 1931 Census (British Territory) "					393,842
Difference "					63,794

The figures of literates turned out during the last nine years very approximately give the total literates below 20 at this census after an allowance is made for the deaths during the last decade. In the last column of the table above an estimate of the survivors has been made on the assumption of an annual death-rate of 15 *per mille*. The number actually returned as literates below 20 at this census has also been given. The difference between the estimated outturn and the actual figure might be regarded as due to relapse into illiteracy of boys, who passed their fourth class in the early years of the decade, and to some of them being now above 20, which is not at all improbable. The primary standard was reduced from 5 to 4 classes in 1919, and the amount of relapse during the last decade would naturally be greater than before.

Sikh	3,472	2,132	1,340	389	195	194

The second column of the table shows the figures of male literates aged 20 and over in 1931. In column 3 are shown the figures of literates who would be still surviving out of the 1921 literates aged 10 and over, the death-rate of 150 *per mille* during the last decade having been applied to obtain their number. It will be conceded that the assumed death-rate is not at all excessive and should at the same time leave enough margin for slight movements of population that might have occurred. Column 4 gives the excess of the figures in column 2 over those in column 3, while columns 5, 6 and 7 show similar results for females. It is evident that figures of all religions show an excess of varying magnitude, being due mainly to adults having acquired literacy.

We have dealt so far with the districts, in which the excess in literacy figures among persons aged 20 and over was transparent. The figures for other districts may also contain a small increase in adult literacy, but not large enough to wipe out the effect of deaths among literates during the last decade and thus to show an actual excess in the present figures. Details for each district need not be gone into, but a reference to the total figures for British Territory is necessary. The figures in the first six lines of the table above give the information for the total British Territory similar to that about the districts appearing in the table. The figures for Christians and Jains, which have also been added, do not show any acquisition of literacy by adults. Jains become literate in early life while numerous Indian Christians have occupations which

afford no opportunity for acquiring literacy in adult age. On the whole we find from columns 4 and 7, in respect of literacy among adults, an increase of 135,125 in males and 22,476 in females of all religions, while the degree of increase varies in the case of the three main religions. Assuming the excess to be 100 among Sikhs the proportions of increase will be as given in the margin. It has, however, to be remembered that many literate Hindus who adopt Sikhism at each census swell the figures of literacy among Sikhs. Hindus come next in this respect, while Muslims, especially their females, seem very apathetic.

	Sikh.	Hindu.	Muslim
Persons ..	*100*	*32*	*23*
Males ..	100	25	29
Females ..	100	39	17

In paragraph 156 of the 1921 Report, Mr. Jacob made a forecast of the number of literate males above the age of 20 at this census. He estimated an annual increase of 50,000 as a result of the attainment of fresh literacy by boys at school. To the probable survivors of these he added the probable survivors of the literates of 1921, and thus obtained the figure of 814,808 as the total number of male literates over 20 in British Territory at this census. His surmise about the number of literates, turned out by the schools during the last decade, has proved to be fairly correct, but what he seems to have overlooked is that a great majority of these boys would be still below 20 in 1931. The literates now aged 20 and above comprise (1) the survivors of all literates aged 10 and over of 1921, (2) the persons who became literate in adult age during the decade, and (3) a certain number of boys who attained literacy at school during the first year or two of the last decade. The number of literates of the last two categories could not have been predicted with any amount of precision.

Literacy by Selected Castes.

181. The table below shows the literates *per mille* of the total population of certain selected castes for the 1921 and the present census.

In each and every caste except Sansi, whose 1921 figures seem to be excessive, there is an increase in the number of literates, both male and female.

The table also shows how certain castes, such as Aggarwal, Khatri and Arora, have stood out at both the censuses with a prominently high percentage of literacy. The figures of these castes would compare favourably even with those of Europeans, Anglo-Indians or Zoroastrians, if the comparison were confined to persons between the ages of 15 and 40. Brahmans, Sayads and Sheikhs seem to be literate in fairly large numbers, and to a lesser extent Pathans and Kashmiris. The agricultural castes are, of course, very backward, but Rajputs, who receive large accretions from the well-to-do and educated members of lower castes, and Sainis are proportionately better educated, while of the others Kambohs, Jats, Awans and Arains are almost on the same level. The Ahirs, Gujjars and Meos are in the background, though the two last-named have made much progress during the last decade. As regards the artisan castes, such as Lohar and Tarkhan, there is not much to choose between them and their agriculturist neighbours Jat and Arain, while the Sunar (goldsmith) is comparatively much better off. Of the village menials, *Kumhar*, *Mochi*, *Teli*, *Machhi* and *Dhobi* are still backward, and the criminal tribes under State supervision have drawn level with them, the Pakhiwara actually claiming a higher proportion of literacy. The depressed classes, namely, Dagi and Koli, Chamar and Chuhra, and their Muslim counterparts, Mochi and Mussalli, are the most backward of all.

Literacy in English.

182. In British Territory there are now 230,390 males and 19,217 females who are literate in English as compared with 128,242 males and 11,293 females in 1921. Excluding the Europeans and Anglo-Indians the literates in English comprise 222,006 males and 17,117 females, or 22 and 2 *per mille* of the population of each sex over 5 years old, respectively.

The progress of English literacy is shown below by an extract from Subsidiary Table IV, the figures of general literacy being also shown side by side.

Natural Division.	*Total number of literates per mille.**								*Literates in English per 10,000 of each sex aged over 5.*

IV.—North-West Dry Area	82	13	62	7	60	4	69	3	126	9	70	4	54	4	46	3

* The proportion of literates for 1931 and 1921 has been worked out on the basis of the population of each sex aged over 5, and for 1911 and 1901 on the basis of the total population.

English literacy like that in vernaculars is making progress everywhere with this difference that in its case the Himalayan Division is more backward than the North-West Dry Area.

English Literacy by Castes.

183. The literacy in English is most widespread among the castes noted in the marginal table, which compares the number of literates in English per 10,000 of the total strength of each caste with that of 1921. The castes are arranged alphabetically. The Khatris, both male and female, have the largest proportion of literates in English. The Sheikhs, Sayads, Aggarwals, Brahmans and Aroras come next in the order. The Kashmiris take the seventh place, having doubled their proportion since last census, and are followed by Pathans.

Statement showing the number per 10,000 *of the total strength of each caste.*

Ram Daiji is the name of a Hindu deity and the persons returned as members of this sect really belong to Sanatan Dharm.

Ram Daiji. (Hissar, 15 males and 18 females.)

Singi Kat is the profession of certain persons who extfact blood from sick persons with the aid of *singi*, a small horn-shaped instrument made of horn and iron. The persons entered as members of this sect are really Sanatan Dharmis.

Singi Kat. (Hissar, 10 males and 13 females.)

Dhawal Pal and Dharam Premi are two different names for the Brahmanic Hindus and Vedic Dharmis, respectively. The members of these sects are found only in the Sialkot District, their total number being less than 500.

Dhawal Pal and Dharm Premi.

The followers of Bishkarman, a Brahman, who married a woman of another caste, are usually *Lohars* and *Tarkhans*. They have a temple of their own on the Phagwara-Nawanshahr road in the Jullundur District, but in practice they are Sanatan Dharmis.

Bishkarman. (Ludhiana, 29 males and 14 females.)

The founder of this sect is reported to be one Ram Pir, but the date of its origin is not traceable. Their particular beliefs and tenets are analogous to Hinduism. They pray like Hindus, and their religious books are in Shastri, Urdu or Gurmukhi. In their dress and mode of life they are just like other Hindus. They do not eat bacon and they bury their dead. Rama Pir's shrine is in the Jodhpur State, and a fair is held there during the months of *Bhadon* and *Magh* and draws thousands of members of this sect from the various parts of India.

Ram Shahi. (Bahawalpur State, 58 males and 45 females.)

Swami Bishan Dass, who is over 70 years old, is the founder of this sect. His disciples believe in the doctrines of the ten Gurus of Sikhs, and are also known as Nanak Panthis. The following places are held sacred by them :—

Gahhar Ghambir. (Ambala, 15 males and 22 females.)

(1) Rupar (Ambala District), (2) Sirhind Basi (Patiala State), (3) Machhiwara (Ludhiana District), (4) Badla (Patiala State), and (5) Chak No. 389 G. B. (Lyallpur District).

The name of this sect, which is one of the names of the Almighty, literally meaning "Deep, Profound," has been derived from a *shabad* (hymn) contained in the Granth Sahib (the holy book of Sikhs).

They are really Jhiwars, and the founder of the sect was Baba Kalu, a Jhiwar who lived in the time of Akbar the Great. The successor of Baba Kalu pays a half-yearly visit to the members of the sect, and gives them a *kanthi* (necklet) to wear. They have a temple in Bhalwal and another in Patangarh, both in Karnal District, and usually follow Hindu religion and observe the same fairs and festivals as other Hindus. Their peculiarity is a worship of wells.

Kanthiwal. (Karnal, 51 males and 42 females.)

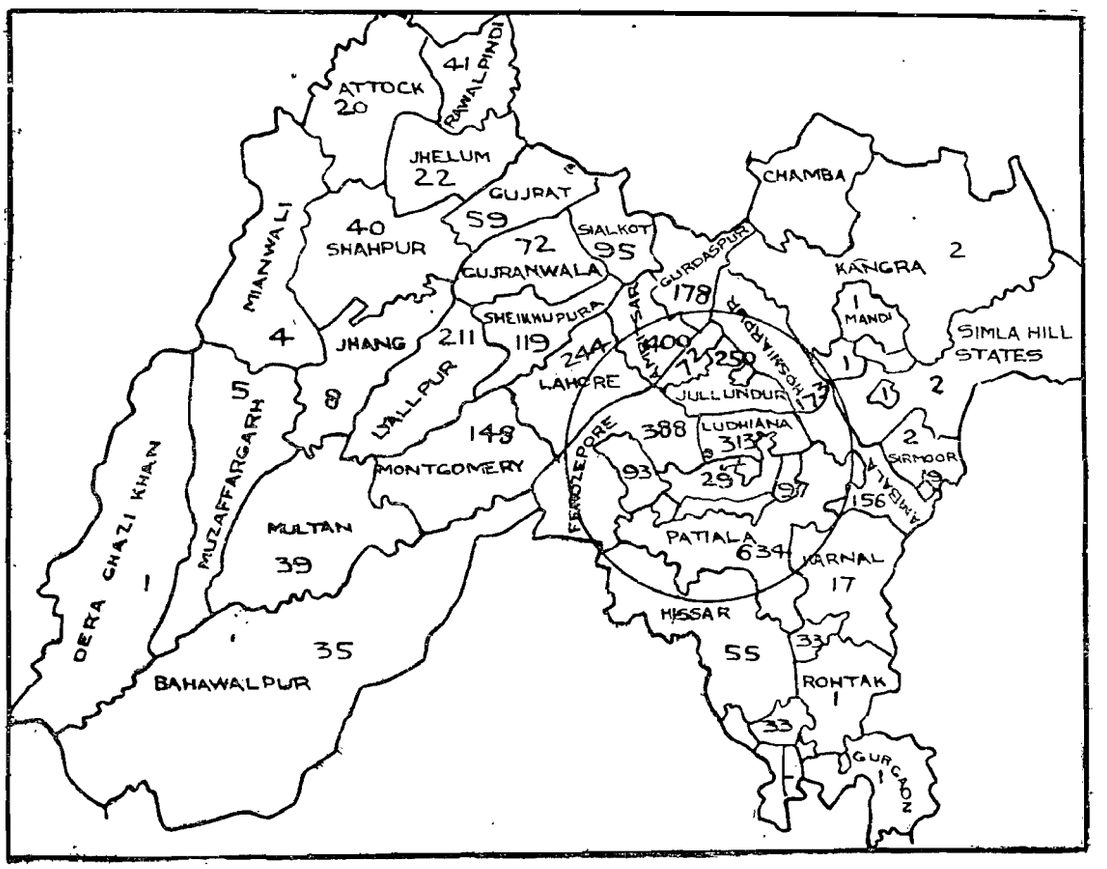

SECTION 3.—SIKHS.

