have been adjusted so as to apply to existing divisions and not to the divisions which existed at the time those statistics were prepared In this way alone a comparison is possible at present

Changes in Boundaries and Areas

3 Paragraphs 4 to 6 of the report deal with changes in the boundaries of administrative units that have taken place during the last decade There has been no change of any importance since 1921

Operations of the Present Census.

4 The census operations have been discussed at length in the Administrative Volume, Part IV of this Report but as that Volume is intended only for departmental and local use I propose briefly to describe here each stage of the operations which in point of procedure have practically remained unchanged since last census

Initial Arrangements.

5 I assumed charge of my duties on the 1st April 1930 and lost no time in setting about the work. I issued my preliminary circular together with the first three Chapters of the Provincial Census Code in the first week of May The circular contained a *résumé* of all the stages of the Enumeration work while the three Chapters of the Code supplied the necessary guidance for the preliminaries which had to be got through before the commencement of house numbering District Census Officers in every district and Census Superintendents in every state were appointed and the preparation of General Village and Town Registers on which the formation of census divisions rests was taken in hand at once The General Village Register showed for each *tahsil* the names of all villages and the number of houses in each while the Town Register showed for each town the names of wards *mohallas* etc., and the number of houses in each. Sketch maps of villages and towns were also prepared showing the houses in each village and town The next step was to parcel out all villages and towns into Blocks in which the enumeration could be carried out by one enumerator These Blocks were grouped in Circles under Supervisors, and Circles again grouped in Charges under Charge Superintendents. In the towns care was taken that the Circles should be conterminous with the Administrative and Elective wards. These divisions were roughly marked on the sketch maps and finally revised after the completion of house-numbering At the time of the final census there were 180,300 Blocks 14,580 Circles and 1 048 Charges and the enumeration was carried out by 180,631 Enumerators under the direction of 11,670 Supervisors and 1,039 Charge Superintendents. In the rural areas the Field Kanungos and Patwaris as a rule acted as Charge Superintendents and Supervisors respectively In the cities and towns the supervising agency was recruited mostly from amongst Municipal officials The Enumerators both in the urban and rural areas were mainly voluntary non-official workers. The appointment orders were issued under the provisions of the Census Code and each enumerator was treated as a public servant

House-numbering

6 The next item in the programme after the census divisions had been provisionally fixed was the numbering of all houses. This work commenced about the middle of September and was completed within two months Every house, which was likely to be occupied on the final census night was marked with a number all houses in a Circle being numbered serially In rural areas the house-numbering was carried out by the Supervisors who were as a rule Patwaris, while in cities and towns the Municipal or Notified Area Committees had the needful done The total number of houses numbered in the whole Province was 8 167 789 but on the final census night a considerable number of houses which bore numbers had no occupants, the number of occupied houses being 5 913 652, or 73 per cent of the houses numbered When the house numbering was completed in the middle of November the census divisions were revised and fixed finally

The Preliminary Enumeration.

7 In August a complete issue of the Census Code and the Manual of Instructions for the Charge Superintendents and Supervisors were supplied to each district and state *Brief instructions for the guidance of enumerators* were printed on the correct the Enumeration Books.

Early in September before the house-numbering actually commenced the necessary training was imparted by the District Census Officers and State Census Superintendents to the census staff From the middle of November to the end of December the staff was trained in the work of enumeration the instructions

filtering through from the Provincial Superintendent down to the Enumerator. District Census Officers and State Census Superintendents gave a practical training to the Charge Superintendents, who in their turn instructed the Supervisors The Enumerators were trained by the Supervisors during December and January

The whole month of January was devoted to the work of preliminary enumeration in rural areas, while in the cities and towns it began on the 20th January and was finished in most places by the middle of February There was an Enumeration Book for each Block, it consisted of a cover and a certain number of schedules, which were stitched together The cover contained brief instructions for the Enumerator and an abstract to be completed and detached after the final enumeration The schedules had 18 columns which were to contain particulars about each person enumerated The first column was meant for the house number, and each page could contain particulars about eight persons

In the course of the preliminary enumeration which in towns was generally carried out by enumerators, the work was checked by the supervising staff and care was taken to bring the entries up to date even during the period intervening between the preliminary enumeration and the final census Entries were made in the schedules only about those persons who were to be present in the houses on the final census night

The Final Census

8 The final census was merely the process of bringing up to date the entries made in the schedules during the preliminary enumeration It began at 7 P M on the 26th February and lasted until midnight The Enumerators went round their Blocks, and verified the entries in respect of each house Persons who had arrived after the preliminary enumeration, *i e*, guests or newly-born children, were entered in the schedules, and the entries about those who had left the house or died were scored out Early next morning the Enumerators met the Supervisor at an appointed place, gave a serial number to each entry in the book and struck out totals of occupied houses, persons, males and females Similar totals were prepared by the Supervisors for their Circles and by the Charge Superintendents for their Charges The charge summaries were totalled for the district or the state at the district or state headquarters and then telegraphed to me at Lahore and to the Census Commissioner for India at Delhi

Non-synchronous Census

9 In some parts of the Province the countryside is wild and the danger from wild beasts considerable, and it was therefore considered advisable, as in 1921, to hold the final enumeration before sunset on the census day Such tracts are the Morni *ilaqa* in the Ambala District, certain isolated parts of the Gurgaon District and the Biloch Trans-frontier Tract In the high mountains of the Himalayas more serious variations from the normal procedure were necessary, as they become snow-bound during winter and some of them as early as September. On the present occasion more tracts (detailed in the margin) had to be subjected to a non-synchronous census, as the census took place about the end of February or nearly three weeks earlier than the census date in 1921 The results of the non-synchronous census were treated as part of the February census

	Date of Census
KANGRA DISTRICT—	
Kothi Kohr and Sowar including Bara Bhangal	20 9-30

BASHAHR (SIMLA HILL STATES)—	
Chini and Dodra	1 12 30

Attitude of the Public

10 The census of 1931 was held during a period of political upheaval accompanied by an economic depression The people knew that the future constitution of India was being moulded, and that their political rights mainly depended on the census figures In these circumstances, the various communities made efforts to secure their full representation by having all their individuals recorded in the census schedules, and in some cases they did not hesitate to swell their numbers by unfair means The menial classes, mainly Chamars and Chuhras in the central Punjab, in order to consolidate their position wanted to return their religion as "Ad-Dharmi" A tug-of-war started in some districts, and Ad-Dharmis were required by Sikhs and Hindus

not to return themselves as Ad Dharmis Particularly in Ambala, Ludhiana Ferozepore and Lyallpur the Sikh land-owners employed all sorts of measures not infrequently bordering on terrorism, to secure the return of religion of Chuhras and Chamars as Sikh.* In some urban areas the Enumerators made efforts to swell the figures of their community by bogus entries and to curtail those of a *rival community by scoring out the entries* made in the course of the preliminary enumeration. In one town the various communities in order to secure more seats on the Municipality sent for their friends from the neighbouring villages in order to have them recorded as town-dwellers on the final census night and thus to increase their numerical strength. The effort however proved valueless as the numerical strength of all the communities rose uniformly leaving undisturbed their proportions resulting from the preliminary enumeration.

In some large urban areas the work of many Enumerators was character ized by apathy and indifference and consequently there were many cases of omission. Thus the excess resulting from bogus entries was counteracted to a certain extent at least by cases of omission. But for the keenness and vigi lance exercised by the various District Census Officers the cases of omission or artificial swelling of figures would have been more numerous and on a much larger scale. It has to be remembered that bogus entries made or houses and *individuals left unenumerated in certain areas cannot materially affect the census* figures which run into millions.

Another tendency noticeable on the present occasion was to return Urdu or Hindi as the language instead of Punjabi This tendency was mainly confined to large towns. In the matter of script also the town-dwellers in some places evinced keenness to return themselves as literate with a view to swell the figures of literacy for their community

A marked tendency was to return a caste other than traditional. Members of certain occupational castes sought to be returned under an agricultural caste, *e.g.*, Muslim *tarkhans* and *lohars* as Awans *nais sunars* and *julahas* as Rajputs etc Hindu *lohars* and *tarkhans* were anxious to return themselves as Dhiman Brahmans Hindu *nais* as Brahmans, Hindu *darzis dhobis* etc. as Tank Kshatriya and Sikh *lohars* and *tarkhans* as Ramgarhia

Arrangements for Railways, Fairs and Migratory Population.

11 Though the date of the general census is chosen so as not to clash *with large congregations of people on the occasion of festivals or at certain places* of pilgrimage it is impossible to avoid some of the ordinary local gatherings. Adequate arrangements for fairs and other large gatherings of people were made beforehand and in some districts such as Rohtak and Ludhiana several thousand persons attending fairs were enumerated by the special staff employed.

Special arrangements were made for the enumeration of persons travelling by rail on the census night and as each was enumerated he was given a pass to *prevent him from being enumerated a second time and as a further precaution* his ticket was marked with the letter E to indicate that he had been enumerated The Railway census was carried out under the supervision of the civil authorities and the Agent or Manager of each Railway line nominated a Railway officer to assist the District or State officer in the organization of the Railway census in the district or state. The Railway stations were made into separate Blocks or Circles in the districts or states in which they were situated and the special enumerating staff known as Platform Enumerators was employed at each station at 7 P M on the night of the 28th February and remained on duty till 6 A M next morning The staff enumerated each passenger alighting or en training who did not possess a pass. There were however some people on trains who had entrained before sunset and had not left the train until next morning and even they were not allowed to escape enumeration. The running

*The Deputy Commissioner of Ambala (Mr. Fleetwood-Hesketh) in his report on the census operations says:— The Sikhs did increase their number by all possible means. They persuaded their *bandis* (village menials) and others to give their religion as Sikh. They started regular propagands in most of the villages. For instance in village Kalanaur this propaganda was carried to its extreme, and the Mahajans, Chamars, and even Christians were forced to give their religion as Sikh.

The Deputy Commissioner of Ludhiana (Mr. Connor) remarks:— The proprietary bodies of villages put great pressure upon their kamins to return themselves as Sikhs and I think they succeeded to a great extent in many villages.

The Deputy Commissioner of Ferozepore (Mr MacFarquhar) says:— Ad-Dharmis were really anxious to commandeer their position as a separate community but on three reaching in rural areas great pressure was brought to bear by their Sikh landlords to return themselves as Mazhabi Sikhs or Sikhs instead of Ad-Dharmis. Many such Ad-Dharmis had to yield under the pressure, they being the village menials generally

The Deputy Commissioners of Lyallpur Lahore and Sheikhupura have made similar remarks.

train Enumerators were employed throughout the night to count the persons in running trains, and all trains were stopped at 6 A M on the 26th February, and all passengers who had not got passes were enumerated

For persons journeying by road during the census night Enumerators were posted at all main roads and ferries, while definite instructions were issued for the enumeration of troops on march Regarding the persons spending the night in fields or at wells in the villages, the instructions were that they should be enumerated as being present in their houses, as also persons in towns dining out with friends

Provisional Totals

12 As explained in paragraph 8 the totals for each district and state were prepared with all possible promptness after the census These totals included all persons enumerated at their houses or while travelling, and care was taken to add up the figures of the non-synchronous areas The District or State authorities took all possible measures to ensure a speedy collection of figures from remote places, and camels, ponies, motor-cars and lorries were among the means so employed

The Kapurthala, Pataudi, Nabha, Jind and Loharu States were all able to telegraph their provisional totals to me and to the Census Commissioner for India on the 27th February, while in British Territory Gurgaon, Mianwali, Kangra, Jullundur and the Trans-frontier Biloch Tract of Dera Ghazi Khan telegraphed the totals on the 1st March In most cases the totals had been received by the 3rd March, and only seven districts and two states (Malerkotla and Simla Hill States) remained to telegraph them on the 4th and 5th March The figures telegraphed so promptly are compared below with those finally tabulated, and the negligible difference between the two totals points to the high standard of accuracy attained

	Occupied houses	Persons	Males	Females	Variation per cent
PUNJAB					
Provisional Totals	6,004,717	28,490,057	15,558,230	12,931,827	003
Final Totals	5,943,652	28,490,857	15,561,194	12,929,623	

Slip-copying

13 The next stage in the operations was to get the entries in the general schedules copied on to slips The slips were issued in five different colours, one for each of the main religions and one for all other religions Sex and civil condition were indicated by symbols on the slips, the symbol for unmarried of each sex was printed on each slip to be converted to "married" or "widowed" by hand according to requirements Thus there were five different colours and two different symbols giving a total of ten easily distinguished slips The other particulars recorded about each person were written out by hand in the slips, a previously arranged system of abbreviations being used Special slips were issued for the recording of infirmities

The work of slip-copying was done by the revenue staff at the Tahsil headquarters, while in the case of large towns it was done by copyists engaged by Municipal Committees For rural areas and small towns the Patwaris acted as copyists, and their work was on the whole satisfactory, while that done in Municipalities with a few exceptions was susceptible of much improvement, mainly owing to the temporary staff employed lacking a sense of responsibility In most places the copying work was commenced on the 1st March and completed within a fortnight In some Municipalities considerable delay occurred, and the slips came in about the end of April or nearly a month and-a-half after the due date

Sorting

14 Two Central Sorting offices were opened at Lahore and one at Delhi, and the completed slips were sent to these offices, where large staffs sorted them according to the various heads required for each table of the Report The Delhi Sorting office dealt with the slips of the Delhi Province, the districts of the Ambala Division and the neighbouring states The Phulkian States, Patiala, Jind and Nabha, and Bahawalpur State carried out their own sorting and compilation.