231. The followers of Sikhism at the present census number 4,071,624, of whom 2,270,946 are males and 1,800,678 females, giving a proportion of 793 females per 1,000 males. During the last decade Sikhs have increased by 964,328 or by 31·1 per cent. The principal figures for important units are given in the margin. A glance at the Social Map in the beginning of this Report will show that Sikhs reside chiefly in the central Punjab, being most numerous in the territory which is marked

General.

Locality.	Absolute figures of Sikhs (1931). Persons.	Males.	Females.	Proportion of females per 1,000 males.
1	2	3	4	5
Punjab ..	*4,071,624*	*2,270,946*	*1,800,678*	*793*
British Territory ..	3,064,144	1,703,584	1,360,560	799
Punjab States Agency ..	996,626	561,238	435,388	776
Other Punjab States ..	10,854	6,124	4,730	772

out roughly by a circle in the map below.

Actual number of Sikhs in thousands—Census 1931.

This circle embraces among other tracts the *Majha,* which comprises the Kasur and Chunian Tahsils of Lahore District and the Tarn Taran and Amritsar Tahsils of Amritsar District. The predominantly Sikh tahsils of Garhshankar and Hoshiarpur in the Hoshiarpur District are also included, Una and Dasuya Tahsils with a smaller proportion of Sikhs being left out. Further south the Rupar sub-division of Ambala and parts of Kaithal sub-division and Thanesar Tahsil of Karnal District fall within it and also nearly the whole of the Patiala State and the major portion of the Sirsa Tahsil of Hissar District. The heart of the circle covers the whole of Ludhiana and Jullundur Districts, the States of Kapurthala, Maler Kotla, Faridkot and Nabha, and a considerable portion of the Ferozepore District. The figures of the Sikh population are given in the map in thousands for all districts and states. The Sikhs number approximately $2\frac{1}{2}$ millions within and $1\frac{1}{2}$ millions outside the circle, and their proportion diminishes with the distance from the circle.

Variation in Number of Sikhs at Past Censuses.

232. The population of Sikhs has been growing at each census except during the decade 1881—91, and in 1881 was considerably less than half of what it is now. The table in the margin shows their number, percentage increase and proportion per 10,000 of the total population at each of the past censuses. The numerical strength rose markedly during the decade 1901—11, but the increase during the last decade is unprecedented.

Census.	Absolute figures for Sikhs.	Percentage increase.	Proportion per 10,000.
1	2	3	4
1881 ..	1,706,909*	..	822
1891 ..	1,849,371*	8·4	809
1901 ..	2,102,813	13·7	863
1911 ..	2,881,495	37·0	1,211
1921 ..	3,107,296	7·8	1,238
1931 ..	4,071,624	31·0	1,429

* Include figures for Delhi.

Below are given some quotations from the Census Reports of the past, which graphically describe certain phases of the Sikh community bearing on the rise and fall in its population at various periods.

The following extracts appear at page 140 of the Punjab Census Report of 1881 :—

In 1853 Sir Richard Temple wrote, as Secretary to the Government :—

"The Sikh faith and ecclesiastical polity is rapidly going where the Sikh political ascendancy has already gone. Of the two elements in the old Khalsa, namely, the followers of Nanak the first prophet, and the followers of Guru Gobind, the second great religious leader, the former will hold their ground, and the latter will lose it. The Sikhs of Nanak, a comparatively small body of peaceful habits and old family, will perhaps cling to the faith of their fathers but the Sikhs of Gobind who are of more recent origin, who are more specially styled the Singhs or Lions, and who embraced the faith as being the religion of warfare and conquest, no longer regard the Khalsa now that the prestige has departed from it. These men joined in thousands, and they now depart in equal number. They rejoin the ranks of Hinduism whence they originally came and they bring up their children as Hindus. The sacred tank at Amritsar is less thronged than formerly, and the attendance at the annual festival is diminishing yearly. The initiatory ceremony for adult persons is now rarely performed."

In the Administration Report of 1856-57 the same writer says after speaking of the small number of Sikh recruits that offered themselves till the fall of Delhi proclaimed our triumph.

"Sikhism itself, too, which had previously fallen off so much, seems again to be slightly on the increase. During the past year the baptismal initiations at the Amritsar temple have been more numerous than during the preceding year. Sikhism is not dormant."

And Colonel MacMahon, Commissioner of Amritsar, writes as follows in his Census Report :—

"The large decrease in the number of Sikhs since 1868 is not surprising. Sikhs decline in number, in years of peace. There was a serious decline, I believe, after the conquest of the Punjab down to 1857, when the demand for Sikhs for our army during the mutiny for a time gave a great stimulus to the growth of Sikhism. The idea prevails, not only with the officers of native regiments, but also among the classes from which Sikh converts are obtained, that Sikhs made better soldiers than Punjabi Hindus; and hence whenever the warlike spirit revives, Sikhism in this part of the Punjab also revives. All the members of the same family do not always become Sikhs; and those who have acquired a taste for the soothing influence of tobacco abstain from taking the *pahul*. Hence in times of peace there is a tendency for Sikhism to decline."

The following passage occurs in the Punjab Census Report of 1891 (p. 96) :—

"There is reason to believe that the marked preference shown for Sikhs in many branches of Government service, the hardy nature of the castes from which they are mainly drawn, and the recent extension of a kind of patriotic antiquarianism among the more educated of them, has not been without its influence in strengthening their power and preventing the disruption of the Sikh community which one has so often seen predicted."

The next decade found the Sikh population rising at the expense of Hindus, and the following remarks are met with in the Punjab Census Report of 1901 (p. 122).

"The number of Sikhs in these Provinces,* according to the present returns, is 2,130,987 as against 1,870,481 in 1891, an increase of 260,506, or 13·9 per cent. If these figures are at all accurate, Sikhism has made a marked advance since 1891, possibly at the expense of Hinduism, for the Hindus only show an increase of 2·4 per cent."

The phenomenal increase continued even during the very unhealthy decade preceding the census of 1911, when the total population of the Province showed an actual decrease. After remarking about the absence of separate vital record for Sikhs, the 1911 Report with regard to the increase in their number said :—

"Nevertheless the rate of increase is much too high for the natural development of population, under the unhygienic conditions which prevailed during the decade. The gain seems to have occurred mainly by accretions from the Hindus. It has not been possible to ascertain the number of people who have taken the *pahul* during the last ten years, but the Singh Sabhas have been very active in enforcing the tenets of Guru Gobind Singh on all followers of Guru Nanak, whether Sikhs or Hindus, and they have been assisted greatly in their efforts by the fact that only *Keshdhari* Sikhs are enlisted in the army."

In the 1921 Report the following remarks of Mr. Garrett, I.E.S., who acted during a portion of the war period as a Recruiting officer, appear at page 179 :—

"My experience during 1917 and 1918 in Ludhiana and the adjacent territories was that there were a large number of families of the Hindu zamindar class, of which those members who had enlisted in the Army had, as a matter of course, become Sikhs. Those who in the ordinary course of events would have stayed at home did not do so. When, as a result of the intensive recruiting at the later stages of the War, the latter were induced to join up, they too became Sikhs."

* The area that now constitutes approximately the whole of the Punjab and N.W.F. Province.

Apart from the facts set forth in the extracts quoted above, the number of Sikhs since 1911 has greatly risen on account of the changed instructions about the definition of Sikhism. Prior to that year only those were recorded as Sikhs, who according to the tenets of the tenth Guru, Gobind Singh, grew long hair and abstained from smoking, but since then any one is recorded as a Sikh who returns himself as such whether or not he practises those tenets.

The Sect Table XVI-A printed in Part III of this Volume gives the numbers of Kesdharis or those who take *pahul* and wear *kes* (long hair), and Sehjdharis or those who do not take *pahul* or grow *kes*. These figures are for facility of reference reproduced in the margin for this as well as the last census.

Particulars. 1	Kesdhari. 2	Sehjdhari. 3	Unspecified. 4
1921 ..	2,873,788	228,366	5,142
1931 ..	3,588,829	281,903	200,892
Variation ..	715,041	53,537	195,750
Variation per cent ..	24·9	23·4	3,806·9

Sikh Growth due to Absorption of Hindus.

233. It is obvious from the remarks of the Census Reports of the past that the number of Sikhs varies greatly from time to time on account of the comparatively easy conversion from Hinduism. It is not essential for a Sikh to be born a Sikh and any one can be initiated into the religion by *pahul*, a process fully described in the Census Report of 1881 (p. 136). This view is borne out by the figures in the margin, which show the absolute increase at each census in the total number of Sikhs as well as the increase or decrease among Hindus. The figures of Sikhs have risen at each census while those of Hindus have shown a decrease at the censuses of 1911 and 1931. At both these censuses the decrease among Hindus was accompanied by a marked increase among Sikhs, though there were also other causes responsible for reduction in the Hindu population, such as plague during the decade, 1901—11, and the treatment of Ad-Dharm as a separate religion on the present occasion. The big rise in the Sikh population during the last decade is obviously not due to natural increase alone. If any fresh evidence on this point is needed, we have only to apply the test of survivorship to the Sikh population of 1921 and thus determine approximately the amount of gain due to the absorption of non-Sikh (primarily Hindu) population. From the figures in the margin we find that 542,596 persons were so absorbed. The calculations are based on the assumption that the proportion of survivors (persons now aged over 10 years) of the 1921 Sikh population would be the same as that for the total population. Any excess in the present Sikh population aged over 10 years would, therefore, be due to absorption from other communities as Sikhs are not likely to gain in numerical strength through any other cause, much less through immigration as among them the number of emigrants is larger than that of immigrants. The estimate of absorption

ABSOLUTE INCREASE OR DECREASE.

Total estimated absorption (by adding items 4 and 7).	..	542,596

in the population under 10 is made on the assumption that the children under 10 among Sikhs would bear the same ratio to the calculated surviving Sikh population, aged 10 years and over, as the children of all religions under 10 have to the total population aged over 10 years in 1931.

In the general remarks in the beginning of this Chapter it has been pointed out how certain castes were being more easily absorbed than others by Sikhism, and having regard to what has been said in this paragraph we can safely foretell that at no distant future most of the Hindu agricultural and artisan classes residing in the areas, included in the circle in the map on page 304 as the stronghold of Sikhs, will go over to Sikhism. The only castes of Hindus which stand firm are Brahman and Khatri, though many members of the latter have become Sikhs.

234. The map below shows the percentage of increase in the number of Sikhs in each district and state over the figures of the last census. **Percentage Increase of Sikhs in Smaller Units.**

Increase per cent. among Sikhs during 1921—31.

The high percentage of increase in the canal colonies is undoubtedly due both to inter-district migration and absorption of lower castes of Hinduism, while in places like Mianwali, Karnal and Sirmoor, where Sikh population is very meagre, the results are evidently due to mere absorption. In such places the percentage of increase does not truly represent any real increase. This applies even with greater force to places like Pataudi, Dujana and Loharu. In Ambala, Ludhiana, Amritsar, Lahore and Jullundur the increase is entirely due to accretions from other castes as well as to the large natural increase. In the Mandi State the increase has resulted from migration owing to the numerous labourers attracted by the Hydro-Electric project at Jogindarnagar. In certain districts Sikhs have actually decreased, but there is nothing surprising about this

as in districts such as Dera Ghazi Khan, Attock, Jhang, Rohtak and Gurgaon and Simla Hill States Sikhs are very few and the reduction in their number might be due to any cause, migration or absorption by Hinduism. It is on the whole noticeable from the map that Sikhs have in many areas increased at a much greater rate than the total population. The marginal table compares the increase per cent. among Sikhs with that among all religions in British districts.

To give some further idea about the gain of Sikhism I quote in the margin the figures of certain castes for 1921 and 1931. It may be pointed out that these figures furnish no more than a mere indication as except in the case of higher castes such as Jat and Rajput, converts to Sikhism do not as a rule return any caste, being content with the entry of 'Sikh' in the column of caste. This desire to return no caste is actuated by the feeling that it is better not to return a low caste, and as a matter of fact many members of low castes such as Chuhra and Chamar adopt Sikhism in order to escape the *inferiority complex*. In regard to Sikhs the instructions to enumerators were that they should not be pressed to return their caste.