The two Sorting offices at Lahore divided up the rest of the districts and states for the sorting work. At each Sorting office care was taken that the slips of different units to appear in the tables remained separate Information for each of the Imperial Tables was extracted one by one as also for the Provincial Tables appearing in Part III The results of the sorting were filled up in Sorters tickets which were sent on to the Central Compilation office at Lahore This work was finished in about five months

Compilation.

15 During this stage the entries in Sorters tickets of different religions and localities were copied out in registers, and tahsil and district totals as well as totals for certain towns were struck for all the tables. The final tables were then prepared and from them the derivative tables, known as subsidiary tables which appear at the end of each Chapter of this Report The Compilation office was in charge of my Personal Assistant who had under him a large staff of Inspectors and Compilers, and the office began to function in May 1931 the first table was sent to the press in September 1931 and the last table was finally printed off in November 1932.

Publication.

16 The results of the census are published in four parts, and the months in which these were issued or in which it is expected that they will issue are as follows —

Part I —The Report during April 1933

Part II.—The Imperial Tables during February 1933

Part III —Appendices to the Imperial Tables during March 1933.

Part IV —The Administrative Volume during April 1933

Cost of Census.

17 The census of the two Provinces (Punjab and Delhi) has cost Government Rs. 3,57 762 which works out at Rs. 12-4-5 for every 1 000 persons enumerated thus compares with Rs. 7 59,221 or Rs. 14-0-8 for every 1,000 persons in 1921 In addition to this sum of Rs. 3 57 762, the total cost of the census includes Rs. 28 084-12-0 recovered from Municipalities etc., on account of the cost of tabulation, Rs. 8 912-4-0 recovered from Indian States on account of the cost of forms, sorting and compilation The Indian States have reported a cost of Rs. 58 735 for the enumeration carried out by them. The Phulkian States and Bahawalpur have been omitted altogether in the calculation of these figures as they carried out the whole of the operations themselves.

Acknowledgments.

18. It is with a sense of very great pleasure that I now turn to my last duty which is to thank all those to whose help and co-operation the successful completion of the census operations is due In this grateful acknowledgment I include all officials and non-officials who in one way or other participated in the census work without expectation of any remuneration or reward. In particular I wish to acknowledge the great service rendered by the revenue agency of the Province without whose help the success of the enumeration or slip-copying work would be well nigh impossible It is true that no other branch of public service contributes to the census operations the same amount of attention and trained ability The Patwaris and Field Kanungos with very few exceptions discharged their onerous duties faithfully and well while the Sadar Kanungos barring one or two were most helpful The majority of the Tahsil officers also exerted themselves in the supervision of the work though not to the same extent as the subordinate staff. The District Census Officers did praiseworthy work and but for their great devotion to duty and vigilance the census schedule would have contained a larger amount of inaccuracy resulting from the communal struggl The Deputy Commissioners were unable to give any considerable time to the census work, but whenever a call was made on their attention the response was generous

The Census Superintendent of the Punjab States showed great keenness in the supervision of the census work, and their arrangements were in all cases efficient To those among them whose work was characterized by outstanding merit I have conveyed my special thank

I am very grateful indeed for the kindness of the gentlemen who found time to read the manuscript of some portions of my report and offered valuable suggestions. Mr Calvert C I E., I C S., Financial Commissioner Punjab,

kindly read the Chapters on Age and Sex, Major Lodge-Patch, I M S , Superintendent of Mental Hospital, the Chapter on Infirmities, and Sir George Anderson, Kt , C I E , the Chapter on Literacy, while the Hon'ble Sir Jogendra Singh, Kt , Minister for Agriculture, and my predecessor, Mr Middleton, I C S , Sessions Judge at Rawalpindi, went through the Chapter on Religion To all of them I am most grateful for having evinced much interest in my work and offered me the benefit of their criticism Several heads of departments very kindly sent me notes on the progress made during the last decade by their respective departments

My warmest thanks] are due to Mr Tyson, Superintendent of Lahore Government Press, who not only did much printing for me with the greatest possible promptness, but was always ready to help me with his advice in all my problems connected with printing He is also getting my various volumes bound up very nicely The staff of the *Civil and Military Gazette* Press, particularly the Works Manager, Mr Wollen, deserve my thanks for their great keenness to print the Punjab and Delhi Reports and Tables expeditiously and well The Census Code in Urdu and the forms for enumeration, sorting and compilation as well as the slips for slip-copying were printed mostly at the Mufid-i-Am Press The work done by that Press at every stage was praiseworthy, and my special thanks are due to the manager, Lala Labha Ram, for his keenness and whole-hearted co-operation

Of the three Deputy Superintendents, who had charge of the Sorting Offices, Chaudhri Nasar Ullah Khan, Extra Assistant Commissioner, has stayed on till the end, having become my Personal Assistant when Lala Behari Lal proceeded on leave in the middle of October 1931 On his sorting work at Delhi he brought to bear the qualities of great industry and intelligence, and as Personal Assistant I have found him quick, capable and devoted to his work, and at the end of the term I can without hesitation say that I could not have wished for a better colleague A word of praise is also due to Sardar Kehr Singh, Deputy Superintendent, who discharged his duties with great diligence Among the Inspectors of the Compilation office I shall choose for special mention M Muhammad Musa, M Dhian Singh, M Fazal Elahi, M. Mehr Singh, M Lal Singh and Lala Nihal Chand Bajaj The last-named has been responsible for the preparation of the Subsidiary Tables, and is the last to leave His work has throughout been characterised by an exceptional diligence and thoroughness, and I am most thankful to him S Gurdial Singh both as Proof Reader and Inspector in the Compilation and Sorting Offices has done extremely valuable work The Head Clerk, Chaudhri Muhammad Said, is my oldest colleague At the outset of my work he was my only clerk for many weeks to deal single-handed with correspondence, typing, translating and accounts In September 1931 he was promoted to the post of Head Clerk, and has continued as such to the end He has discharged his duties throughout with the utmost diligence, and he has been a valuable asset Sheikh Abdul Wahid, the efficient Record-keeper in my predecessor's office, as third clerk and S Harnam Singh as Record-keeper have done very good work My second clerk and steno-typist, Pandit Rajindar Nath Kaul, has been with me for over two years and a quarter, and I have found him most useful throughout He has passed through numerous periods of great stress with an amazing amount of patience and cheerfulness, and his work has been simply invaluable

During the last three years I have had to make numerous references to the Punjab Government about various matters, and am much indebted for the kindness and consideration I have always received

In conclusion, I tender my deep gratitude to Dr Hutton, Census Commissioner for India, for the guidance and encouragement I have invariably received at his hands Whenever I was faced with a difficulty and sought his help his response was prompt and his advice invaluable It has been to me a privilege and a pleasure to have served under him

SECTION 1.—THE AREA DEALT WITH.

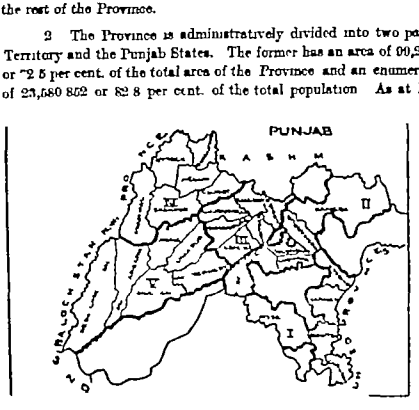

Introductory

1 This Report deals with the eighth Census of the Punjab, taken on the night between the 26th and 27th February 1931 A separate Report for Delhi Province, which has hitherto been treated in the Punjab Reports, has been compiled on the present occasion

The Province derives its name from its rivers (*Panj-ab* meaning five rivers) namely Sutlej Beas, Ravi Chenab and Jhelum, which traverse its length from north-east to south-west and join up with the Indus at Mithankot (in the Dera Ghazi Khan District) and thus along with it pour their waters into the Arabian Sea near Karachi. Four decades back it was the existence of the five rivers rather than their utility which conferred the name on the Province. Now those rivers do not merely exist in name but have been rendered a valuable asset by the engineer's skill, and all of them have to their credit magnificent canal systems which have brought fertilising water to millions of acres of arid land and thus provided livelihood for a considerable portion of the provincial population and have *brought into existence prosperous colony towns and flourishing villages*, built on modern lines with due regard to the laws of sanitation and cleanliness. The Beas is the smallest and the only river whose name is not directly associated with a canal but during the *kharif* it feeds an old private canal in the Hoshiarpur District known as Shah Nahr and after joining the Sutlej near Ferozepore its supply is utilized by the canals of the Sutlej Valley Project. At the last census, the Sutlej had only one canal, the Sirhind, to feed, but now it claims a most extensive canal system which irrigates large tracts in the Ferozepore, Lahore, Montgomery and Multan Districts and the States of Bahawalpur and Bikaner Thus the Punjab is now in reality a tract which in a way derives its life from those rivers, depending on them largely for its material prosperity Two other rivers, the Jumna and the Indus, also traverse the Province and form its boundaries on the east and west respectively The Jumna divides the Punjab from the United Provinces, and the Indus while forming the boundary line on the north-west runs through the Mianwali District and separates the Dera Ghazi Khan District from the rest of the Province.

Administrative Divisions.

2 The Province is administratively divided into two parts, the British Territory and the Punjab States. The former has an area of 99,280 square miles or 72 5 per cent. of the total area of the Province and an enumerated population of 23,580 852 or 82 8 per cent. of the total population As at last census, the British Territory is divided into 29 districts each administered by a Deputy Commissioner and these are grouped in five divisions, each in charge of a Commissioner The map in the margin shows the limits of the districts and divisions. The order in which the

Political Divisions.

I Ambala Division. II Jullundur Division. III Lahore Division
IV Rawalpindi Division. V Multan Division.

administrative divisions of the British Territory appear in the census tables and official documents is shown below —

Ambala Division	*Jullundur Division*	*Lahore Division*	*Rawalpindi Division*	*Multan Division*
1 Rohtak	7 Kangra	12 Lahore	18 Gujrat	24 Montgomery
2 Karnal	8 Hoshiarpur	13 Amritsar	19 Shahpur	25 Lyallpur
3 Gurgaon	9 Jullundur	14 Gurdaspur	20 Jhelum	26 Jhang
4 Kalka	10 Ludhiana	15 Sialkot	21 Rawalpindi	27 Multan
5 Ambala	11 Ferozepore	16 Gujranwala	22 Attock	28 Muzaffargarh
6 Simla		17 Sheikhupura	23 Mianwali	29 Dera Ghazi Khan.

The Punjab States have an area of 17,099 square miles and a population of 1,910,605 or 27·7 per cent of the total area and 4·72 per cent of the total population. The Simla Hill States are 27 in number, and their grouping remains as before and the Deputy Commissioner Simla continues to be their Superintendent. These and three others (Pataudi Kalsia and Dujana) have political relations with the Punjab Government, and 13 states have political relations with the Government of India through the Agent to Governor General. Their arrangement in the tables is shown below —

A—Having political relations with the Punjab Government	*B—Having political relations with the Government of India*		
1 Dujana	5 Loharu	12 Faridkot	
2 Kalsia	6 Sirmoor	13 Chamba	
3 Kalka	7 Bilaspur	14 Patiala	Phulkian States
4 Simla Hill States (27 states)	8 Mandi	15 Jind	Phulkian States
	9 Suket	16 Nabha	Phulkian States
	10 Kapurthala	17 Bahawalpur	
	11 Malerkotla		

This arrangement depends on the closeness of their relations with the Province and also on their geographical position, but not on the importance of their size or status. In the last Census Report Nahan appeared as the name of the Sirmoor State, as a matter of fact the name of the State is Sirmoor and Nahan is its capital. The map in the margin indicates the location of the various Punjab States.

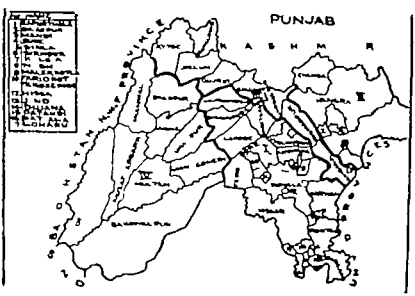

Punjab States

3. For a lucid presentation of certain derivative results, shown in the subsidiary tables printed at the end of each chapter of this Report, the Province has been divided into four Natural Divisions, as opposed to Administrative Divisions, with main reference to physical and climatic features. These are the Indo Gangetic Plain West, the Himalayan, the Sub-Himalayan and the North-West Dry Area. Their names are determined with regard to India as a whole, and do not

Natural Divisions.

necessarily define the areas merely in respect of their location in the Punjab For example the Indo-Gangetic Plain West does not only include a number of the districts and states of the Punjab but also the western districts of the United Provinces Similarly the North West Dry Area comprises some Punjab districts and Bahawalpur State as well as Rajputana Sind and Baluchistan. The above map shows the four Natural Divisions of the Punjab and the statement below indicates the districts and states situated in each division —

Natural Divisions.

I Indo-Gangetic Plain West *II Himalayas.*

46. Dera Ghazi Khan (*including the Biloch Trans-frontier Tract*).

The four Natural Divisions are the same as at last census. They have been retained unchanged for two main reasons. In the first place they have changed but little in their physical and climatic features since last census although canal irrigation in several districts of the North West Dry Area has revolutionized the economic conditions, particularly during the last decade or two and they now resemble more than ever some of the districts of the Indo-Gangetic Plain. In the second place any re-shuffling would have rendered the comparison of statistics with the past censuses very difficult if not an impossible task. The main characteristics of the four divisions are described below

Himalayas. It contains country on both sides of the outer range of the Himalayas. The lower slopes, valleys and foot hills are under cultivation There are many

fertile tracts here and there Irrigation is supplied by numerous mountain streams small watercourses being made by the cultivators to irrigate the valleys and lower slopes There is no dearth of grazing grounds and timber and fuel-wood are in abundance Climatically the Division is mild in summer and very severe in winter, the high mountains are covered with perpetual snows and early in winter many of the tracts become isolated from the rest of the world by wide barriers of snow and even postal communications cease The average annual rainfall for the last decade is 62 inches as compared with the corresponding figure of 9 inches for the North-West Dry Area The highest average (120 inches) is claimed by the Kangra District and the lowest (17 inches) by the Chamba State

Sub-Himalayan

This Division is the narrow strip of country adjoining the Himalayan, called sub-montane into which run some of the spurs of the Himalayas such as the Siwaliks and the high hills of Kasauli Dalhousie and Murree In some districts the lands in the vicinity of the foot hills are traversed by numerous hill torrents many of which lay a deposit of silt and add to the fertility of the soil The three northern districts of this Division are hilly in their character and for the most part composed of broken country In the other districts the greater portion of the area is a fairly level plain where depth to water is small and wells easy to sink except in Ambala The rainfall is fairly copious, the ten years' average for the Division is 41 inches the highest average being 37 inches (Kalka) and the lowest 21 inches (Attock)

Indo-Gangetic Plain West

This Natural Division like the North West Dry Area is the level alluvial plain of the Punjab The rainfall is less here than in the Sub Himalayan area and decreases from east to west Most of the districts and states receive a good deal of irrigation from perennial canals The units not receiving canal water, such as Jullundur District and Kapurthala State possess an extensive well-irrigation. The districts lying near the Rajputana border have for the greater part a sandy soil, a low water-table and very meagre well-irrigation For example, the portions of Hissar and Ferozepore Districts outside canal irrigation limits solely depend on rain for their crops The average rainfall is 20 inches the highest average being 27 inches (Karnal) and the lowest 16 inches (Ferozepore)

North-West Dry Area

The North West Dry Area differs from the Indo Gangetic Plain in having a smaller rainfall and a lower water table During the pre-canal period, i e, less than forty years ago, it was for the most part a vast expanse of arid waste and the haunt of pastoral people, but now claims to be one of the biggest granaries of the world The Districts of Lyallpur, Shahpur, Jhang, Montgomery and Multan and the State of Bahawalpur have benefited by several extensive canal systems which have steadily come into existence during the last four decades The rainfall factor has become negligible in the case of these districts, and in point of fertility they are now more than a match for the districts of the Indo Gangetic Plain Muzaffargarh and parts of Multan, Dera Ghazi Khan and Bahawalpur receive irrigation from a net-work of inundation canals In the riverains of Multan, Jhang, Muzaffargarh and Dera Ghazi Khan there is also considerable irrigation from wells The average rainfall for the Division is 9 inches the highest average being 15 inches (Shahpur) and the lowest 5 inches (Bahawalpur)

External Changes in Boundaries.

4 The boundary of the Province has undergone no appreciable change in the last decade, and the only external transfers of area, which are hardly of

any importance, have taken place with the United Provinces and the Bikaner State as noted below

Districts.	Tahsils.	Districts.	Tahsils.	Area in square miles.
From which transferred		*To which transferred.*		
Bulandshah (U.P.)		Gurgaon	Ballabgarh	62
Muzaffarnagar (U.P.)		Karnal	Karnal	16
Gurgaon (Punjab)	Ballabgarh	Bulandshahr		11
Ferozepore (Punjab)	Fazilka	Bikaner	Ganga Nagar	1

The first three changes were due to river action and the fourth to a fixation of boundaries.

Internal Changes.

3 There have been some minor internal changes of boundaries as noted below and it will be seen that only one transfer has occurred between British Territory and an Indian State and in other cases the transfer is from one British district to another

Districts.	Tahsils.	Districts.	Tahsils.	Area in square miles.	Remarks.
From which transferred.		*To which transferred.*			No. of Notification, Settlement of boundaries.
Kangra	Palampur	Mandi State			2510, dated 5-11-28.

18	Montgomery	5 456	5 470	13	Bahawalpur	16 434	16 003

It will be seen that the figures of total area from the two sources differ by 703 square miles In the case of 9 districts and states the figures tally In 13 the difference is less than 10 square miles, and in 8 less than 50 square miles, in each case Dera Ghazi Khan and Bahawalpur are conspicuous for a large disparity between the two sets of figures, and considering the vastness of their areas the hilly nature of the former and the desert conditions obtaining in a large part of the latter, there is nothing surprising if the latest survey has yielded different results

SECTION 2.—POPULATION.

7 Before referring to the statistical record of the census, either for the Province as a whole or its various divisions it will be well to define the precise meaning of '*population*' The "*Census*' or the "*Actual Population*' means all persons, except for the small number enumerated at non-synchronous census, who were enumerated as being alive and present in the Punjab on the night of the General.

26th February 1931 *It consists of residents, visitors and travellers, including* British subjects, subjects of Punjab states and foreigners." In other words, like all previous censuses, it means the *de facto* population or the aggregate of persons enumerated in an area.

In some tracts of the Himalayan Division, owing to their inaccessibility during winter on account of snow the census was held at dates ranging between the 5th September and the middle of December 1930 and in their case the population obtained is the *de jure* " population Similarly on account of the wild nature of the country or of the possibility of danger from wild beasts, in some parts of the Ambala and Gurgaon Districts and the Biloch Trans-frontier Tract of the Dera Ghazi Khan District, the final census was held during the day preceding the census night In order to prevent double enumeration the persons enumerated in the non-synchronous areas were given passes to be shown to the enumerators in case they moved out and happened to be on the final census night at places to be enumerated on the normal date

The practice of enumerating *de facto* population instead of *de jure* population is adopted even in the most advanced countries, such as Great Britain and America. It has the advantage of being simple, every person being enumerated wherever he happens to be at the given time irrespective of intricate considerations of birth place and domicile or permanent residence. The method of enumeration adopted in this country differs from that obtaining in some foreign countries in one respect. Whereas in those countries the duty of filling up the schedule devolves on the house-holder here it is undertaken for the most part by an enumerating agency The distribution of population at the time of the census *may thus appear to be accidental to a certain extent* but apart *from its being* simple this method yields a count not far removed from the normal or *de jure* population if the date of the census is fixed as it is done in India so as not to coincide with any occasion involving an abnormal movement of the people

The Census. 8 The date of the present census, though fixed with regard to India as a whole proved eminently suited to this Province. The movement of the people prior to the harvesting of the spring crops had not begun and only about half a dozen fairs in the whole Province coincided with the date of the census. Efficient arrangements for the enumeration of the persons present at these gatherings were made.

Though the population of various districts particularly of some large towns, varies *with the various times of the year* the figures in the Census Report may with certain reservation as in previous censuses be taken as figures representing the normal population The present census was taken about the end of February or three weeks earlier than in 1921 and the population of the Simla Town was, therefore less than it would have been if a count had been taken at a later date the people from Delhi had not moved up and some departments which were permanently stationed in Simla in 1921 were no longer there having their winter headquarters at Delhi. A special summer census, *held on the* 30th June 1931 showed that the town possessed 33,940 persons against 3,266 enumerated at the normal census

In addition to the terms mentioned above another term Natural Population" will be met with in certain subsidiary tables. It means the population of an area if there was no migration. Thus the Natural Population of the Province would be obtained by excluding all persons born outside but

enumerated in the Province and including all Punjab-born persons wherever enumerated outside the Province The complete figures for the latter, as was the case at past censuses are not available for all countries, where they may be residing at the time of the census The figures for a few countries are available, but in the case of others they became available too late for being used in the Report However, the great majority of persons who go out of the Punjab, only go to some provinces or states in India where a synchronous count is held, and so the defect is to a large extent unimportant

Provisional Totals

9 As soon after the census is possible the number of persons enumerated, male and female, together with the number of occupied houses is totalled up and "provisional totals" are published The provisional figures for the Punjab were reported to the Census Commissioner for India on the 6th March 1931 or a week after the census and they differed from the final figures only by 800, a variation altogether negligible considering the huge population and the vast area involved

Scope and Mode of Enquiry Questions Asked.

The questions asked of each individual at the census are simple and not many They relate to religion and sect sex civil condition i e, whether a person is married unmarried or widowed age and caste, whether earner or dependant, if an earner, his or her principal occupation as well as a subsidiary occupation, if any, and if a working dependant, his or her occupation, if employed in an organized industry, its nature, birth-place mother tongue and other languages habitually spoken in addition to the mother tongue whether literate or illiterate, and in case literate, name or names of the vernaculars in which literate and whether *primary-passed or not* whether literate in English and last of all whether deaf and dumb blind, insane or leprous The reply to all these questions was recorded by enumerators in general schedules the bulk of which was printed in Urdu An attempt was made on the present occasion to enumerate the Europeans and Anglo Indians wherever they happened to be numerous, on the general schedule, and so English knowing enumerators were employed and supplied with general schedules in English This was undoubtedly a better method to ensure entries according to instructions because however clear the instructions they can be interpreted properly only by a trained staff Household schedules were therefore, issued only in special cases The facsimile of the general schedule reproduced below will give a clear idea of the questions asked

GENERAL SCHEDULE

Name of thana (Tahsil, etc) *Name of Village / Town* *No of Charge*

No of Circle *No of Block* *Page*

House No	Serial number of person	Name	Religion and sect	Male or female	Married unmarried or widowed	Age	Caste tribe or race	Earner or dependant	OCCUPATION OR MEANS OF SUBSISTENCE OR ACTUAL WORKER — Principal	Subsidiary	(For organized workers) The industry in which employed	Birth district (or country)	Mother tongue	Other languages habitually spoken	Literate or illiterate	Whether literate in English	Insane, deaf mute, totally blind, leper
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

Special Enquiries

In addition to the particulars collected in the general schedules, special schedules to ascertain the extent of educated unemployment were distributed among persons, who were matriculates or possessed a higher educational qualification and were unemployed and wishful for employment The enumerators were instructed to hand over the schedules to such persons in the course of

preliminary enumeration and collect them on the final census night. The response to the enquiry was however very poor and the results are printed in a table at the end of Chapter VIII (Occupation). It was not considered worth while to print them, as originally intended in Part II of the Report, which contains the Imperial Tables

A special enquiry was also made with a view to obtain statistics about the size of families in typical areas of each district and state, and the particulars in regard to all families with both husband and wife alive were obtained in regard to occupations, castes, duration of marriage and the age at which the wife was married together with the number of children born and surviving and the sex of the first-born child The results are discussed in Chapter VI on Civil Condition.