The figures of variation in the numerical strength of castes can be best studied over a long period, as owing to wrong classification or different interpretation of instructions the results of two successive censuses may not serve as an index to actual facts. The table below shows for each of the last six censuses the variations in the population figures of certain castes, which claim both Hindus and Sikhs among their members.

Caste and religion.	1881.	1891.	1901.	1911.	1921.	1931.

" (Sikh) ..	100,014	106,328	75,753	164,110	161,862	155,717

The figures bear out the remarks recorded above. Among Jats the number of Hindus has gone on decreasing since 1901, except for a small

SECTION 4.—AD-DHARMIS.

General.

236. The circumstances leading to the return of Ad-Dharmi religion have been described in the general section of this Chapter. The figures of Ad-Dharmis for certain districts have been given in paragraph 219 above. The absolute figures by districts and states are given in Imperial Table XVI and the figures by tahsils in Provincial Table II, both appearing in Part II of this Volume. The Ad-Dharmis, however, do not comprise all the Hindu depressed classes as numerous members of these classes have returned themselves as Hindus and abstained from claiming the new religion. The figures for all the depressed classes of Hindus are not available, as at this census some limit had to be placed for reasons of economy on the number of castes to be sorted. The figures for the most numerous castes are, however, available, and the total strength of depressed classes belonging to these castes inclusive of Ad-Dharmis is given in Appendix I at the end of this Chapter. The table in the margin gives the figures of Ad-Dharmis and the Hindu depressed classes* separately as far as available for each district and state. It is evident from the table that Ad-Dharmis in most places form only a fraction of the Hindu depressed classes, and except in Jullundur and Hoshiarpur, which are their strongholds, and Sheikhupura and Lyallpur colonies, Ad-Dharmis nowhere outnumber the other depressed classes. In Montgomery the number of the two is about equal. It is obvious, therefore, that the number of persons who returned themselves as Ad-Dharmis in each area was governed by the peculiar circumstances of the locality. In areas like Hissar, Rohtak and Karnal, where depressed classes are found in large numbers, the propaganda on behalf of Ad-Dharmis appears to have been ineffective as these districts are far removed from the centre of Ad-Dharmi movement. Moreover, the Hindu land-owning classes of those tracts wield a strong influence against religious disruption. The number of Ad-Dharmis on the other hand is large in the colony districts, where menial classes are fully alive to their interests. A lot of propaganda work was done by the leaders of Ad-Dharmis, specially in the Lyallpur District. At the same time the Sikh land-owners in some districts, particularly Lyallpur, Ludhiana and Ambala, used all their resource to make Chuhras and Chamars return themselves as Sikhs and not as Ad-Dharmis, and but for this the number of Ad-Dharmis in those districts would have been considerably larger.

* Bawaria, Chamar, Chuhra, Dagi and Koli, Dumna, Magh, Od, Ramdasia, Sansi and Sarera.

In the margin are given figures since 1881 for some of the most numerous depressed classes, who have been returned as belonging to more than one religion. The Bawarias at the present moment are equally divided between Hindus and Sikhs, while most of the Sansis returned their religion as Sansi but were thrown into the Hindu religion at the time of sorting. The proportion of Chamars in the Ad-Dharmi figures is very much greater than that of Chuhras. The fickleness of both in the matter of faith is, however, well illustrated by their oscillation between Hinduism and Sikhism at different censuses. A considerable number of Ramdasias, who would have otherwise returned themselves as Sikhs, returned themselves as Ad-Dharmis at this census. A further discussion on the subject of depressed classes will be found in Appendix III at the end of this volume.

SECTION 5.—MUSLIMS.

General.

237. The Muslims according to the present census number 13,332,460 (7,241,612 males and 6,090,848 females) in British Territory, as against 11,444,321 (6,195,738 males and 5,248,583 females) in 1921, which means an increase of 16·5 per cent. In the Punjab States their number is 1,597,436 (874,771 males and 722,665 females) as against 1,369,062 (751,819 males and 617,243 females) at last census, or an increase of 16·7 per cent. The proportion of Muslims in British Territory and Punjab States to the total population is 56·5 per cent. and 32·5 per cent., respectively, while in the Province it is 52 per cent. The Muslim population has never shown a decrease at any of the past censuses. During the last fifty years their proportion in the total population has risen from 48 to 52 per cent. indicating that the increase among them has been at a greater rate than that among the rest of the population.

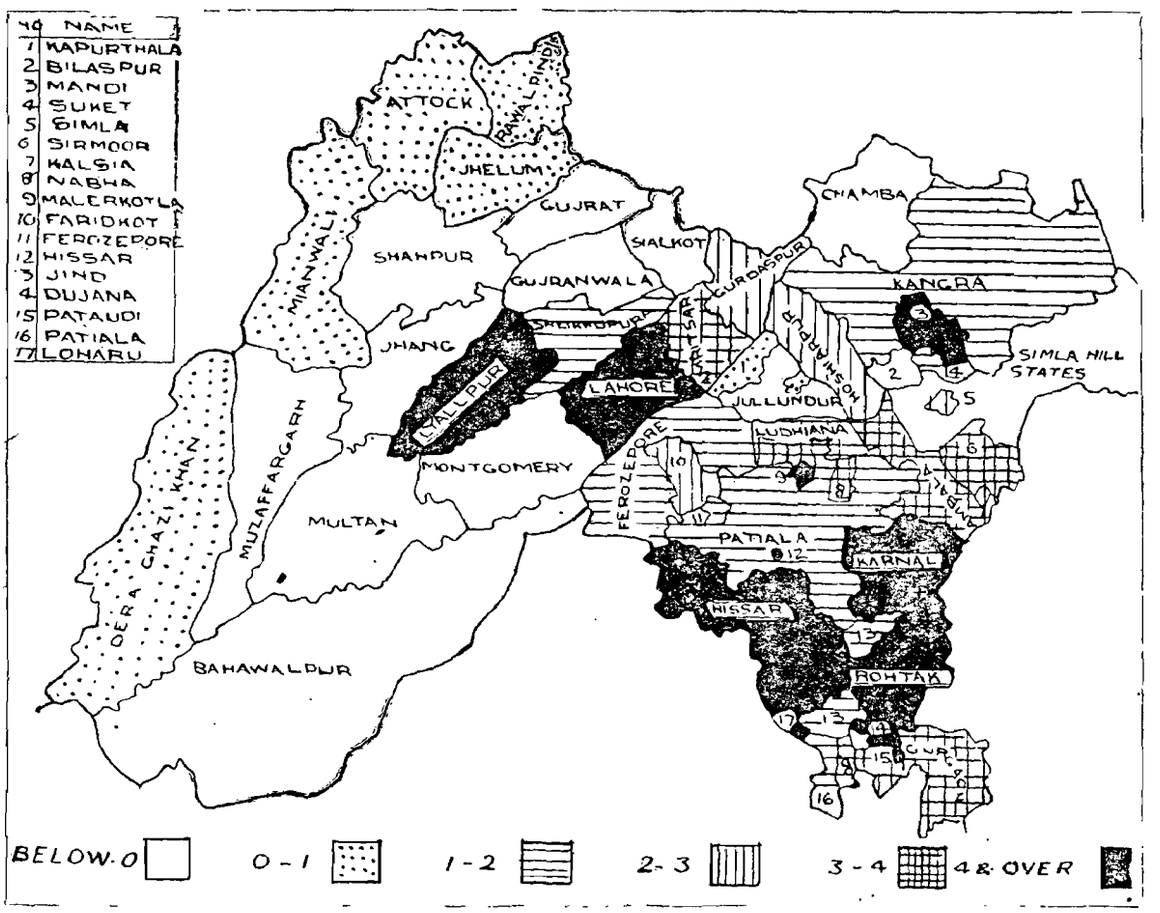

The map below shows the percentage of variation in each district and state since 1921.

Increase percentage in Muslim population 1921—1930.

The increase is greatest in Montgomery District, but here the total population has also increased by over 40 per cent. The same is the case with Multan and Bahawalpur where the percentage increase is next highest. The increase in Sheikhupura, Lyallpur, Lahore and Amritsar has been fairly big. Hissar, Ludhiana, Gujranwala, Jhang and Mianwali come next, followed by the north-western districts of Gujrat, Shahpur, Jhelum, Rawalpindi and Attock, the south-eastern districts of Gurgaon, Rohtak and Karnal, and Ambala and Hoshiarpur. There has been only a small increase in Dera Ghazi Khan, Kangra and Bilaspur, and the least in Muzaffargarh and the rest of the Himalayan Natural Division.

The map below shows at a glance the difference between the

Excess of percentage increase among Muslims over the percentage increase in the total population 1921—1931.

percentages of increase among Muslims and the total population of each district and state.* In the greater portion of North West Dry Area the rise among Muslims has been smaller than that in the total population. This is true of Montgomery, Multan, Bahawalpur, Muzaffargarh, Shahpur and Gujranwala. The same applies to the sub-montane districts of Gujrat and Sialkot and the Indo-Gangetic Plain district of Jullundur. The slightly greater increase in the extreme western districts, from Rawalpindi to Dera Ghazi Khan, is only 1 per cent. above the increase in the total population. The only other people of this part of the Province are Hindu traders who do not show the same increase, as the Muslim gain is in some of these districts no doubt partly due to the demobilization of a considerable number of Muslim soldiers during the last decade. The

*The figures of total population for 1921 for this map and the map on the last page have been taken from Imperial Table II, which gives adjusted figures after accounting for changes in area ; the figures of Muslims, taken from Imperial Table VI of 1921, have not been similarly adjusted except in Sheikhupura where alone the transfer of area and population was considerable. The population of Muslims in this district for 1921 has been estimated to be 204,256 males and 164,431 females.

next higher rise is in Sheikhupura, Ferozepore, Patiala and Jind. The increase in the first-named is partly due to the immigration of tenants, field labourers, etc., which is still going on from districts such as Jullundur and Sialkot. The increase in Lyallpur is due to the recent extension of colonization, and in Lahore to natural causes and immigration to the city. The higher percentage increase in south-eastern districts is due to comparatively smaller increase in the rural population which is predominantly Hindu owing to the increasing pressure on resources or unhealthiness. The large percentage increase in Mandi is of course mainly due to the influx of labourers at Jogindarnagar.

The increase among Muslims has been examined above in more ways than one. Two important causes, which have apparently contributed to a proportionately greater rise in their population in the past, are the comparative healthiness of the tracts in which the bulk of their population resides, and the great economic development which has taken place in those areas.

Muslim Sects.

238. The sects of Muslims have been grouped in Table XVI-A (in Part III of this Volume) under four main heads, *viz.* (1) Shias, (2) Sunnis (3) Reformers and (4) "Sects analogous to other religions."

The provincial figures are given in the margin for facility of reference. It will be seen that over 95 per cent. of the Muslim population in the whole Province is Sunni, and more than half of the remainder is Shia. The group 'Reformers' forms only 1·6 per cent. of the total, *Ahmadis* and *Ahl-i-Hadis* being ·4 and 1·2 per cent., respectively.

Sects.	Strength.	Sects.	Strength.
1	2	1	2
Shia ..	338,779	Reformers ..	241,418
Sunni ..	14,276,642	Ahl-i-Quran ..	440
Hanfi ..	24,289	Ahmadi ..	55,908
Miscellaneous ..	697	Ahl-i-Hadis ..	182,544
Qadri ..	123	Mawahid ..	896
Shafi ..	1,230	Sects analogous to other religions ..	1,630
Unspecified ..	14,250,303	Sects Unspecified ..	73,057

Variation.

The figures for the main sects are compared in the margin for the censuses of 1921 and 1931. It is evident that the proportionate increase among Sunnis is about the same as that in the total population. The Shias have increased by 32 per cent., while Ahmadis have nearly doubled and Ahl-i-Hadis trebled during the last decade. Sects analogous to other religions show an increase, but their figure is negligible.

Sects.	1921.	1931.	Increase.
1	2	3	4
All Sects ..	*12,813,383*	*14,929,896*	*16·5*
Sunnis ..	12,466,791	14,276,642	14·5
Shias ..	256,629	338,779	32·0
Ahl-i-Hadis ..	60,327	182,544	202·6
Ahmadi ..	28,816	55,908	94·0

SECTION 6.—CHRISTIANS.