Scope of Census Enquiry

There is no gainsaying the fact that the questions asked at an Indian census are only few when compared with the number of questions asked at the time of census in some of the foreign countries. At a census of the United States of America held as far back as 1840 an attempt was made to collect information with regard to mines, agriculture commerce manufactures and schools, and thus to obtain statistics about the resources of the country industries, education etc. This tendency has grown during the subsequent period and questions having no essential or necessary connection with the main purpose of a census have continued to be put in ever-increasing numbers. As a matter of fact the original census held in the United States was merely intended to secure an accurate enumeration of the population as a basis for re-apportionment of seats in the House of Representatives. In 1830 IX schedules were employed one for free citizens, one for slaves, one for deaths during the preceding year one for agriculture one for manufacturers, and one for social statistics.

The census of Canada follows the lines of the United States and no less than eleven sch dules are employed most of them relating to the details of industry and production nature of employment, wages earned and various other particulars. In consequence of the large amount of immigration to Canada, minute enquiries are also made with regard to the birth place of parents nationality and naturalisation Thus over 330 questions have to be answered by each individual and so intricate a work is not left to the house-holder but is undertaken by a special agency

A definite limit has to be put to the number of questions at the time of census in India, owing to several circumstances peculiar to it. A synchronous count of such a large population spread over vast areas has to be taken within a short space of time and the chief difficulty is the lack of sufficient number of intelligent enumerators, who could conduct an intricate enquiry in a uniform manner The scope of the work, however is being slowly increased and as the people become more familiar with the census and its objects—they have already ceased to be indifferent to it—more elaborate enquiries will be possible in the future The questions asked though comparatively few cover all the vital matters of general int rest, and the results obtained have been tabulated in the form of 18 Imperial Tables printed in Part II of this Volume At the end of each Chapter in this Part will be found about half a dozen subsidiary tables giving results derived from the Imperial Tables or from information collected from other sources. Any departure from the previous censuses in the matter of the questions asked will be explained at its proper place in a subsequent Chapter

It is not necessary here to go into the details of abstraction and compilation of the statistical material, nor to describe the difficulties that were met with

or the manner in which they were overcome That will form the subject of a separate volume It will suffice to say here that the slip system of orting was again resorted to, and the work of compilation done at one central office for the whole Province except that of the Patiala Nabha, Jind and Bahawalpur States, which carried out their own compilation and sent only the summary figures to the Central Compilation Office Various methods to improve the work of extraction and tabulation have been carefully studied and explored The use of automatic sorting and tabulating machines such as those used in the tabulation of statistics in some of the countries in the West, had to be rejected as being too expensive and elaborate A process, which seems economical on the face of it, is to make a record of individuals straightaway on slips suitable for sorting and thus eliminate the filling-up of schedules and copying of the entries on the slips The chief objection to this method, however, is that the classification made by enumerators will in numerous cases be haphazard and unreliable, and it will not be possible to have the doubtful cases verified by the supervising agency as is feasible in the case of the schedules

SECTION 3.—AREA, POPULATION AND DENSITY.

Density

10 The Punjab with an area of 136,964 square miles and a population of 28,490,857 has a density of 208 persons per square mile The British Territory has an area of 99,265 square miles and a population of 23,580,852, which give a density of 238 In the case of the Punjab States, which have an area of 37,699 square miles and a population of 4,910,005 the density is 130 The States of the Punjab Agency have an area of 32,407 square miles and a population of 4,472,218

The Punjab in respect of area is the fourth province in India the first three being Burma, Bombay and Madras In point of population and density, it is sixth and fifth, respectively, among the provinces It is slightly smaller in size than the Republic of Poland, which has an area of 150,000 square miles and an estimated population of 32,150,000 (on the 31st December 1930) The number of persons per square mile in Poland is thus 214 which is about the same as in the Punjab

The Republic of Ukraine, according to the 1926 census, has a population of 29,020,304, or about half a million more than that of the Punjab, and an area of 174,201 square miles or about 30 per cent in excess of the Punjab the density being 166 per square mile

The area of the British Territory of the Punjab is nearly equal to that of the United Kingdom, which is 94,208 square miles The population of the United Kingdom (46,077,000) according to the 1931 census is, however, nearly twice as much, which gives a density of 489 per square mile The population of the British Territory is also comparable to that of Spain including the Canaries, which according to an estimate made in December 1931 was 23,581,000 The area of Spain is 194,208 square miles or nearly twice as large as that of British Territory, and its density (121) is thus about one-half

The Punjab States are comparable to Ireland in point of density In 1926 Ireland had an area of 32,531 square miles and a population of 4,228,553, the density being 130 per square mile or exactly the same as that of the Punjab States

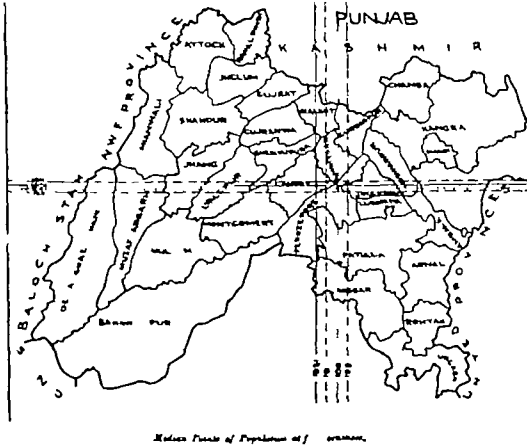

Comparison with Foreign Countries.

The table on the next page compares the latest figures of area, population and density of some of the principal foreign countries with those of the Punjab.

Country.	Area in square miles.	Population according to the last census.	Density per square mile.	Country	Area in square miles.	Population according to the last census.	Density per square mile
1		3	4	1	2	3	4

Japan	147 490	64 705,000	439	Switzerland	15,990	4,077,000	264
Persia	627 790	8,000,000	14	Sweden	172,973	6,162,000	36
EUROPE				OCEANIA			
United Kingdom	94,208	46,077,000	489	Australia	2,974,514	6,476,000	2
England and Wales	58,301	39,846,000	686	New Zealand	103,478	1,806,000	18

The Median Point of Population.

The map below shows the median point" of population for the present census and for the censuses of 1911 1901 and 1881 This point is a numerical centre and if horizontal and vertical lines are drawn through it, each

Median Points of Population of [illegible] censuses.

of them will divide the population of the Punjab equally into two parts It is noteworthy that the median point has moved westward, indicating that the population of the North-West Dry Area has made long strides during the last three decades as a result of the various colony schemes

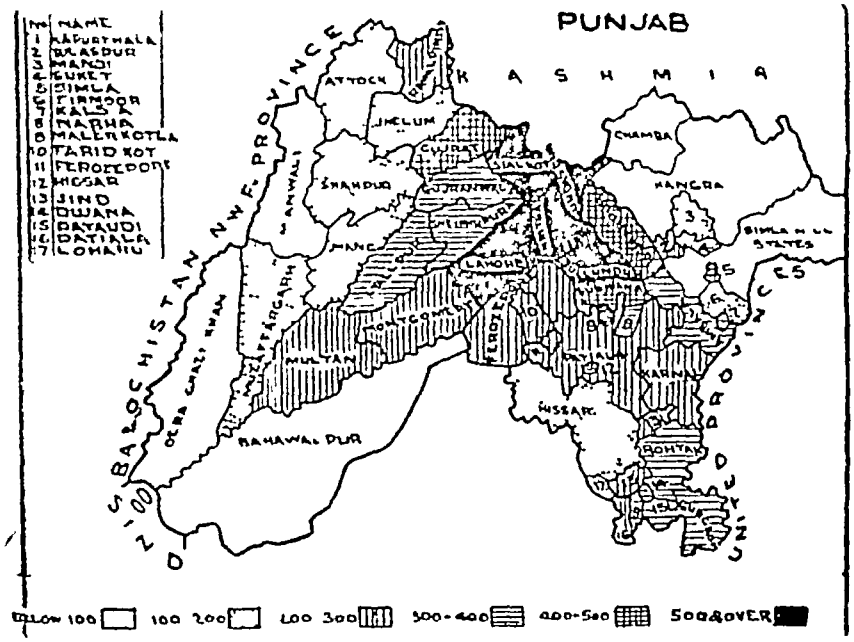

11 The marginal table shows the area and population as well as the density per square mile of the different administrative divisions of the Province The Multan Division with an area of 31,805 square miles is the largest in extent, but the Lahore Division with a population of 5,879,075 is the most populous Of the Punjab States those having political relations with the Government of India are the most extensive as well as the most populous

Density in Administrative Divisions

Division	Area	Population	Density
Ambala	15,013	4,077,565	272
Jullundur	18,512	4,606,446	244
Lahore	12,217	5,879,075	481
Rawalpindi	21,388	3,914,849	183
Multan	31,805	5,102,917	160
Punjab States	37,699	4,910,005	130
A—Having political relations with the Punjab Government	5,292	437,787	83
B—Having political relations with the Government of India	32,407	4,472,218	138

12 The density of the Province varies widely in its different parts, and the variation is undoubtedly due to the difference in ability of each to support the population The resources and the pressure of population will be discussed later on after we have examined the conditions obtaining in different parts of the Province in the past, but it will be better at this stage to show the distribution of the population in the various parts of the Province by means of a map which appears in the margin It can be seen at a glance that the greatest density exists in the central districts, and that the north-west of the Province is sparsely populated, as also the Hissar District in the south-east On the north-east, Kangra, Chamba and Simla Hill States have a density below 100 owing to the hilly nature of the country On the south-west, Bahawalpur has a very low density owing to its huge area, containing many sandy and bare tracts, which are thinly populated, but it is gaining ground as a result of canal-irrigation

Density in Districts and States

Number of persons per square mile in Census 1931

In the following table the density figures relating to colony districts and Bahawalpur State are compared with those of the pre-canal period to show how rapidly the population rises when large tracts lying waste are brought under the plough.

Statement showing the density figures for certain districts

SECTION 4.—VARIATIONS IN POPULATION

First Censuses.

13 As remarked at the outset this Report deals with the 8th census taken in the Punjab The dates of the censuses with the name of the officer deputed to superintend the operations and the territory concerned are noted below —

Date.	Superintendent	Territory
1st January 1855	Sir Donald McLeod	British Territory only including the present Punjab and the North-West Frontier Province but omitting Delhi, Hissar Rohtak, Gurgaon, and part of Karnal.
10th January 1868	Mr A. Roberts	British Territory only including the present North-West Frontier Province Punjab and Delhi.
17th February 1881	Mr D J Ibbetson	British Territory and the Punjab States, the former including the same territory as in 1868.
*6th February 1891	Mr. E. D Maclagan	The same territory as in 1881
1st March 1901	Mr H. A. Rose	The same territory as in 1891 but with separate statistics for (1) the Punjab including Delhi and (2) the North West Frontier Province
10th March 1911	Pandit Hari Kishan Kaul, B.B., C.I.E.	The Punjab including Delhi and the Punjab States
18th March 1921	Mr L. Middleton	The present Punjab and Punjab States with separate statistics for Delhi.
*6th February 1931	Khan Ahmad Hasa Khan, K. B.	The present Punjab and Punjab States

The early growth of the population of the Province under British rule was chiefly due to the increased security and later on to improved means of production as a result of the opening of the canal colonies and the extension of the means of transport and marketing A contributary cause was also the greater accuracy

attained at each succeeding census and admittedly the census of 1881 was more accurate than those of 1855* and 1868 †

Before we attempt a comparison of the present figures with those of past censuses it is essential to take into account the changes in area that have taken place The population to be shown for past censuses must be the population of that territory which now constitutes the Punjab In 1881 the population of the Punjab was so adjusted for the two earlier censuses, the adjusted figures being accepted in 1891 In the succeeding censuses the population was adjusted as more changes took place, the most notable being the separation of the North-West Frontier Province from the Punjab in 1901 and more recently the creation of the new Province of Delhi in 1912 Mr Middleton in 1921 revised the figures of 1855 and 1868 once again in the light of the transfers, and as there have been no changes worth the name during the last decade, we may accept his figures as approximately correct At the two censuses of 1855 and 1868 the Punjab States were not enumerated and only an estimate of their population was made in 1855 This estimate after adjustment gives their population for that year as 3,750,606 We can thus accept the population shown below as that of the present Punjab at the various censuses

As shown	18	1868	1881	1891	1901	1911	1921	1931
Adjusted figures								
British Territory	17,811,180	17,708,606	16,939,312	18,652,614	19,912,716	19,679,016	20,685,478	23,680,852
Punjab States	3,750,606		3,861,983	4,263,280	4,424,395	4,212,791	4,416,036	4,910,005
Annual rate of increase per cent

Punjab States			0·11	1·01	0·38	−0·48	0·48	1·1

Variations in Population (1855—1921). 1855—1868

11 The period 1855—1868 shows for the British Territory an annual increase of 1·09 per cent which is the biggest excepting the increase during the last decade The increase in population was evidently due to peace and security which had been strangers to the land for more than a century past, and perhaps the rate of increase became more pronounced owing to a greater accuracy of enumeration attained in 1868 However the fact remains that the natural increase was considerable The cultivated area increased during the intercensal period by no less than 32 per cent The irrigation from the Western Jumna Canal, the only perennial canal in existence in 1855, rose from 625 to 750 square miles, to which might be added 170 square miles irrigated from the Bari Doab (now known as Upper Bari Doab) which had been opened in 1860 The Railways Posts and Telegraphs were also making steady progress

1868—1881.