General.

239. The total number of Christians in the Province is 419,353 as against 332,939 at last census, an increase of 26 per cent. Of these, Europeans and allied races number 20,099 or 4·8 per cent., Anglo-Indians 3,625 or 0·9 per cent., and Indian Christians 395,629 or 94·3 per cent. Europeans and Anglo-Indians have decreased during the last decade by 8·4 and 19·4 per cent., respectively, while Indian Christians show an increase of 29 per cent., a rate only exceeded by the percentage of rise among Sikhs. The causes of variation are discussed in paragraph 315 of the next Chapter on Castes, Tribes and Races.

Castes of Females.

249. The following instructions, as in 1921, about the return of castes by women were issued :—

"Women—The caste of an unmarried girl will be the same as that of her father. In respect of a married woman the entry should be as stated by her husband. No enquiries should be made as to the caste or tribe of a married woman before her marriage. Her present caste or tribe should be asked and the answer taken down without question. Among Hindus the caste of a woman will be that of her husband. But among Muslims the husband may in some cases like to have one of his wives put down as Pathani, the other as Jatti, and a third as Bilochni."

Origin of the Caste System.

250. The subject of castes, their origin and comparative social status, has been fully discussed in the previous Census Reports of this Province. Sir Denzil Ibbetson's Caste Chapter in the 1881 Report is still regarded as the main authority on the subject, and notable additions to the study of the subject were made by his successor of the 1901 census, Mr. Rose, who dealt with the subject from a new point of view. No complete study of variation in the number of persons belonging to different castes and tribes observable from census to census is possible except with the help of the explanations given in the various Census Reports. At this census we have prepared Table XVIII which compares the strength of the castes and tribes, for which figures were available on the present occasion, with the corresponding figures of all the past censuses. This Table appears in Part II of this Volume and the figures therein are given as far as possible for the localities where any considerable number of persons belonging to a caste or tribe reside. The variation from census to census as well as the net variation from 1891 to the present census has been given by religion and wherever possible by sex. For the purposes of this Table the Punjab has been split up into four main divisions described below :—

A.—Eastern Punjab, including the Ambala Division except Simla District and the States of Loharu, Dujana, Pataudi, Kalsia and Sirmoor.

B.—Central Punjab, Hills, including the Simla and Kangra Districts, the Simla Hill States and the States of Bilaspur, Mandi, Suket and Chamba.

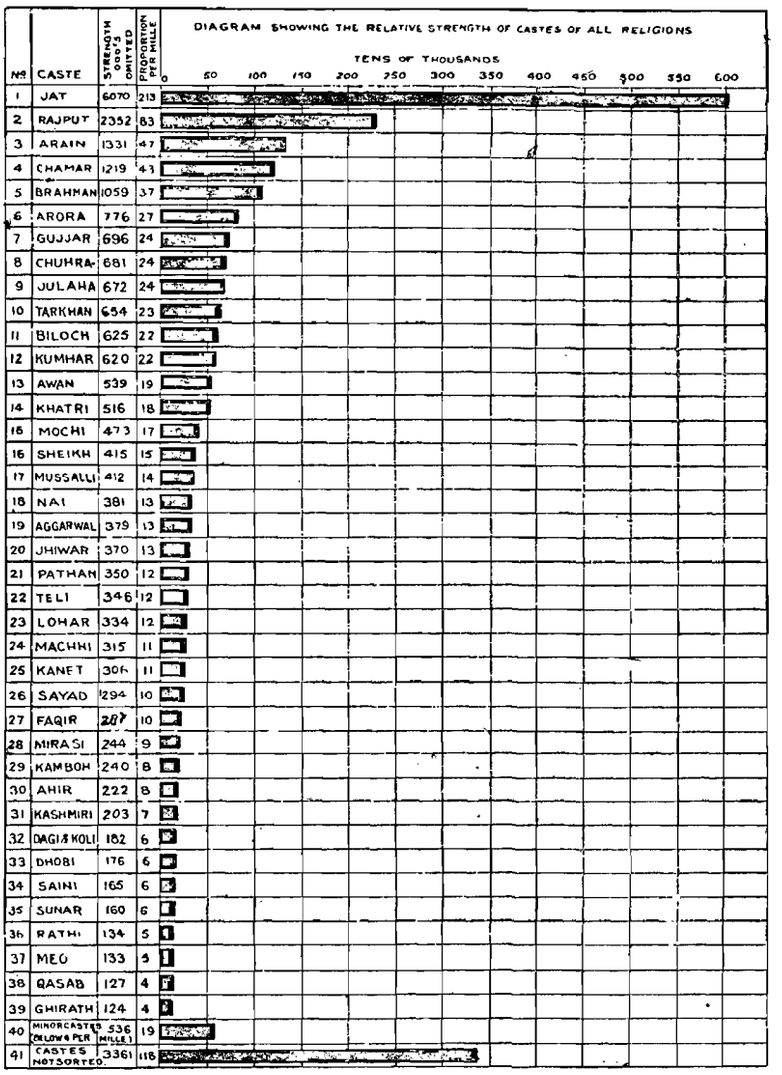

C.—Central Punjab, Plains, including the Jullundur Division except Kangra District, Lahore Division, the Gujrat, Lyallpur and Jhang Districts, the Phulkian States, and the States of Kapurthala, Faridkot and Maler Kotla.

D.—Western Punjab, including the remaining districts in the Rawalpindi and Multan Divisions and the State of Bahawalpur.

A reference will frequently be made to these Divisions as we examine the strength of castes, tribes and races in subsequent paragraphs. A subsidiary table similar to Table XVIII showing the total strength and percentage variation in each caste is printed for facility of reference at the end of this Chapter. The facts and figures, discussed in this Chapter, should furnish valuable information about the modern tendencies of the caste system. Into the subject of the origin of the caste system or an explanation as to the comparative social status of the various castes I need not enter. Ample material is available on the subject of the origin of caste system in Sir Denzil Ibbetson's Census Report and Sir Herbert Risley's 1901 India Report as well as in books such as Emile Senart's " Caste System." Regarding the comparative social status of castes Sir Denzil Ibbetson's " Castes of the Punjab " and Mr. Rose's " Glossary of the Tribes and Castes of the Punjab " contain a wealth of detail never again collected. I shall, therefore, confine myself to an explanation of the 1931 returns and their significance. It may be useful to mention that the present figures of castes have been compiled with the aid of an index supplemented at past censuses, which has helped considerably to classify doubtful entries on old lines. Figures returned under synonymous names have as usual been grouped together, *e.g.*, the figures for the caste *'Chuhra'* include those for *Bhangi, Khakrob, Mehtar, Halal-khor*, etc., which are the different names by which the caste is known in different localities.

Present Numerical Strength of Castes and Tribes.

251. An idea of the comparative strength of different castes can be formed from the diagram in the margin, which shows by the length of the black rectangles the strength of each caste in the Province, and also gives for each caste the absolute strength and the proportion *per mille* of the total population. The results shown in this diagram donot reveal any radical change, resulting from the social upheaval and the desire of members of certain castes to return a higher caste. A real change would come about if a large section of the people cease to claim caste altogether.

Important Castes.

252. The most numerous caste in the Punjab, as before, is Jat with a total strength of over 6 millions and a proportion of 213 *per mille* of the total population. Rajputs have the next highest proportion of 83 *per mille*, followed by Arains who are 47 *per mille*. All the castes, sorted on the present occasion, whose traditional occupation is agriculture, including Gujjars who are mainly agriculturists, form 451 *per mille* of the total population. It is perhaps needless to add that all members of the castes with agriculture as their traditional occupation do not engage in agriculture, while a large majority of the members of some other castes, notably Brahman, Biloch, Sayad and Moghal (not tabulated), and many members of occupational castes such as Tarkhan, Lohar and Kumhar engage in agriculture. A considerable number of Chamars, Chuhras and Mussallis are agricultural labourers. The proportion of purely agricultural castes classed as such at each of the last three censuses out of the total population is given in the margin. The proportion for the present census is low, mainly because all the castes have not been sorted. If all the statutory agricultural castes, treated as such in the Financial Commissioners' Standing Order No. 1, were sorted they would probably constitute more than half the total population of the Province.

Agricultural Castes.	1931.	1921.	1911.
Proportion per cent. of the population ..	42·7	45·4	44·1

Coming to the trading classes we find that Aroras are the most numerous forming 27 *per mille* of the total population, while Khatris come next with a proportion of 18 *per mille*, and Sheikhs and Aggarwals have a proportion of 15 and 13 *per mille*, respectively.

The next most numerous classes are the artisans, prominent among whom are Tarkhans with a proportion of 23 *per mille* and Lohars with a proportion of 12 *per mille* of the total population. The figures for Ramgarhias, who are mainly Tarkhans, Lohars and masons and are tending to form a separate group, were not sorted on the present occasion. Julahas have a proportion of 24 *per mille*. Kashmiris 7 *per mille*, Teli 12 *per mille*, Machhi 11 *per mille*, Jhiwar 10 *per mille*, and Chhimbas and Dhobis together 9 *per mille*. Of the lower menials, Chamars including Ramdasias constitute 24 *per mille* and Mochi 17 *per mille*, while Chuhras and Mussallis are 24 and 14 *per mille*, respectively.

The two castes which cater to the rich or the well-to-do, namely, Sunar and Qasab, number only 7 and 4 *per mille* of the total population, respectively. Of the classes who live by services commonly termed *birt* or *sep* the Nai constitute 17 *per mille* and Mirasi 9 *per mille*.

Variation in Caste Figures During Last Decade.

253. The figures quoted above reveal that the social structure of the population is much the same as before in spite of the new influences. Some castes and tribes, however, show a great variation, particularly in certain localities. The table below shows the percentage variation since 1921 in the number of each caste and tribe tabulated by religion in the Province as a whole. In order to explain these variations I propose to take up each caste or tribe in the alphabetical order, in which it appears in Imperial Table XVII.

Percentage variation in selected castes by Religion based on Imperial Tables ***XVII*** *1931 and* ***XIII*** *1921.*

* Hindu. † Jain.

259. The Bagaria has been shown as a separate caste since 1911. It is returned chiefly from Ferozepore (8,467), Bahawalpur (5,971) and Hissar (4,061), the total number in the Province amounting to 32,527. Bagarias are immigrants from Bagar or the country lying to the south of Loharu, Hissar and Ferozepore, and are chiefly labourers engaged in earth-work on canals or buildings. **Bagaria.**

260. Of the 32,527 Bawarias, enumerated in the Punjab at this census, practically all are either Hindus or Sikhs, the number being almost equally divided between the two communities. At last census there were 26,000 Hindu Bawarias and only 9,000 Sikh Bawarias. There is a decrease among Bawarias which is particularly noticeable in Ludhiana and Ferozepore, mainly due to the fact that at this census Bawarias have in large numbers returned themselves as Sikhs without stating their caste. This view is corroborated by occupational figures (in Table XI) which show a decrease among cultivators, field-labourers and cattle-breeders, public force (village *chaukidars* mostly), learned professions and those living on their income, as only the well-to-do among Bawarias would care to return no caste. **Bawaria.**

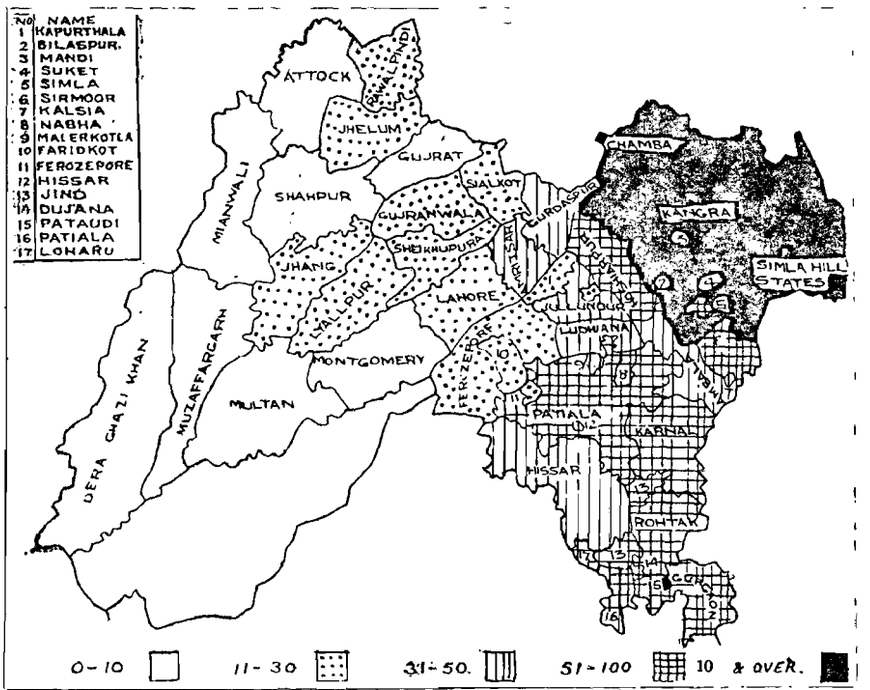

261. The Biloches have increased from 531,381 to 624,695 or by 17·6 per cent. The figures for the districts and states having the largest number together with the percentage increase are given in the margin. The increase among the Biloches is usually greater than the total increase among Muslims. The increase in Dera Ghazi Khan and Muzaffargarh, the home districts of the tribe, is much higher than in the total population of these districts and may be due partly to a claim of Biloch status by some members of certain other tribes. The Biloch is a most respectable tribe in Dera Ghazi Khan, but is anything but respectable in Karnal, while in all the other districts most of the Muslim camel-drivers, whatever their original caste may be, are almost invariably designated as Biloch. **Biloch.**

District or State.	Total strength in 1931.	Variation per cent. 1921—1931.
1	2	3
Dera Ghazi Khan	223,592	11·1
Muzaffargarh	121,300	11·9
Bahawalpur	87,768	20·4
Multan	43,068	40·8
Montgomery	32,095	48·3
Lyallpur	26,079	35·0
Jhang	24,498	20·3
Shahpur	19,241	18·3
Mianwali	18,245	16·6

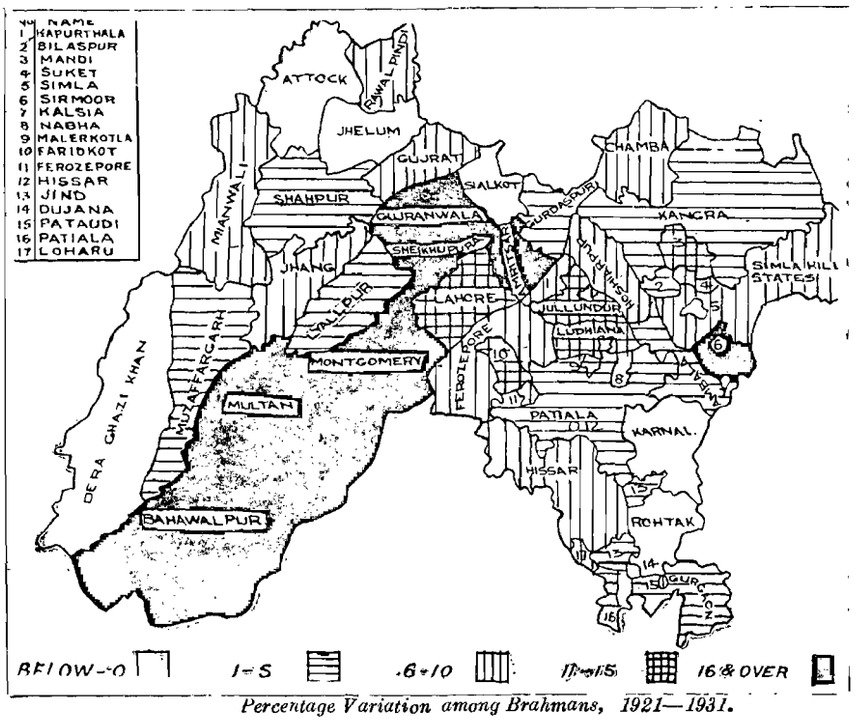

Turning to the occupations we find that there is an increase of 9,153 male and 1,566 female workers in the traditional occupation of camel-driving. There is also an increase of 5,434 or 5·2 per cent. in 'agriculturists' of all kinds, and of 2,898 or 39 per cent. among 'breeders of animals.' Artisans show a decrease of 1,056 or 20·2 per cent., trade of 421 or 48·9 per cent., Gazetted officers in Public Administration of 29 or 181·3 per cent., and Arts and Professions of 688 or 68·3 per cent. Very few Biloch women seem to work, there being only 45 female workers per 1,000 male workers as compared to 165 per 1,000 in the total workers of the Province according to Table X.

Brahman.

262. The total number of Brahmans in the Province is 581,045 males and 477,553 females, the intercensal increase among them being 5·8 and 6·5 per cent., respectively, as compared with a decrease of 2·3 per cent. in the total Hindu population. The difficulties of classification are particularly great as among Brahmans there are thousands of sub-castes and *gots*, which are returned as castes. The map in the margin shows the proportion of Brahmans in the total population in each district and state. The Himalayan Natural Division and the south-eastern districts having a preponderance of Hindu population are the home of Brahmans. Their strength in the central districts is not inconsiderable, but is very small in the predominantly Muslim districts in the north and south-west. The map in the margin shows the increase per cent. in the strength of Brahmans in each district and state during the last decade. The rise per cent. is highest in colony districts and Sirmoor State though the intrinsic figures are small. The only increase, which seems erroneous, is to be found among Brahman males of Amritsar amounting to 4,692 or 24·9 per cent., a percentage several times higher than that for Brahmans in Kangra District, which is one of their strongholds. There is a decrease in the number of Brahmans in Rohtak, Karnal, Simla, Jhelum, Attock and Dera Ghazi Khan. Brahman females have increased in Lyallpur by 738 or 17·6 per cent., apparently due to the permanent nature of immigration.

Number of Brahmans per mille of the Population 1931.

Percentage Variation among Brahmans, 1921—1931.

There is a decrease of 14,997 males and 7,174 females under the traditional occupation of priesthood which still claims 118 *per mille* of Brahman workers, indicating that priesthood now provides livelihood on a restricted scale. The number engaged in agriculture, which gives employment to 321 *per mille* of total Brahman workers, is now less by 18·6 per cent. There is an increase of 1,068 or 13·8 per cent. among artisans, which may be due to the inclusion (of course contrary to instructions) of some of the Dhiman or Jangida Brahmans, usually carpenters, a number of whom might have succeeded in returning themselves as Brahmans pure and simple as in 1911.* The instructions were to record both Dhiman Brahman and Jangida Brahman as distinct castes, though the latter was not eventually tabulated.

The Hindu Brahmans show a large increase in trade, there being now 39,343 workers as against 32,604 in 1921, an increase of 20·7 per cent. The increase under Arts and Professions amounts to 4,924 or 71·8 per cent., and the number of persons living on their income has also risen by 265 or 13·7 per cent. There is a decrease in Public Force and among beggars.

Chamars including Ramdasias and Hindu Mochis.

263. The Chamars and Ramdasias have been shown separately in Table XVII, but had better be discussed here together. Ramdasias have been excluded from Table VIII (Civil Condition by Age for Selected Castes), XI (Occupation of Selected Castes, Tribes or Races), XIV (Literacy by Selected Castes, Tribes or Races) and XVIII (Variation of Population of Selected Tribes), but it will certainly be an advantage to include them in those tables at the next census. Chamars and Ramdasias taken together number 1,236,943 or 8 per cent. more than in 1921. The distribution of Chamars and Mochis between the Hindu and Sikh religions in 1921 and among Hindus, Sikhs and Ad-Dharmis in 1931 is given in the margin. The figures of Chamars inclusive of Ramdasias and Mochis for the last six censuses are also reproduced in the margin from Table XVIII. It is evident that there is a large decrease among Hindu Chamars since 1921, mainly due to more than a quarter of a million of them having returned their religion as Ad-Dharmi. At the same time Chamars did not show in the past the same rapid increase as some other tribes. Assuming that Chamars including kindred castes have increased since 1881 at the same rate as the total population of the Province, and there is no reason why they should have not, there would now be 1,689,966 Chamars or 56,414 more than actually returned. The difference indicates the extent to

Chamar including Ramdasia and Hindu Mochi.

*Punjab Census Report, 1911, p. 393.

of Sikh Jats even in 1881. The almost complete disappearance of Hindu Jats in Ludhiana and Gurdaspur has occurred during the last fifty years, while in Maler Kotla and Faridkot the figures of Hindu and Sikh Jats fluctuated violently between 1881 and 1901, and during the last thirty years Hindu Jats have almost entirely disappeared owing to conversion to Sikhism. The moral is obvious enough and the extent of change from Hinduism to Sikhism is to be gauged from the amount of Sikh influence in each locality. This transition seems by no means to have come to an end, and the Hindu Jat is, I think, likely to be completely replaced by the Sikh Jat except in the south-east of the Province.

277. For the reasons explained in the Chapter on Religion, the number of Sikhs in the Province had, for a considerable period following the British occupation, been on the decline. The strength of Sikh Jats, who are the backbone of the community, had also been reduced accordingly. Sikhism has, however, regained its strength with the lapse of time, and its process of absorption continues. The total increase among Sikh Jats can be gauged from the table in the preceding paragraph, which shows that during the last fifty years Hindu Jats have decreased by nearly half a million, while Sikh Jats have risen by more than a million. In the central Punjab, particularly in Hoshiarpur and Jullundur Districts, several reasons can be assigned for the conversion of Hindu Jats to Sikhism. The foremost of these is the intensive campaign of religious preaching (*parchar*), carried on by the Akalis during the last decade. At the time of the census considerable propaganda was carried on by the Akalis, who went round the villages of Hindu Jats and induced them to return themselves as Sikhs. My inquiries show that the propaganda was successful in many villages. Very few of the Hindu Jats of the two Districts mentioned above are in the Army, and it is considered easy by a Jat to get himself enrolled as a soldier if he offers himself as Sikh Jat. For this reason also the tendency to go over to Sikhism has gained ground. Numerous Khalsa schools have been established in rural areas during the last decade, and the children of Hindu Jats, who form a small minority in these schools, do not feel very happy and so in many cases their parents give them *pahol* and convert them to Sikhism. It may be said here that a Hindu Jat of the *Doab* districts has no scruples whatever in converting his children to Sikhism while he himself remains a Hindu. Another circumstance worth mentioning is that Sikh Jats during the last decade, mainly owing to the Akali movement, have developed a prejudice against giving their daughters in marriage to Hindu Jats; formerly inter-marriages between Hindu and Sikh Jats were of common occurrence. This has also served as an incentive for many Hindu Jats to adopt Sikhism. The figures for some other districts given in the margin will, I think, be of considerable interest in this connection, though the increase is not in all cases due to conversion from Hinduism. The number of Sikh Jats in districts, such as Rohtak, Gurgaon, Simla, Jhelum, Rawalpindi, Attock, Mianwali, Jhang, Muzaffargarh and Dera Ghazi Khan, is very small indeed, and most of the Sikhs enumerated there are Khatris, Aroras or artisans.

Muslim Jat.

278. The Muslim Jats are the most numerous of all the Jats, numbering 2,941,395 (1,604,628 males and 1,336,767 females). The total figures and variations sicce 1881 are compared below with those of Hindu and Sikh Jats. The figures are given for the Province, British Territory and its administrative divisions, and Punjab States.

The increase per cent. during the last fifty years among Muslim and Sikh Jats is almost equal, while among Hindu Jats there has been a decrease of about 400,000 or 31·2 per cent. in British Territory. The home of Muslim Jats is the Western Punjab, while in the Ambala Division their number is very small and it has slightly decreased during the last decade. In the Jullundur Division the smaller increase is attributable to emigration to the colonies. The increase in the other Divisions is enormous, particularly in the Rawalpindi and Multan Divisions. For variations among the figures of Muslim Jats, which are due considerably to inclusion of other castes, the paragraph on Rajputs may be referred to.

Proportion of workers among Jats.