The period, 1868—1881, was one of even more marked peace and progress, but the great rise in population, which characterised the previous intercensal period, was *not maintained*, the annual rate of increase being 56 per cent The maximum population during this intercensal period was evidently reached in 1878, after which a decline set in owing to the last three years being characterised by scarcity and sickness The development of metalled roads and railways went ahead at a good pace, and in 1881 their mileage was 146 and 1,056, respectively Progress was made in sanitation and the number of patients treated at Government dispensaries rose from 471 to 1,368 thousands The number of children in schools more than doubled, and great advance was noticeable in

* For a Report of this census see Vol XI, Government of India (Foreign Departments) Selections
† Report on the census of 1868 by Mr Miller, Secretary to the Financial Commissioner, Punjab

Posts and Telegraphs. The cultivated area increased by 17 per cent. and the canal irrigated by 19 per cent.

1881—1891. During the decade 1881—1891 the increase in population was again rapid, and the annual rate of 1·01 per cent. is the third highest recorded so far. The area under cultivation increased by about 10 per cent., as compared with the corresponding figures of 32 and 17 per cent. for the two preceding intercensal periods. The material progress other than agricultural was however considerable and to this fact and to the absence of any famine the large rise in population, during this decade is mainly attributable. A census of the Punjab States was taken in 1881 for the first time, and in their case the annual increase during the decade was 1·04 per cent.

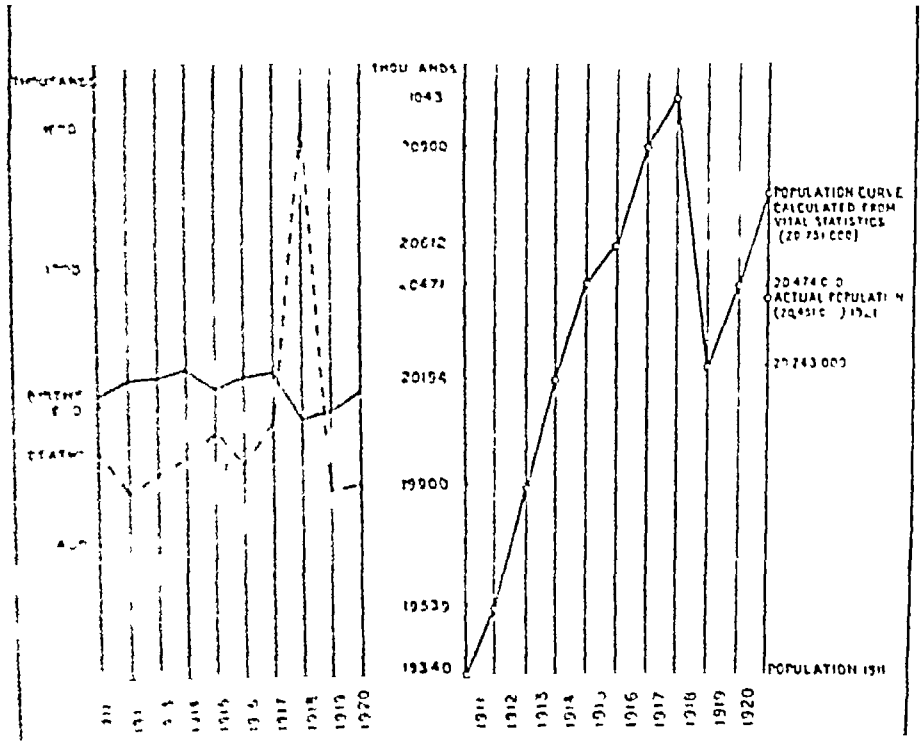

1891—1901. The average rate of increase during the decade 1891—1901 was 09 for British Territory and 38 for Punjab States. The disparity is mainly attributable to the development of canal irrigation in British Territory as a result of the opening of the Lower Chenab Canal. The cultivated area rose by 10 per cent. and the canal irrigated by 64 per cent. The rate of increase in population slowed down very much in the states and the districts in the east of the Province, and there was migration from Patiala to the Punjab districts. The year 1802 was the most unhealthy cholera having caused a record mortality and fevers also being responsible for high death-rate. The decade was free from famine but the south-eastern districts experienced a great scarcity. The improved means of transport, however were a relieving factor and the affected districts were therefore enabled to record a fair rate of increase in population.

1901—1911. The decade 1901—1911 was characterised by a prevalence of widespread disease. An epidemic of plague of great virulence coupled with fever of specially fatal type contributed to a death rate which exceeded the birth-rate in all the years of the decade except three 1906, 1909 and 1910 and in one year (1907) it reached the extraordinary figure of 62·1 *per mille* mainly owing to the unprecedented mortality from plague which caused 608 685 deaths. In the following year (1908) the death rate amounted to 50·" fevers " being the main cause. The excess of deaths over births during the decade was 557 447 the total deaths from plague being over two millions in British Territory alone. The loss of female lives was appalling, and the female population for the Province was considerably in defect at the census of 1911 there being 817 females per 1 000 males in that year as against 834 in 1901. Considerable material progress was made in spite of the adverse conditions, and the Lower Jhelum Canal, opened in 1901 was irrigating an area of 1 160 square miles of what was previously a barren tract. The area irrigated by the Lower Chenab Canal increased by 602 square miles and 1 105 miles of new railway lines were opened. The decade was also marked by steady industrial progress, and prices and wages were higher than in the previous decades.

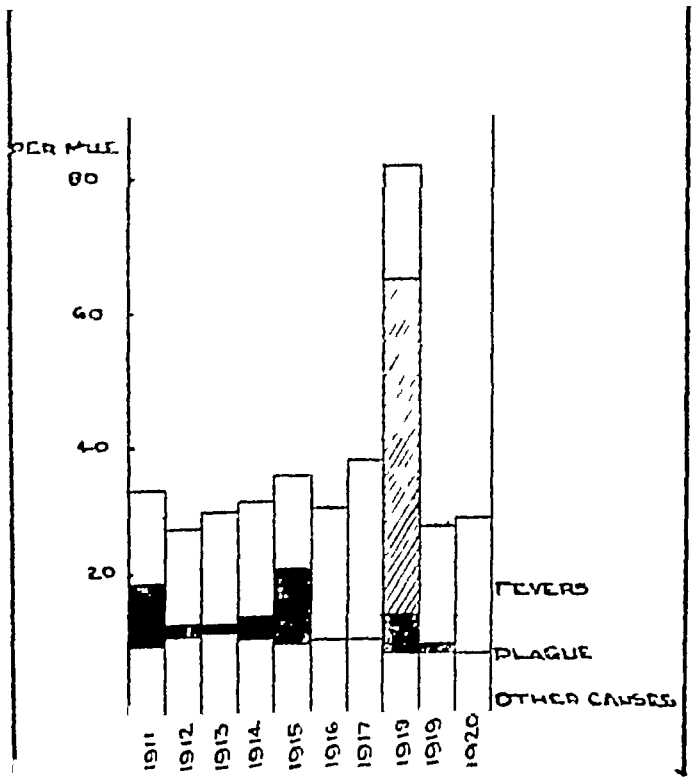

Conditions of the Previous Decade 1911—1921. 15. The annual rate of increase in the decade 1911—1921 was 57 in British Territory and 48 in the Punjab States. The decade was healthy for the most part, but the year 1918 made all the difference. During that year the influenza epidemic, which came in several waves during August and September assumed a terrible aspect in October and within a few weeks accounted for a little less than a million deaths in British Territory alone. The decade will also remain memorable because of the Great War which raged during four of its ten years and was responsible for a death roll of 12 794 a number too small to affect the population to any appreciable extent. The districts which contributed the greatest number

of combatants were Rawalpindi Jhelum Gujrat and Rohtak, each of which had more than 25,000 persons serving in the army, and in the number of troops contributed by the Punjab States Patiala's share was 50 per cent

The diagram given below shows for British Territory the number of births and deaths together with population figures for each year, based on vital statistics It is evident that the population kept rising each year and was at its maximum in 1917, but was brought down violently in the following year by the influenza epidemic

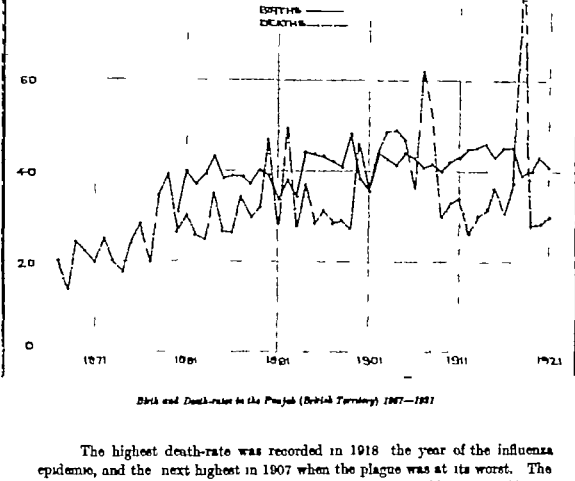

Births, Deaths and Population curve calculated from vital statistics, 1921

Death-rate by main diseases (1911—20)

The diagram in the margin shows the deaths from main causes for each year of the decade, the deaths due to influenza have been shown by the shaded portion of the rectangle for deaths due to fevers for the year 1918

In the Punjab the registration of deaths dates back to 1867 and that of births to 1880 The following diagram will indicate how these rates have fluctuated up to the end of the previous decade i.e., 1921