279. Coming to the changes in the occupations followed by Jats we find that among Hindus there are now 3,777 more male and 101,706 more female workers as compared to 1921. This is indeed remarkable. The proportion of female workers per 1,000 males was 132 in 1921 and is 422 now, as compared to 41 and 54, respectively, among Sikh Jats. Absolute figures of workers among Hindu, Sikh and Muslim Jats for the two censuses are noted in the margin. The total figures of Muslim and Sikh Jats show an increase in all occupations (see Table XI of 1931 and XXI of 1921.) The Jats receive

Jats (workers, *i.e.* earners plus working dependants)	*1931.*	*1921.*
1	2	3
HINDU Males ..	349,179	345,402
HINDU Females ..	147,425	45,719
SIKH Males ..	750,181	635,791
SIKH Females ..	40,262	26,114
Muslim Males ..	914,387	784,056
Muslim Females ..	55,739	35,150

accretions from other castes and tribes, but as only the selected castes were sorted the sources of absorption are not known. According to Appendix II at the end of this Chapter 18,373 persons belonging to some of the selected castes have returned themselves as Jats. In their case traditional castes were also recorded, and it was therefore possible to classify them.

Jhiwar.

280. The figures of Jhiwars and Kahars in the case of Hindus are best studied together. Kahars are tabulated separately for the first time on the present occasion, the figures of the two being lumped together in Table XVIII.

Hindu.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Jhiwars and Kahars..	258,507	275,252	281,591	213,212	215,210	186,673

From the marginal figures it will be seen that Hindu Jhiwars and Kahars have been on the decrease since 1901, mainly due to a certain number of them returning a higher caste, such as Mehra, Mehra Rajput. At this census 11,520 Hindu Jhiwars have returned other castes, chiefly Rajput. The instructions were that the traditional caste should also be recorded by the enumerator within brackets after the caste claimed, and Jhiwars claiming Rajput status have been included among Jhiwars. There might be more who returned no caste or returned a higher caste without revealing the traditional caste. For the castes claimed by Jhiwars a reference may be made to Appendix II.

As regards Muslim Jhiwars, their figures should be studied along with Muslim Kahars and Machhis, with whom they often get intermingled. The total figures are given in the margin for the six censuses along with separate details for each class. Among Muslims this class has steadily risen except during 1901-11. The Machhis have gained at the expense of Jhiwars, but very few seem to have claimed a higher caste.

Muslim.	1881.	1891.	1901.	1911.	1921.	1931.

Julaha.

281. The Hindu and Sikh Julahas have decreased during the last decade from 58,575 and 5,632 to 53,488 and 5,449, respectively. The decrease may be due to the return of no caste or a caste under a different name such as Koli. The variations since 1881 are given in the margin, the figures for Muslim Julahas being also quoted. Muslim Julahas have shown a considerable increase throughout except at the census of 1911 when the total population also showed a decline. Among Muslims 151,321 or 78·1 per cent. of workers, among Hindus 6,252 or 13·9 per cent., and among Sikhs 299 or 37·6 per cent. are engaged in the traditional occupation of weaving. Among Hindus the percentage is smallest and the desire to discard caste proportionately greater. The number of literates in the three communities is 19, 14 and 70 *per mille* of the population aged 7 years and over, respectively. At this census 16,511 Julahas claimed some other castes, mainly Rajput.

Kahar.

282. See paragraph dealing with Jhiwars.

Kamboh.

283. The total number of Hindu, Sikh and Muslim Kambohs is given in the margin for the six censuses. The interchange between the Hindu and Sikh Kambohs and the consequent large increase among the latter are at once noticeable, while Muslim Kambohs have also largely increased. The caste being particularly industrious and of good standing in many localities shows a tendency to expand. Muslim Kambohs show a decrease in Gujrat and Sialkot. In the former district they have mostly returned themselves as Arains, while in the latter the decrease is due to many Kambohs having left the district on being allotted colony land in Sheikhupura. The most remarkable feature about Kambohs, indicated by the marginal table, is their great expansion in colony districts as compared with their home districts. The figures are typical of the migration of large tribes from one area to another in recent times, a practice which seems according to tradition to have been fairly common in a remote past.

Kashmiri.

284. The Kashmiri has always been tabulated as a caste though it is really a nationality. The instructions were that Kashmiri was not really the name of a caste, but if a person could give no other caste he should be recorded as Kashmiri. Kashmiri Hindus are as a rule Brahmans. In the census tables Kashmiri has always appeared as a separate caste, almost all the persons returned as such being Muslims. Kashmiris are found spread over the central Punjab fairly evenly. The figures in the margin show their total strength in the Province for the last six censuses. The increase since 1921 amounts to 33 per cent., which is mainly due to the fact that at this census, which was held in the end of February, about three weeks earlier than in 1921, all the periodic migrants from Kashmir, who usually return home in March, were still in this Province.

Caste.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Kashmiri Muslims..	149,623	140,555	189,696	174,812	166,340	199,040

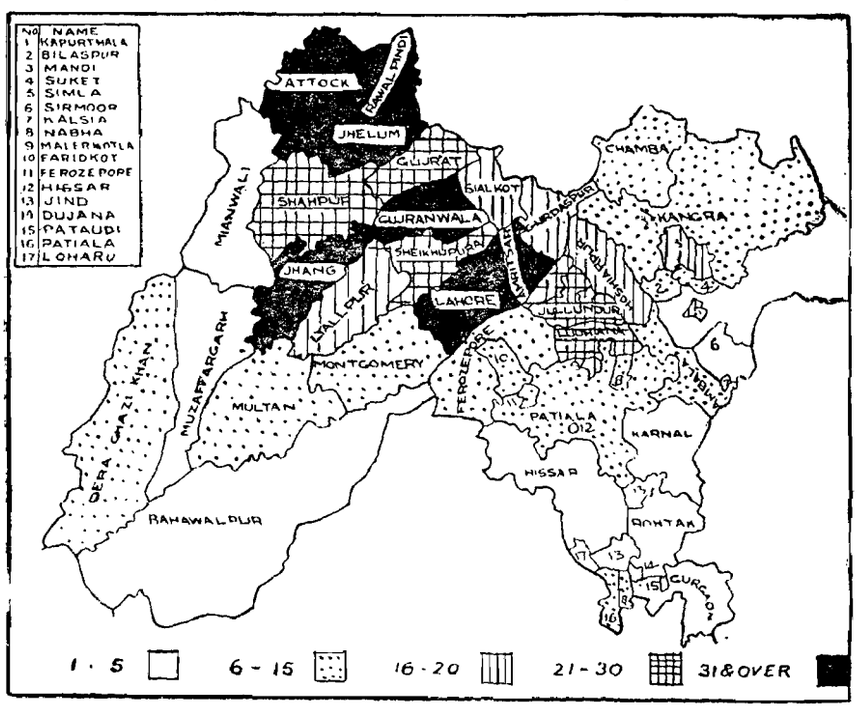

The occupational distribution of 1,000 Kashmiri workers in 1921 and 1931 is given below.

Particulars.		Weaving.	Exploitation of minerals and vegetation.	Industry.	Transport.	Trade.	Public Force.	Public Administration.	Arts and Professions.	Domestic service.	Labourers unspecified.	Others.
1		2	3	4	5	6	7	8	9	10	11	12
Proportion per 1,000 earners	1931 ..	256	144	171	46	126	27	21	31	41	102	35
	1921 ..	383	162	165	62	55	12	14	17	28	64	38

About one-fourth of the Kashmiri workers are weavers, one-fifth are engaged in other industries and a little less in cultivation, one-eighth being traders and one-tenth unspecified labourers.

285. The Khatri is one of the most important Hindu castes, and like Brahmans, Rajputs and Gujjars very few of its adherents are going over to Sikhism. There may be some Khatris, who on conversion to the Sikh faith refrain from returning caste, but such cases must be rare as Khatris never think poorly of their caste and have no objection to returning it. The figures of Hindu and Sikh Khatris are given in the margin for the last six censuses. Hindu Khatris have shown a large increase at every census except in 1911 when they decreased like the total population. Sikh Khatris in any considerable numbers are found only in the central and northern Punjab. The map in the margin shows the proportion *per mille* of Khatris in the total population of each district or state. They show a particularly large intercensal percentage of increase in areas, where colonization has been in progress during the last decade or where their number is inconsiderable. Such areas are noted below :— **Khatri.**

Religion and Locality.	*Actual Population of Khatris.*

286. The Kumhar is a large occupational caste, being mainly Muslim. Their figures for the three communities are given in the margin. A slight interchange between the Hindu and Sikh Kumhars is apparent enough, while Muslims show a uniform increase. The increase among Sikhs at the expense of Hindus is noticeable from the marginal figures, relating to Ludhiana, Gurdaspur, Amritsar, Sialkot, Sheikhupura and the **Kumhar.**

Religion.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7

Multan Division ..	3,795	2,743	911	2,121

districts of the Multan Division. The reverse, however, seems to be the case in Hoshiarpur District, where during the last decade Hindu Kumhars have increased from 3,457 to 5,079 and Sikh Kumhars have come down from 686 to 338. It is quite possible that the decrease among the latter is due to some of them having abstained from returning their caste. The Muslim Kumhars have increased in all districts except in Sialkot and Ferozepore, where Kumhars of all religions show a decrease evidently due to menials, especially Kumhars and Tarkhans, taking to agriculture. Among Kumhars 13·2 per cent. of Hindu workers, 8·2 per cent. of the Sikh and 16·5 per cent. of the Muslim are engaged in the traditional occupation of pottery, while 6·4, 7·4 and 3·2 per cent., respectively, are cultivators.

Lohar.

287. The figures of Lohars and Tarkhans had better be studied together. The total provincial figures for the six censuses are given in the margin by religion. Hindu Lohars have not shown an increase like other castes and may, therefore, be said to have been really decreasing all along, while Sikh Lohars too have been decreasing though only since 1911. The Hindu Tarkhans, who are much more numerous than Lohars, have been decreasing considerably since 1901, while Sikh Tarkhans, who showed an increase till 1911, have been decreasing since. The large increase among Sikh Tarkhans while it lasted was obviously at the expense of Hindus. The decrease in their number since 1911 is due to the discarding of the term Tarkhan and more recently to the adoption of Ramgarhia as their caste. The Hindu Lohars and Tarkhans in Kangra, Hoshiarpur and Ambala have returned themselves as Dhiman Brahmans, and in the south-east they have claimed to be Jangida Brahman. In the central districts Hindu Lohars and Tarkhans as well as their Sikh counterpart have returned their caste as Ramgarhia in increasing numbers at this census.

Caste, Religion and Locality.	1881	1891	1901	1911	1921	1931

„ Muslim A.C.D. ..	236,440	270,191	293,243	294,677	312,125	346,829

The Muslim Lohars and Tarkhans have never looked back. The two castes taken together show an increase of 46·6 per cent. since 1881 as compared to 51·2 per cent., which is the figure for the rise in total Muslim population. This disparity is mainly due to the fact that some Muslim Lohars and Tarkhans too return as their caste an agricultural tribe, such as Awan or Rajput. In towns an educated Lohar or Tarkhan, particularly when he holds a job in the public service, would invariably abstain from returning his traditional caste.

Among Tarkhans and Lohars 41 per cent. of Hindu, 56 per cent. of Sikh and 66 per cent. of Muslim workers follow the traditional occupations as against 58, 61 and 72 per cent. in 1921, respectively. It appears that among Hindus and Sikhs a comparatively large proportion of Lohars and Tarkhans has given up the traditional occupations and the percentages quoted for them would have been even smaller but for the fact that when traditional occupation is given up the return of caste is in many cases also given up.

288. See paragraph dealing with Jhiwar. **Machhi.**

289. The figures of Mahtams illustrate with great clarity the social evolution of tribes. The figures are reproduced in the margin for the Province from Table XVIII and for each district from Table XVII and the corresponding tables of the past censuses. Mahtams for the most part have within the last few generations regained Rajput status, from which according to Sir Denzil Ibbetson they had originally fallen. That all sections of Mahtams—Hindu, Sikh or Muslim—were endeavouring to attain their lost status and that practically half of the Hindu and Sikh Mahtams have succeeded in so doing; so far as the census is concerned, is borne out by the figures which show a big decrease during the last decade. At this census nearly 2,000 of them returned their caste as Rajput, but as their traditional caste was also recorded, they were not included among Rajputs. **Mahtam.**

290. The Mali and Saini are in reality one and the same tribe, the former being considered inferior. The recent variations in the strength of these two castes have been discussed in the last Chapter (paragraph 218), a reference to which will show an increasing tendency among Malis to return themselves as Sainis. **Mali.**

291. The Meghs are an inferior caste, being more akin to Chuhra than to any other caste with this difference that their traditional occupation is weaving and not scavenging. The home of Meghs is Gujrat, Sialkot and Gurdaspur. The figures for these districts are given in the margin for the last six censuses. They show a decrease in Sialkot, while in the case of the other two districts, the caste has practically disappeared at this census. My enquiries show that in Gujrat Meghs have adopted Vedic Dharm and returned their caste as Arya instead of Megh, while in Gurdaspur they have returned themselves as Sikh or Ad-Dharmi without stating their caste. **Megh.**

District.	Megh.

Gujrat ..	1,373	1,438	1,540	1,019	1,028	..

Meo.

292. The Meo is an agricultural tribe, confined almost entirely to the Gurgaon District. The number of Meos in Ferozepore has increased during the last decade from 127 to 5,253, owing to their presence as labourers on the Sutlej Valley Project (in the Ferozepore Tahsil) and in the Abohar and Fazilka *mandis*.

The Meos are a backward tribe, and agriculture is their traditional occupation. During the last decade their percentage of literacy has gone up from 6 to 9, mainly as a result of the uplift work among them. The occupational distribution of 10,000 Meos according to the last three censuses is given below.

Occupational distribution of 10,000 *Meo earners for the last three censuses.*

Year.	Traditional occupation (agriculture).	Exploitation of animals and vegetation.	Exploitation of Minerals.	Industries.	Transport.	Trade.	Public Force.	Public Administration.	Arts and Professions.	Persons living on their income.	Domestic service.	Contractors, clerks, cashiers, &c.	Labourers unspecified.	Beggars, &c.
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1911 ..	9,192	429	39	158	55	28	7	11	25	2	15	1	25	13
1921 ..	9,695	53	4	72	28	51	32	14	14	1	11	4	10	11
1931 ..	8,729	969	2	45	66	77	12	34	33	4	15	1	2	11

Mirasi.

293. The figures of Mirasis, who are almost entirely Muslim, are given in the margin for the last six censuses. There is a decrease among Hindu Mirasis of Karnal, Ambala and Kangra, probably due to return of some other caste-name, such as Bhat. There is a decrease from 9,653 in 1921 to 1,113 in 1931 among Hindu Mirasis of Sialkot, due to most of them having adopted Vedic Dharm and returned their caste as Arya. More recently in certain districts there has been a tendency among Muslim Mirasis to claim Qureshi as their caste, but as they are mostly found in villages, the Patwaris who carried out the preliminary enumeration were able to record the traditional caste. Only 1,441 Mirasis claimed dual castes as shown in Appendix II, Jat being the favourite caste claimed, the next best being Pathan and Sheikh.

Caste.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Muslim Mirasi ..	191,383	217,522	220,174	221,662	225,104	241,660

Mochi.

294. The Hindu Mochis have been grouped with Chamars. They are shoemakers of the eastern districts, who have settled mostly in the urban areas of the central Punjab, the largest numbers being found in Lahore District with a preponderance of males.

The Muslim Mochis have increased during the last decade everywhere except in the Ambala Division, where they are not at all numerous, the only considerable number being returned from Hissar. The strength of the Muslim Mochis in the central and western Punjab is shown in the margin for the last six censuses. The figures show a steady increas fairly commensurate with the general rise in total population.

Particulars.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Muslim Mochis ..	333,828	379,192	405,736	406,545	424,792	461,016
Percentage increase ..	..	13·6	7·0	·2	4·5	8·5

The proportion of Muslim Mochis engaged in the traditional occupation of shoe-making is 692 *per mille* of the total workers, and that of Hindu Mochis 618.

295. Like Muslim Mochis Mussallis are only found in the central and western Punjab. There is hardly any Mussalli in the Ambala Division and not a single one in the Punjab States except Bahawalpur. During the last decade Mussallis have increased from 361,098 to 412,300 or by 14·2 per cent. The percentage of rise is particularly large in colony districts, to which Mussallis migrate in lagre numbers mainly to become agricultural labourers and workers in factories. The figures for colony districts are given in the margin. In villages Mussallis are mostly engaged either in their traditional occupation of sweeping or in field labour. But in urban areas besides their traditional occupation they take to a large variety of jobs, and are found working as weavers, cooks, water-carriers, fireworks-makers, dyers, bandsmen, etc. This would show that a chuhra on conversion to Islam takes to odd jobs, denied to a Hindu chuhra. The figures below give the present occupational distribution of Mussallis. Mussalli.

MUSSALLIS.

District or State.	1921.	1931.	Variation percentage.	Percentage increase among total Muslim.
1	2	3	4	5
Gujranwala ..	16,833	19,901	18·2	17·6
Sheikhupura ..	9,066	16,062	77·2	34·8
Gujrat ..	40,403	48,465	20·0	10·9
Shahpur ..	56,402	63,773	13·1	14·0
Lyallpur ..	31,362	37,069	18·2	21·2
Bahawalpur ..	13,742	27,230	98·2	23·5

Occupational distribution of 10,000 *Mussalli earners of both sexes for* 1931.

Sex.	(Sweeping) Traditional occupation.	Exploitation of animals and vegetation.	Exploitation of Minerals.	Industries.	Transport.	Trade.	Public Force.	Public administration.	Arts and Professions.	Persons living on their income.	Domestic service.	Contractors, Clerks, Cashiers, etc., otherwise unspecified.	Labourers unspecified.	Beggars, Prostitutes, criminals and inmates of jails and asylums.
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Male ..	2,993	3,629	34	592	205	82	13	40	52	7	215	5	972	246
Female	486	132	2	48	6	5	..	..	5	3	24	1	135	68

It is apparent that only a small number is engaged in the traditional occupation of sweeping; the proportion of women workers also being small (144 *per mille* of male workers as against 262 *per mille* among Chuhras). Most of the Mussallis are engaged in agriculture or are labourers unspecified, who are mainly agricultural.

296. The Hindu Nais in the Province number 102,628 as against 107,655 at last census. As already remarked at an early stage in this chapter some Hindu Nais were anxious to be classed as Kulin Brahmans, but were not permitted to return this caste as Kulin Brahman is a high caste of Brahmans in Bengal. As many as 8,770 have, however, returned their caste as Nai Brahman, and 4,380 (including both Muslims and Hindus) as Rajput. A number of Nais have adopted Vedic Dharm or Sikhism, probably with a view to get rid of their caste. The figures below are illustrative. Nai.

Caste.	1911	1921.	1931.
Vedic Dharm Nai ..	..	411	966
Total Hindu Nai ..	108,600	107,655	102,628
Sikh Nai ..	34,342	34,360	41,820
	1881.	1891.	1901.
Hindu Nai ..	127,481	184,273	143,357
Sikh Nai ..	21,459	25,317	25,058

District.	*Hindu Nai.*		*Sikh Nai.*	
	1921.	1931.	1921.	1931.
Ferozepore ..	2,898	2,105	4,317	5,009
Ludhiana ..	3,559	2,239	3,182	5,012
Hoshiarpur ..	7,626	7,700	465	748
Lahore ..	1,044	812	3,776	4,104
Amritsar ..	2,062	1,050	5,566	5,984
Lyallpur ..	1,077	405	1,552	1,893

The Muslim Nais are found all over the Province, the only parts where they are not numerous being the Himalayas and the south-eastern tracts. They have shown an increase at all censuses except in 1911 when the total population decreased. The figures of the last six censuses for all the districts and states in the plains are given in the margin together with the percentage increase as well as the increase among total Muslims of the same areas. Many Muslim Nais like their Hindu and Sikh brethren seem only in recent times to have developed an aspiration to be called Rajputs. In fact, an association, known as the Punjab Rajah Central Committee, and comprising representatives of the Nais of all the three communities, existed at the time of the census with headquarters at Lahore and pressed for permission to return a caste other than Nai. Their contention was that Nai was an occupational term and that Nais of different localities and different religions belonged to various castes, most of them being Brahmans, Rajputs or Jats. It is quite likely that many Nais, specially those engaged in occupations other than traditional, were successful in returning some other caste. So the figures do not represent the actual strength of Nais.

Particulars.	1881.	1891.	1901.	1911.	1921	1931.
1	2	3	4	5	6	7
Muslim Nais (A.C.D.)	174,584	195,778	206,760	206,189	218,319	235,855
Variation ..	..	12·1	5·6	—·3	5·9	8·0
Increase among total Muslims (A. C. D.)	..	9·9	12·6	0·7	5·9	·16·5

Od.

297. The figures of the Hindu and Muslim Ods of the Punjab plains are given in the margin. The Ods are a nomadic tribe and might be enumerated in one district at one census and in another at the next. They are found mostly in the districts where canals exist, more particularly where canals are under construction, as Ods both male and female are considered very useful labourers for excavation work. They have been returned in considerable numbers from Gujranwala since 1891, Montgomery since 1911 and Karnal since 1921. In Gujranwala their presence dates back to the time of the construction of the Lower Chenab Canal and in Montgomery to that of the Lower Bari Doab Canal. In the canal colonies they also assist in the building of walls for the colonists. As many as 2,486 Ods have returned their caste as Rajput, but have been included among Ods.

Caste.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Od Hindu ..	11,540	12,316	17,911	20,375	18,282	19,583
Od Muslim ..	4,065	10,082	8,174	11,170	10,192	13,041

Pakhiwara.

298. The Pakhiwara is a small criminal tribe, mostly Muslim. The variation in its strength in the central Punjab is shown in the margin. Altogether 49 Pakhiwaras returned other castes, 12 returning themselves as Jats and 29 as Rajputs.

Caste and Locality.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Pakhiwara (c) ..	3,741	3,674	3,595	3,711	2,801	3,100

Pathan.

299. The Pathans enumerated in the Province number 345,438 as against 261,729 in 1921, which means an increase of 32 per cent. The statement on the next page shows their absolute strength and percentage increase in each district and the Punjab States, the persons with Afghanistan as their birth-place having been excluded. The increase per cent. among all Muslims of each locality has also been quoted. The particularly large increases have been registered in Lahore (11,189), Mianwali (10,440), Gurdaspur (6,944), Sialkot (6,051) and Attock (5,852), and part of the increase in Lahore, Gurdaspur and

Sialkot is due to the caste Pathan having been claimed by some other castes, notably Kakkezai.

300. The Qasabs now number 127,198. They have shown an increase at almost all censuses as will appear from the marginal figures, the increase being particularly large in the canal colonies during the last decade. The figures of the south-eastern districts, however, deserve a closer study. The Qasab of the south-east, often designated as *Beopari*, claims to be Sheikh. If he returns himself as Sheikh Beopari as he often does, we know his traditional caste is butcher, but there is no help when he returns himself merely as Sheikh. The figures of Qasabs and Sheikhs for certain units of the eastern Punjab are given in the margin. The large increase in the Sheikhs of Ambala and Rohtak is, no doubt, mainly due to the remarkable decrease among Qasabs. In Hissar and Gurgaon the 1921 figures of Qasabs seem to have been exclusive of Beoparis, re-included in 1931. The complete disappearance of several thousands of Qasabs in Patiala State since 1911 is an eloquent testimony in support of this view.