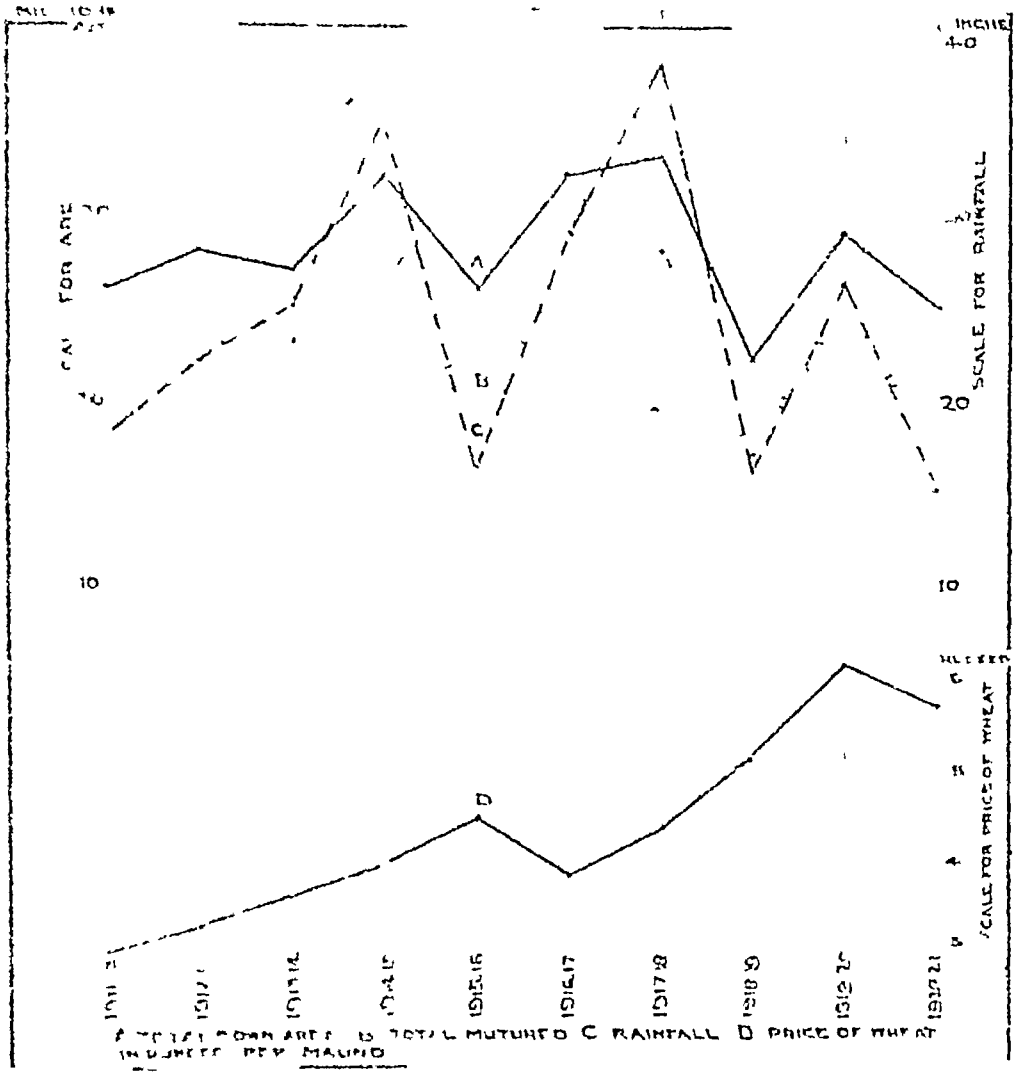

Birth and Death-rates in the Punjab (British Territory) 1867—1921

The highest death-rate was recorded in 1918 the year of the influenza epidemic, and the next highest in 1907 when the plague was at its worst. The birth-rate sinks low during a year following the period of any widespread epidemic but regains its former level or even rises higher soon afterwards. It was one of the lowest in 1891 and 1893 following the years, 1890 and 1892 during both of which fevers took a heavy toll, the latter year being also characterised by the record number of deaths from cholera In 1894 the birth rate went up to an unprecedented figure and five years later it rose still higher Another year remarkable for its low birth rate was 1900 which followed 1907 referred to above as the plague year and 1908 when mortality from fevers was very heavy A year or so later the birth rate made a recovery and kept up a high level till 1917

The decade may be described as a healthy one with the exception of the year of influenza In a series of particularly good years 1915 and 1910 stand out as less healthy than the rest owing to epidemics of plague and fevers respectively Consequently the birth rate was high except in 1918 when it dropped to an exceptionally low figure and though it improved in each of th subsequent years, it failed to reach its former level.

The Triple Canal Project, consisting of the Upper Jhelum th Upper Chenab and the Lower Bari Doab Canals was completed during the decade and by 1920–1 the three canals were irrigating 2,811 square miles.

The diagram below shows the total sown and matured areas, rainfall and the prices of wheat prevailing during the decade

The prices began to rise suddenly due to failure of crops in 1915-16 and as a result of War conditions after 1917 The rise was so rapid that the economic system of the country could not adjust itself to it The strain on the railways resulted in a dislocation of communications and markets Towards the end of the decade prices came to be determined by the law of local supply and demand, and coupled with further failure of harvests in 1918-19 and the terrible loss of life caused by influenza, the conditions became very favourable for the mischievous propaganda against the system of Government to take root Open disorder in the Province had to be put down by force in the spring of 1919 and left a legacy of racial feeling and industrial unrest, resulting in strikes and further dislocation of industry Good harvests of 1919-20 were unable to relieve the situation and the prices continued to rise, and with the general failure of crops in 1920-21 an unprecedented situation was created The price of wheat exceeded Rs 6 per maund or more than doubled since the beginning of the decade, the result being that wheat was actually imported into India from Australia in spite of the heavy freight charges With the rise in prices the wages also showed an upward tendency, although after 1917 they did not keep pace with the tremendous rise in prices

Owing to the War and financial stringency there was little extension in the Railway communications of the Province Only 487 miles of new Railway

branch lines were opened during the decade and the doubling of the line from Ambala to Lahore and from Lahore to Raewind was completed

The mileage of metalled roads rose from 2,019 to 2 037 The old railway bridges over the Sutlej and Beas were converted into road bridges and a road bridge was constructed over the Ravi and another over the Chenab near Wazirabad. A great deal of improvement was thus effected on the Grand Trunk Road, but all the same road communications were far less extensive than the railway system of the Province.

Prominent among the public works carried out during the decade was the construction of the Nammal Dam in the Mianwali District which provided irrigation to 8 000 acres of cultivable land.

SECTION 5 —CONDITIONS OF THE LAST DECADE.

General. 10. We shall now examine the conditions of the last decade at some length confining our attention to those facts, which have a possible bearing on the movement of the population.

We have noticed in the last section how the end of the previous decade (1911—21) witnessed a combination of adverse circumstances on an unprecedented scale The unrest then prevalent was not peculiar to this Province, but had a world-wide range as an aftermath of the Great War.

Inauguration of Reforms. The last decade will ever remain memorable for more events than one The Province was honoured early in the decade by a visit of His Royal Highness the Prince of Wales, to be soon followed by the inauguration of an era of reforms introduced by the Government of India Act of 1919 Just before the census of 1921 the Punjab had been raised to the status of a Governor s Province with a cabinet consisting of two Members and two Ministers, of which the latter were to be selected from amongst the elected members of the Legislative Council, which had 71 members elected by the people and 20 nominated by Government The first session of the Legislative Council was held on the 20th January 1921 The members soon set about their task in a right spirit and the Council has earned an enviable reputation among provincial legislatures for the dignity of its proceedings and a high sense of responsibility

The inauguration of the reforms, however did not bring about general or marked improvement in the political situation of the country The non-co-operation movement which had been launched after the events of 1919 was pushed on in the first two or three years of the decade It included a boycott of Government and aided schools of foreign cloth and of service in the Military and Police Departments The programme also included the establishing of Congress committees and *panchayats* in all important towns and villages and the organisation of a volunteer corps A few national schools were opened but as a rule closed down after a brief career

In the ranks of *khilafatists* disillusionment came as a result of the hardships which the *muhajirin* (emigrants) underwent in the autumn of 1920 when the Afghan authorities refused to admit any more of them into their territory Among the Sikhs, agitation of a somewhat different nature was kept alive by the extremists who urged the transfer of the control of the Golden Temple and the Khalsa College at Amritsar as the foremost demand of the community The body called Shiromani Gurdwara Parbandhak Committee " was formed with the avowed aim of taking over the management of all the Sikh shrines.

The Akali Dal, organised by this Committee, grew to large proportions and began the seizure by direct action of Sikh shrines and *gurdwaras* In February 1921 an attempt was made to seize the Nankana Sahib shrine by weight of numbers in defiance of the Mahant The Mahant's men opened fire on the intruders and about ninety persons were killed and the military had to restore order

The prevalence of crime and unrest at the end of the previous decade was partly due to demobilization as well as to political and economic causes In 1922, however, the situation improved A year later there was further improvement in the economic conditions, which was reflected in the reduction of minor crimes against property The wages maintained a high level while the prices of foodstuffs went down considerably There was, however little or no diminution in the volume of serious crime and a state of lawlessness, partly the outcome of a contempt for authority largely fostered by the Akali aggressiveness, continued to render life and property insecure, particularly in the central Punjab An increasing boldness and brutality was noticeable in the commission of violent crimes, exemplified in the savage murder of loyalists in the Jullundur and Hoshiarpur Districts by the Babbar Akali gang

The enactment of the Sikh Gurdwaras Act in July 1925 and the release of those, who had been convicted in connection with the Akali attempt to seize religious institutions by direct action, eased the situation and the agitation which had disturbed the peace of the Province for several years subsided

In the very first Legislative Council the members began to organize themselves into parties and there was an embryonic grouping of members according to rural and urban interests The other interests, notably communal, were not slow to awaken, and in 1927 the post of a third Minister was created to enable a Minister drawn from each of the chief communities to be included in the cabinet The spirit of communal antagonism, fanned by the activities of such movements as the "*shuddhi* (conversion to Hinduism) and "*tanzim*," (organisation of Muslim community to combat *shuddhi*), manifested itself in the serious communal riot at Multan in 1922, followed in 1926 by even more serious riots in Rawalpindi City and a neighbouring village A new and deplorable incident, typical of the period, occurred at Lahore in 1926, when some hooligans threw a bomb in the crowd of harmless spectators returning after witnessing the celebration of the Dusehra festival, killing many **Communal Conflict**

At the end of the year, Swami Shardhanand, a leader of the "*shuddhi*" movement, was murdered in Delhi by a Muslim, and this together with the agitation arising from excitement consequent on the judgment in the "*Rangila Rasul*"* case kept the atmosphere surcharged with mutual distrust and resentment Matters came to a head when in May 1927 a riot broke out in Lahore, causing several deaths, followed by communal riots in Multan on the occasion of the Muharram procession The scene of these activities was transferred to another part of the Province during the concluding years of the decade, and in 1928 there were serious riots at Softa in the Gurgaon District and at Malikpur in the Ambala District as a result of disputes over cow-slaughter on the occasion of Bakr-Id

The close of the decade witnessed a revival of the political agitation, which had been a feature at its commencement The agitation started with the announcement of the personnel of the Indian Statutory Commission, in which the **Civil Disobedience**

* A Hindu book seller of Lahore was prosecuted for publishing a book (*Rangila Rasul*), defamatory of the Prophet of Islam He was convicted and sentenced, but on appeal acquitted by the High Court Subsequently he was murdered by a Lahore Muslim

absence of Indian representatives was resented by a section of the public At the same time the country was drifting towards an economic depression. In 1928 as the result of a widespread revolutionary conspiracy Mr Saunders a young Assistant Superintendent of Police was shot dead at Lahore in broad daylight when leaving his office and a head constable was also murdered when pursuing the assailants. Two years later an attempt was made on the life of the Governor of the Punjab when a Hindu youth opened fire on him with a pistol as he was leaving the University Hall after presiding over the Convocation. The proceedings of the judicial trials of those involved in revolutionary conspiracies were given great prominence in the vernacular press. The activities of the Congress in this Province received a fillip by the holding of its 44th session in Lahore during the Christmas of 1929 when a resolution of complete independence was passed The civil disobedience movement was started in the spring of 1930 and an attempt was made in many places to break the salt laws. Later in the year Government took strong action against the law breakers, and numerous Congressmen were arrested. Some of the prominent Indian politicians were invited during the winter to a Round Table Conference in London. The Congress, however declined to participate. Early in 1931 the Congress leaders were released and soon after as a result of negotiations between the Government of India and the Congress a pact was concluded, under which the Congress called off the civil disobedience and Government released all political prisoners except those convicted of violent crime. Thus the decade ended as it had begun with the political situation being a dominant feature in the country

Health Conditions.

17 The principal features of the decade, 1931—30 so far as they bear on the general health of the people and affect the birth and death rates, are described below year by year The figures relate to British Territory only

1931.

The year 1931 was healthy though it did not come up to 1920 in this respect. The death rate (30·1) was low but it was slightly in excess of those of the previous two years, which was largely the result of a widespread epidemic of cholera which was the highest on record since 1900 coupled with localised epidemics of malaria in areas where the monsoon conditions had been favourable The fever death rate was the highest of the death-rates and exceeded the rate of the previous two years. The birth-rate (41 3) was lower than that of the preceding year

1932.

The year 1932 was an exceptionally healthy year in the Punjab The total death rate (23 07) from all causes was lower than it had been since 1878 and considerably lower than the quinquennial average (39·2). Only two provinces Madras and North West Frontier Province, reported a lower death rate for 1932. Rainfall was timely and the meteorological conditions were unfavourable to the spread of the disease. The only epidemic disease which assumed alarming proportions during 1932 was plague, which caused 7 837 deaths as against 2 896 in 1931 Even so the outbreak was considerably less severe than that of 1910 when the total number of deaths from plague approached 13 000 No other cause of mortality showed an increase The birth-rate was 30·3 showing a decrease of 2·2 per mille as against the figure for the previous year

1933.

The year 1933 was a year of good harvests and low prices but was considerably less healthy than the year 1932. Heavy winter and spring rain favoured the spread of plague and a slight excess in the monsoon rainfall was responsible for an increase in the mortality from fevers. The year was, however relatively healthy and the death-rate (30·91) was lower by 0·4 per mille than the quinquennial average but it was higher than that recorded for other provinces in India.

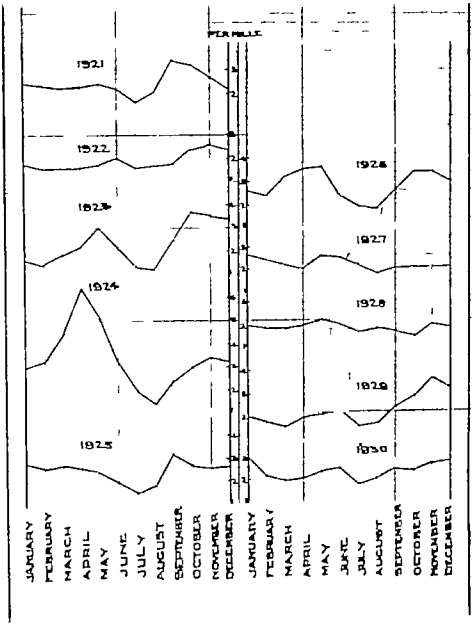

During 1923 the birth-rate rose to 43 2 *per mille* as against 39 3 *per mille* for the year 1922 This figure is the highest recorded for any province in India with the exception of the Central Provinces for which the birth-rate stood at 45 63

Annual Birth and Death rate (1921—30), *and deaths according to causes.*

Of the chief diseases prevalent during the year were plague and fevers with a total death-rate of 2 44 and 20 49, respectively The latter included relapsing fever which was prevalent in an epidemic form more especially in the western Punjab In Muzaffargarh District it was particularly severe and caused 6,207 deaths during the year The year 1923 marks the re-organisation of the Public Health Department in the Punjab

1924. After 5 relatively healthy years the year 1924 was characterised by extreme unhealthiness, the death-rate being 43 43 which is four times that of the United Kingdom and 16 08 *per mille* in excess of the provincial death-rate during the preceding five years The rainfall and climatic conditions were eminently favourable for the spread of the disease and the main cause of the abnormal death-rate was plague and fevers, the figures for which were 11 48 and 3 65 *per mille* respectively, above the quinquennial averages But the high death-rate was associated with a high birth-rate, the provincial figure being 40 1 *per mille* as compared with an average birth-rate of 40 5 during

Monthly death-rate per mille of total population for period 1921—30

the preceding quinquennium. Owing to the high death-rate there was an excess of 69,341 (3·3 *per mille*) of deaths over births—a circumstance which necessitates the statement that in the year 1924 the state of the public health was far from satisfactory

1925. The year 1925 in spite of unfavourable climatic conditions, was relatively healthy There was no undue prevalence of epidemic diseases and the distribution of the monsoon rainfall, which was above normal, was unfavourable to malaria. The death-rate was not only 13·4 *per mille* less than the rate of the previous year but also less than the average for the previous quinquennium. The Punjab continued to occupy the position of having the high birth-rate and a greater excess of births over deaths (10·1 *per mille* of the population) than any other province of India. There was, however no variation in the birth-rate for 1925 over the figures for the previous year

1926 During 1926 the death-rate at 36 52 per thousand was 5 21 higher than the average of the previous five years Rainy and cloudy weather in March, April and May and the consequent continuance of low temperatures and humidity provided ideal conditions for the spread of plague which was responsible for the loss of over 108,000 lives There was practically no cholera but a widespread epidemic of small-pox caused about 17,600 deaths, and the "fever" death-rate, owing chiefly to an epidemic of malaria in the last four months of the year, was higher than in the previous year and also exceeded the average of the last five years On the other hand the birth-rate—41 6 per thousand—was also higher and was exceeded in no other province in India except the Central Provinces

1927 The year 1927 was one of the healthiest years in the history of the Punjab, largely owing to meteorological conditions which were unfavourable to plague in the spring and to malaria in the autumn An epidemic of cholera of unusual intensity, however, prevailed chiefly in Kasur town and tahsil and in the Ferozepore District which took a toll of 11,286 lives The death-rate of 27 46 *per mille* was 9 06 *per mille* less than in 1926 and 5 13 less than the average of the previous five years In fact in only two years in the present century has the provincial rate been lower At the same time the birth-rate of 42 3 *per mille* was slightly higher than in the previous year The infantile mortality rate was also unusually low, the number of deaths among infants under one year of age being 167 5 per 1,000 births as compared with 203 43 in 1926

1928. In no previous year since vital statistics became available have the people of the Punjab enjoyed such remarkably good health as in the year 1928 As a result of the timely and well distributed rainfall the year 1928 was the healthiest in the decade, the birth-rate being 46 30 which was the highest and the death-rate 24 72 which was the lowest except for 1922 The main cause of the low death-rate and the high birth-rate was the remarkable freedom from epidemics and more especially the exceptionally low incidence of plague and malaria The general healthiness of the year was, however, marred by a very sharp outbreak of cholera in the Kulu Valley (Kangra District) where 1,746 seizures and 1,164 deaths occurred, over 70,000 anti-cholera inoculations being performed by the Public Health staff

1929 The distribution of the monsoon was unusual, the dry western districts of the Province had abnormal rainfall while it was in marked defect in the south-eastern part The monsoon started late and stopped early The rainfall was particularly heavy during the second fortnight of August, causing heavy floods in the Jhelum, Chenab and Indus rivers, which resulted in a serious epidemic of malaria The year 1929 although it did not exhibit the remarkable salubrity of the previous year must be regarded, in spite of certain vicissitudes of climate, which occasioned an epidemic of malaria in one region and economic stress in another, as a relatively healthy year The birth-rate was 44 45 which was the highest of all other provinces in India, and the death-rate 28 75 which exceeded the provincial rates except those of Bombay and Central Provinces Apart from the somewhat severe epidemic of malaria following the heavy floods in certain districts the year was on the whole a very healthy one The cholera figures were somewhat higher than those of the previous year and while no serious outbreak occurred the disease was widely diffused and practically all the districts in the Province were affected

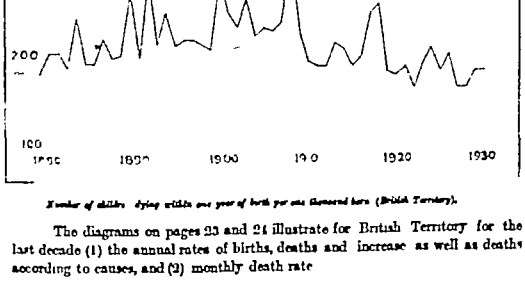

1930. In 1930 the climate was favourable for health the monsoon being heavy but sufficiently early not to encourage the spread of malaria and plague. The death rate under the various heads of mortality during the year 1930 is compared with the average of the previous five years in the table below

Year	Cholera	Small-pox.	Plague.	Fevers.	Dysentery and Diarrhœa.	Respiratory diseases.	Injuries.	All other causes.	Total.
1	2	3	4	5	6	7	8	9	10
1930.	0·06	0·04	0·03	20·58	0·50	·25	0·20	8·23	29·08
1925—29.	0·18	0·80	1·61	18·67	0·84	·46	0·23	8·05	29·18
Increase or decrease in 1930.	—0·12	—0·24	—1·58	+1·91	+0·06	—0·11	—0·03	+0·27	+0·18

The diminished death rates from cholera, small-pox and plague is evidence of the practical absence in epidemic form of those diseases from the Province during the year

Summary 1921—30. To sum up the decade 1921—30 may be described as on the whole a healthy one with the exception of great epidemics of plague in 1924 and 1926 and a severe outbreak of cholera in Lahore and Ferozepore Districts in 1926 and in Kulu Valley in 1928. Malaria also prevailed in an epidemic form during the autumn of several years, more particularly in the year 1929

The constantly high birth-rate of the Punjab which is usually about twice that of the United Kingdom, in spite of its high death rate (chiefly as a result of the frequency and severity of epidemic visitations) is nevertheless an encouraging sign since it indicates that the somewhat severe epidemics to which the Province is liable, exercise little or no permanent effect on the virility and recuperative power of its inhabitants. Both in respect of its birth-rate and death rate the Punjab compared favourably with other provinces of India and renewed its depleted population at a relatively high rate. The infantile mortality was particularly low during the last decade as shown in the diagram below

Number of children dying within one year of birth per one thousand born (British Territory).

The diagrams on pages 23 and 24 illustrate for British Territory for the last decade (1) the annual rates of births, deaths and increase as well as deaths according to causes, and (2) monthly death rate

18 The general healthiness of the last decade is no doubt due to a considerable extent to the inauguration of various schemes for the expansion of medical relief in the Province In order to attain the ideal of one dispensary for every 100 square miles of territory or for every 30,000 of population the calculations showed that it would be necessary to open 375 new dispensaries in rural areas In 1925 a standard plan for a small and compact dispensary was laid down, and the Government agreed to give a grant of Rs 5,400/- for the construction and Rs 1,600/- for the equipment of each such dispensary The programme has been acted upon almost completely during the decade, the number of dispensaries actually opened from 1925 to the end of 1930 being 359 Hospitals and Dispensaries.

The need of efficient arrangements for female medical aid and education has to some extent been provided for A good number of new female hospitals and dispensaries was established The Lady Aitchison Hospital, Lahore, and the Lady Reading Hospital for Women and Children at Simla, have gained much popularity during the decade The Punjab Medical School for Women, with which is incorporated the Women's Christian College, Ludhiana, is at present the only institution from which women can qualify for appointment as Sub-Assistant Surgeons During the decade 15 new hospitals for women were opened in various districts, including the Government Hospital for Women and Children at Lahore. Separate sections for females have been opened in 12 existing civil hospitals A notable addition to general hospitals is the opening of the Dental Hospital at Lahore

A solid progress continued to be made during the decade both in respect of the number of hospitals and the extent of relief given The number of patients treated has been on the increase as shown in the table in the margin The rise in the number of out-door patients is due chiefly to the increase in the number of rural dispensaries, and the increase in the number of in-door patients is partly due to the good work done in the hospitals of the Province

Year	Number of hospitals and dispensaries on the last day of the year	In-door patients	Out-door patients	Total
1	2	3	4	5
1921	583	93 005	4,921,076	5,014 081
1922	610	97,808	5,051,268	5,149,076
1923	626	104,999	5,576,776	5 681,775
1924	640	109,506	5,825,573	5 935 079
1925	666	117,592	5,866,648	5 984,240
1926	780	122 818	7,022 633	7,146,451
1927	885	135 978	7,825,645	7,961 623
1928	964	153,797	8 822,962	8,976,759
1929	1,026	173,302	10,617,136	10 790 440
1930	1 036	181,482	11,561,187	11 742 669

19 Some terms that will occur hereafter in this Report may be conveniently defined at this stage Definitions

"Cultivable Area" —includes land actually under cultivation, fallows and waste available for cultivation, such waste does not include areas in which cultivation is forbidden by law or custom, such as reserved forests or common lands set apart for a specific purpose It does, however, include common lands which can be made available for cultivation by partition even though such partition has not been effected

"Gross Cultivated Area" —means the area actually sown in any one year with no deduction for failure of crops, any land sown at both seasons of the year (*i e*, double cropped) being counted twice

"Net Cultivated Area" —means the area sown in any one year, the double cropped area not being counted twice In other words net cultivated area refers to area of land sown, whilst gross cultivated area refers to the crops sown, to avoid confusion gross cultivated area is referred to generally as the sown area

Neither of these areas include land which lies fallow for the whole year though such land may be regularly though infrequently cultivated.

Agricultural Conditions.

20 Agriculture being the premier industry of the Province a summary of the agricultural conditions for the British Territory is given below year by year The decade begins with *kharif* 1921

Seasons and Crops 1921-22.

Owing to the shortage of winter rains conditions were not favourable for the sowing of sugarcane and cotton. The monsoon which burst in the second week of July gave general and sufficient rain nearly all over the Province. It remained very active till the middle of August. Ample moisture was thus available for the sowing of *kharif* crops. Conditions were also very favourable for the maturing of these crops as well as the spring sowings. Well distributed rain in winter though below normal did a lot of good to the standing spring crops and a clear and sunny April was beneficent to the maturing of grain and its threshing. The season was on the whole above the average, being a great improvement on the previous year

1922-23.

The rain in the earlier part of 1922 was sufficient for cotton and sugarcane sowings. The monsoon broke about a month earlier than usual and was a good one. In July the rain was below normal, but good rain fell in August and first half of September throughout the Province, ending about the last week of September The rainfall was above normal in the south-east and the sub-montane districts, about average in the central Punjab and below normal in the west. The September rain followed by light showers in October resulted in good *rabi* sowings. The winter rain after Christmas, heavier than usual, continued till the middle of March and was particularly useful for unirrigated crops. The dry weather in April was favourable for harvesting though heavy unceasing rain in May did some damage to straw and grain on the threshing floor The year was considerably above the average

1923-24

The conditions for cotton and cane sowings were favourable on account of the rain in the previous winter and early part of 1923 The monsoon appeared after the first week of July and was unusually active in August Heavy and widespread rain fell throughout the Province and helped the *kharif* acreage to expand although cotton in low lying areas was slightly damaged. The monsoon, however ceased early and conditions were not particularly favourable for the maturing of *kharif* crops or the *rabi* sowings The winter rain was good in the east and from light to moderate elsewhere April was dry and favourable for harvesting operations which were, however hampered in some districts by the outbreak of plague The year was on the whole above average

1924-25.