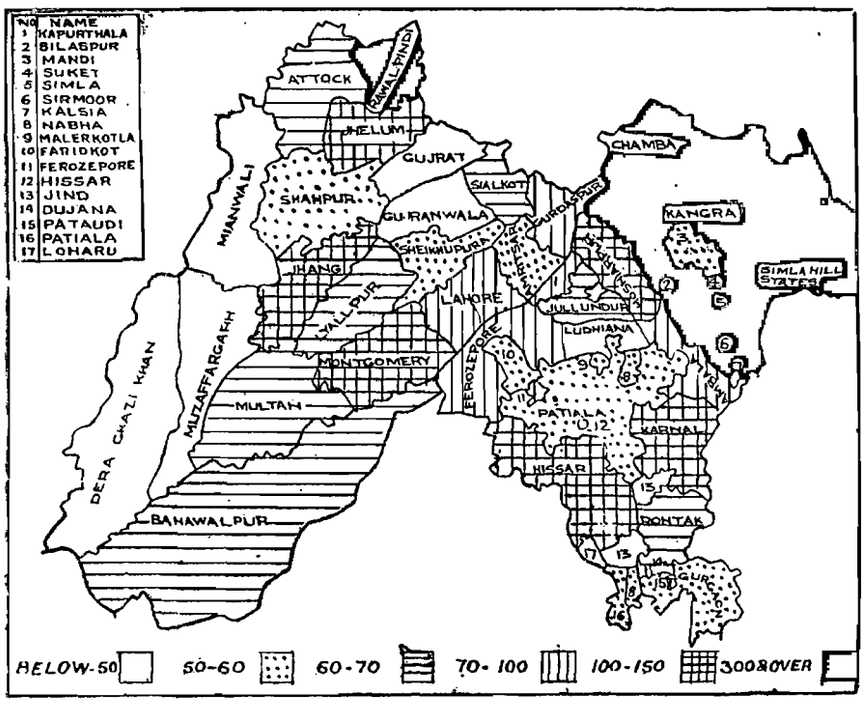

Qasab.

Rajput.

301. As already remarked, the caste Rajput is next to Jat, the largest collection of castes or tribes in the Province. It will be well in the first instance to see the proportional distribution of Rajputs in the total population of each district and state, which is indicated by the map in the margin. The Rajputs are most numerous in the Himalayan Natural Division and Rawalpindi District where they form 300 to 500 *per mille* of the total population. The next highest proportion, *i.e.*, 100 to 150 *per mille*, is found in Jhelum, Jhang, Montgomery, Hissar, Karnal and Hoshiarpur. The total strength of Rajputs and allied races such as Kanet, Rathi, Rawat, Thakar, Dhund and Gakkhar are given in the margin for the six censuses, for thus only is a fair comparison possible. The bulk of the Rajput population is Muslim and Hindu, and like Khatris, very few Hindu Rajputs have gone over to Sikhism. The big increase among Rajputs during the last decade does not appear to be due to natural increase. The respectability of Rajput caste is beyond doubt; the term Rajput literally means a Raja (ruler)'s son. On the present occasion more than at any previous census numerous people belonging to various other castes, not quite so elevated in the social scale, have claimed Rajput status and in many cases succeeded in returning themselves as Rajput without disclosing their traditional caste. The line separating Jats from Rajputs is rather vague in certain localities. For example, the Sials of Jhang, who had previously been recorded mostly as Jats, have returned themselves at this census as Rajputs. A possible cause of variation in the number of Muslim Rajputs is, therefore, the inclusion or exclusion of certain sections of agricultural tribes. In the case of Hindu Rajputs the variation is partly explained by the decrease among such castes as Sunars and Jhiwars

Rajputs and allied Castes per mille *of population, 1931.*

inclusive of Mehras. The figures of certain districts given in the margin furnish some evidence on this point. Coming now to the big increase among Muslim Rajputs during the last decade, we should separate the districts in which the intercensal increase has been more or less proportionate to the rise in the total Muslim population and those in which it has been in excess. The two sets of figures for each district and Punjab States are given in the table below. The percentage increase in the case of the first six districts in the

Actual variation among Hindu Rajputs and certain other Hindu castes.

table, *viz.*, Jullundur, Karnal, Ambala, Attock, Ferozepore and Rohtak requires no explanation, being proportionate to the general rise in the population. In the case of some of the other districts an explanation is called for, though not so easy to furnish in all cases. The rise is small in Simla, Kangra, Muzaffargarh and Mianwali, while there is actual decrease in Dera Ghazi Khan and Shahpur, and in all these districts Muslim Rajputs are very few. The next higher rates of increase are in Gujranwala, Ludhiana, Shahpur, Gurgaon, Hoshiarpur, Sheikhupura and Sialkot, and in these districts too there are not many Rajputs. The somewhat higher percentage increase in Gujrat, Gurdaspur, Jhelum, Jhang and Amritsar is mainly attributable to some members of certain agricultural tribes and occupational castes having returned themselves as Rajput. The increase in Lyallpur, Multan and Montgomery is mainly due to the influx of immigrants. Coming to the districts where Rajputs are really numerous, we find that the increase in Hissar is mainly due to the return home of demobilized Rajput soldiers and to the fact that Pachadas, who return themselves as Rajputs, had temporarily migrated from the District in considerable numbers at the time of the 1921 census owing to the prevailing drought. The large increase in Jhelum and Rawalpindi is due largely to the return home of ex-soldiers and to

members of some other castes having returned themselves as Rajputs on the present occasion. The occupational castes in many cases have claimed Rajput status, particularly the well-to-do persons following occupations other than traditional in urban areas.

We may now proceed to estimate the extent, to which Rajputs of all religions have gained through accretions from other castes. We will do this with the help of their age distribution at this and the last census.

**Total Rajput and allied castes including Dhund and Gakkhar* ..	2,359,179
Probable survivors (aged 10 *and over in* 1931)	1,903,857
Actual number returned as Rajput aged over 10 *in* 1931 ..	2,009,823
Absorption from other castes among Rajputs aged 10 *and over* ..	105,966
Absorption among children under 10 *years of age* ..	6,867
Total absorption for all ages	112,833

In addition to this absorption, which is mainly attributable to Rajput having been returned as their caste by persons, who at the 1921 census returned other castes, there are 94,485 persons who claimed the Rajput caste, but were at the time of tabulation included in the traditional caste, which had also been recorded in accordance with the instructions issued. Among these the principal figures relate to Sunars (33,000), Jhiwars (8,700), Julahas (8,500), Mochis (5,500), Tarkhans (4,450) and Nais (4,400).

Ramdasia. 302. The Ramdasias are practically the same as Chamars, and the figures of the two have been discussed in the paragraph on Chamars.

Saini. 303. The Sainis have been dealt with along with Malis, to whom they are very much akin.

Sansi. 304. The Sansis are scattered all over the south-eastern and central parts of the Punjab, and 70 per cent. of them, or 25,825 out of 33,228, returned their caste as their religion. Their figures were thrown into the Hindu religion as at last census, it being recognized that there is no tribal religion in the Punjab. Of the remaining 7,403 Sansis, 4,956 returned their religion as Hindu, 825 as Muslim, 1,238 as Sikh and 384 as Ad-Dharmi. The instructions in the Census Code, which were the same as at last census, required that in the case of persons professing a tribal religion such as Sansis, the caste should be recorded in the column of religion, and but for this instruction many more Sansis would probably have returned some definite religion. The variation in the number returned as Sansis is given in the margin since 1881 together with the variation among those who returned themselves or were classed as Hindus on each occasion. The occupational distribution of the Sansis for the last two censuses is given below:—

Particulars.	1881—91.	1891—01.	1901—11.	1911—21.	1921—31.
1	2	3	4	5	6
Sansis in A. C. D. All religions ..	+2,289	+3,782	−1,561	−7,037	+10,860
Hindu ..	+256	+5,412	−1,636	−4,932	+9,575

Occupation distribution of Sansi earners per mille.

Year.	Traditional occupation (crime).	Exploitation of animals and vegetation.	Exploitation of minerals.	Industries.	Transport.	Trade.	Public Force.	Public Administration.	Arts and Professions.	Persons living on their income.	Domestic service.	Contractors, clerks, cashiers, etc. otherwise unspecified.	Labourers unspecified.	Beggars, prostitutes, criminals and inmates of jails and asylums.
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1921 ..	196	272	2	32	20	30	2	4	7	1	12	..	37	385
1931 ..	46	434	5	28	8	40	..	3	9	..	17	1	45	364

*Amount of absorption is calculated by the process pointed out in paragraph 233 in connection with the figures for Sikhs.

It is apparent that Sansis are taking more and more to agriculture, having been allotted colony land and established in settlements under State supervision. There is a large decrease under their traditional occupation of crime, but it is rather doubtful whether the traditional occupation was really returned by the person enumerated or merely presumed by the enumerator.

Sarera.

305. The figures of Sarera for the last six censuses are given in the margin. This caste like other low castes has shown no advancement in numbers. The figures for its home districts are given in the second table, and show that many Sareras, particularly in the Jullundur and Hoshiarpur Districts, have become Sikhs during the last decade.

Particulars.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Sarera B. C. ..	10,792	11,366	9,587	10,743	9,873	11,230

Locality.	SARERA.					
	Hindu.			*Sikh.*		
	1911.	1921.	1931.	1911.	1921.	1931.
1	2	3	4	5	6	7
Kangra ..	4,378	3,845	3,378	9	30	2
Hoshiarpur ..	3,646	3,516	3,025	1,160	1,196	2,061
Jullundur ..	106	31	33	83	173	2,006
Gurdaspur ..	489	523	279	5	1	15

Sayad.

306. The figures of Sayads enumerated in the Punjab plains are given in the margin for the last six censuses. The increase at each census and the total increase among all Muslims of the same locality is also given. It is well known that Sayads receive accretions from other castes, many people claiming Sayad as their caste as soon as they become well-to-do.

Locality.	SAYAD.					
	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7

Variation percentage	..	+8·1	+6·3	+3·6	+3·3	+18·7
Variation percentage among all Muslims (A. C. D.) ..	..	+9·9	+12·6	+0·7	+5·9	+16·5

Sheikh.

307. From 256,971 in 1921 the Sheikhs of the plains have increased to 414,623 or by 61·4 per cent. The figures for the last six censuses are given in the margin. There seems to have been no remarkable variation between 1881 and 1921, the figures in the latter year being actually in defect. The big increase during the last decade is due to numerous members of other castes, mainly occupational, having returned their

for opportunity to secure a large voting strength. In Ludhiana, Ferozepore and Ambala the Sikh element will probably retain its hold, but it will not be a case of plain sailing and the struggle may easily take a serious turn.

Estimate of the Probable Number of the Depressed Classes.

The Social Map in the beginning of this Report shows the population of the castes, which have been classified as ' depressed ' according to the above tests out of those for which we had the figures. Such castes comprise all Ad-Dharmis and the Hindu castes, Bawaria, Chamar, Chuhra, Dagi and Koli, Dumna, Megh, Od, Ramdasia, Sansi and Sarera, and their strength in British Territory comes to 1,310,709. It is true that we have not got the figures for some other castes, which are also untouchable, but all of them are numerically unimportant. An estimate of the present population of these minor castes * made on the basis of the 1921 figures, indicates their population to be 131,300. Thus the total figure for the Hindu and Ad-Dharmi depressed classes will be nearly a million and a half. If all the depressed classes get the vote, their population is likely to be slightly larger, as the indications are that in that case they may be joined by some of the low classes among Sikhs and Muslims. It may be remarked that the aggregate of Hindu depressed classes does not include the figures of the members of those classes, who have been converted to Vedic Dharm and returned no caste or merely Arya in the column of caste.

It is necessary to add that the strength of each of the depressed castes, named above, by religion and sex are given in Imperial Table XVII for each district and state. Similar figures of Ad-Dharmis are given in Imperial Table XVI.

The figures of total population and literacy for each Tahsil in British Territory are given for Ad-Dharmis and four of the most numerous depressed castes, namely Chuhra, Chamar, Dagi and Koli and Sansi, in Provincial Table II. In the Social Map in the beginning of this Volume the light-blue portion of the rectangles represents the total strength of Ad-Dharmis and the Hindu depressed classes for which figures are available. Appendix I to Chapter XI is a key to this map and gives the actual and proportionate figures for each unit of the Province. It will be observed that the Ramdasia is put down as one of the Hindu depressed classes and in this connection it has only to be added that these persons returned themselves as Hindus by religion and Ramdasia by caste. They are really Chamars and belong properly to the Hindu depressed classes. Those Ramdasias who retured themselves as Sikhs are not included in these figures.

*Mazhabi, Marecha, Bangali, Barar, Bazigar, Bhanjra, Chanal, Daoli (Doala), Dhanak, Gandhila, Gedri, Kehal, Khatik, Kori, Nat, Pasi, Perna, Rihar, Sapela and Sirkiband.