There were adequate rains for cotton and cane sowings The monsoon arrived in the second week of July and gave moderate rain during July and August nearly all over the Province. It was very active during the first week of September but at the end of the second week a break set in which lasted up to the 27th of the month Heavy rains which fell about the end of September caused floods which damaged the standing crops, especially along the banks of the Jumna. The conditions for *rabi* sowings were very favourable The rain in December was above normal though February and March were dry and retarded the growth of standing crops in unirrigated areas. The harvest was therefore not as large as was expected from the extensive sowings. The area under cotton was the largest on record and the price of cotton was high, though less than in the previous year

1925-26 The year was about average Light rain, which fell nearly all over the Province during the second half of January and in some districts during the second week of February, was useful for cotton and cane-sowings The monsoon broke in the third week of June, earlier than usual and was plentiful throughout the Province The conditions for early *kharif* sowings were thus favourable July and August had plentiful rain except in the west, hindering further sowings and causing floods in low-lying lands The period from the end of August to the beginning of November was dry, and conditions were thus unfavourable for the maturing of *kharif* crops This was also an adverse factor for the *rabi* sowings There was only little rain till next March and unirrigated crops suffered considerably Some rain fell at last in March and proved beneficial to the standing crops April was dry and favourable for harvesting though rain in May did some damage on the threshing floor The area under cotton was even larger than during the previous year

1926-27 The rain in March was suitable for cotton and cane sowings, but heavy rain in second half of May caused a hard crust to form on the surface preventing proper germination Cotton had, therefore, to be resown in many places The monsoon appeared in the second week of July, later than usual, but gave fairly good rain throughout the Province except in the west Rains during August were generally heavy and those during September quite sufficient Conditions were thus favourable for *kharif* sowings though less satisfactory for the maturing Hot winds in October as well as the boll-worm damaged the cotton October, November and December being dry except for light rains in some districts, conditions were not very favourable for spring sowings Light rain fell during February all over the Province and during March in most districts, which was very beneficial to standing crops April and May were dry and favourable for harvesting The season was on the whole above the average

1927-28. The climatic conditions were not generally favourable for cotton sowings on account of absence of winter rains, there being only light showers in March, April and May The rainfall during July was sufficient all over the Province except in the west In August the montane and sub-montane districts received plentiful rain though it was below normal in other places September was generally dry, but rain fell in October which made up the deficiency Conditions were not, however, on the whole very favourable for the maturing of *kharif* crops Hail-storms and locust as well as the boll-worm also did damage The conditions for *rabi* sowings were not favourable except in the sub-montane districts, as October and November were generally dry Rain, however, fell in the latter half of December as well as January, which was above normal in the eastern districts, but below normal elsewhere The cloudy weather of January and February created rust which did considerable damage to the wheat crop Strong dry winds and dust-storms set in early in March, and great damage was done in the central and west-central parts of the Province, its extent being only discovered at the time of harvesting The year was on the whole an average one

1928-29 The conditions for the sowing of sugarcane and cotton were adverse as rainfall had been in defect from January to May except in Ambala and Jullundur Divisions The monsoon arrived late and was less active than usual and the rainfall was poor till the second half of August except in the montane and sub-montane tracts The summer was extremely hot, being the hottest for several decades Prospects brightened when plentiful rain fell in the second half of August and the beginning of September, which was well distributed except in the south-west

Heavy floods occurred in rivers Jhelum, Chenab and Ravi and to a lesser extent in the Sutlej causing much destruction of life and property including crops, stocks of food and cattle in the riverain tracts. The greater part of September and November was, however very dry. The presence of moisture due to September rains and fresh rainfall in November and December led to extensive *rabi* sowings which benefitted by moderate rainfall in January. A cold wave of great severity however passed over most districts in the beginning of February and gave a rude shock to the expectations of a plentiful harvest. Great damage was done to fruit-bearing trees in the south west. In March strong dry winds also caused further damage unirrigated areas *suffering most*. The season was thus considerably below the average.

1929-30. The absence of spring rains and unfavourable conditions during February and March were adverse factors for the sowing of cotton and sugarcane. In June the rain was above normal and there were good rains in July and August and conditions were favourable for the sowing of the rest of the autumn crops. Heavy floods, as a result of excessive rain in the Indus, Chenab and Jhelum rivers caused considerable damage to standing crops. September and October were generally dry. The supplies of canal water were generally short and late. Conditions were thus not satisfactory for the maturing of *kharif* crops. Cotton was damaged by *tela* and white fly in some places. On account of a dry October and November conditions were not generally favourable for *rabi* sowings. The winter rain was also in defect the western districts receiving no rain at all. Some rainfall in certain districts during March was very beneficial. Locusts and hail-storms also damaged the crops in several districts. Rain particularly accompanied by hail also caused some damage to harvested crops. The season was thus on the whole considerably below the average.

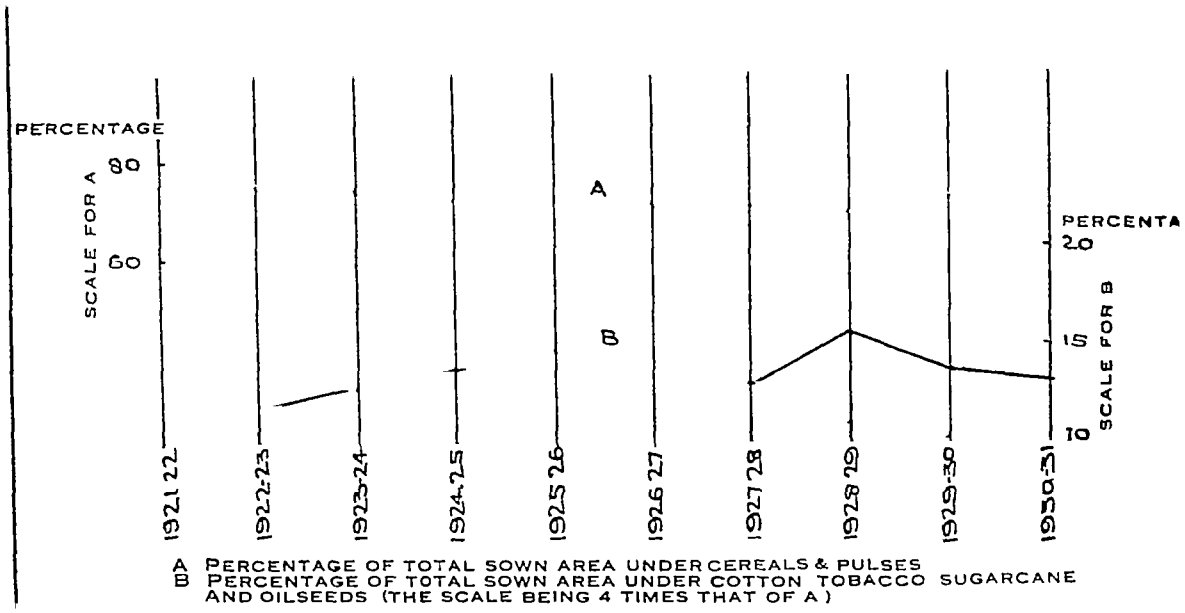

1930-31. Conditions were not favourable for the sowing of cotton, but the cultivation of cane was greater than during the year before in irrigated areas. The restricted area under cotton was due to the scarcity of rain the fall in the price and the appearance of locust at the sowing time. In June the rainfall was above average in south-eastern and sub-montane tracts but generally below normal elsewhere. The monsoon remained fairly active during July and gave moderate to heavy rainfall throughout the Province. The canal water was sufficient. The conditions were generally unfavourable for *kharif* sowings but rainfall during August and September though only normal, was useful to the standing crops. October November and December remaining practically dry except for light rain at places the conditions for *rabi* sowings were not favourable. Water in canal was also short in some districts a river supply was low. Rain in January February and March was beneficial to the standing crops. The year was below average but was considerably better than the previous two the matured area being slightly less than the average for the last ten years.

Principal Figures. The table below shows for British Territory the yearly sown and matured areas the percentage of maturity and the annual rainfall

Year	Rain area (in acres)	Matured area (in acres)	Percentage of maturity	Rainfall (in inches)	Year	Rain area (in acres)	Matured area (in acres)	Percentage of maturity	Rainfall (in inches)
1	2	3	4	5	1	2	3	4	5
1911-12	21,[illegible],706	3,[illegible],841	[illegible]	[illegible]	1926-27	20,[illegible],[illegible]	21,17[illegible],3	[illegible]	[illegible]
1912-13	21,[illegible],[illegible]	[illegible],[illegible]	[illegible]	31	1927	[illegible],[illegible]	[illegible]	[illegible]	[illegible]
1913	[illegible],[illegible],[illegible]	24,[illegible],[illegible]	24	19	[illegible]	[illegible],[illegible]	[illegible]	[illegible]	[illegible]
1914	21,7	[illegible],[illegible],[illegible]	[illegible]	19	[illegible]	[illegible],[illegible]	[illegible],[illegible]	[illegible]	[illegible]
1915-16	[illegible],[illegible],[illegible]	[illegible],[illegible],[illegible]	83	30	1930-31	[illegible],[illegible]	[illegible],[illegible]	83	[illegible]
1916-17	[illegible],[illegible],[illegible]	[illegible],[illegible],[illegible]	[illegible]	[illegible]					

The sown area fluctuates considerably from year to year mainly with the character of rainfall, being low in a dry year and high in a year of good monsoon The percentage of matured area is adversely affected both by the failure of monsoon and excess of rainfall According to the Punjab peasant ideal monsoon conditions are represented by *Sawan nit* (a daily shower during the month of *Sawan*, *i e* , middle of July to middle of August), *Bhadon char* (a good shower every week during *Bhadon*, *i e* , middle of August to middle of September), and *Assu ik*, (one good shower in *Asoj*, *i e* , middle of September to middle of October) The total area under the plough has increased by 1,309,815 acres or by 4 5 per cent during the last decade The limit of cultivation is being reached as not many areas are now available for being brought under cultivation,* and in the near future an effort will have to be made to meet the growing demand of the population by means of intensive cultivation, aided in particular by improved seeds and implements

A diagram showing the annual percentage of total sown area under cereals and pulses and under valuable crops, namely cotton, sugarcane, tobacco and oil-seeds, is given below The agricultural statistics are given in Subsidiary Table I for British Territory and Punjab States The figures for the latter being incomplete, do not admit of detailed discussion

A PERCENTAGE OF TOTAL SOWN AREA UNDER CEREALS & PULSES
B PERCENTAGE OF TOTAL SOWN AREA UNDER COTTON TOBACCO SUGARCANE AND OILSEEDS (THE SCALE BEING 4 TIMES THAT OF A)

It is evident that food crops occupy 69 to 74 per cent of the sown area each year The area under valuable crops fluctuates with the character of the season and prices Fodder crops take up the bulk of the remaining area In the Punjab the cattle are almost as numerous as human beings, and like them are fed on the produce of the soil The economic condition of agriculturists having deteriorated within the last few years the decrease in the number of cattle is perceptible, although bullocks and milch cattle are carefully looked after by their owners even in times of scarcity The figures for two recent cattle censuses, quoted in the margin, are illustrative Bullocks fit for plough have decreased by 3 per cent and other bullocks by 19 per cent The decrease among male buffaloes fit for plough is 5 per cent and among others 18 per cent Milch cows have decreased by 10 per cent

Year	Total	Agricultural Stock	Milch Cattle	Others
1928	24 794 810	4,480 323	5,461 113	14,853,374
1930	23 696,189	4 327,339	5 145,708	14,223,142

*To have an idea about the area of land available for cultivation in the various provinces reference may be made to the Special Committee's Report on the Trade Agreement made at Ottawa between the Government of India and His Majesty's Government in the United Kingdom, published in the Punjab Government Gazette part II, dated the 16th December 1932, page 715

and other cows by 12 per cent The number of she-buffaloes has declined by 2 per cent. while other she-buffaloes show an increase of 4 per cent. The increase in the number of she-buffaloes is due to their increasing popularity both because a she-buffalo is more profitable to keep than a cow as it produces more milk and *ghi* and also because in the absence of extensive pastures it is more convenient to keep as unlike the cow it can be fed at the stall.

An estimate of the yield and value of the crops in the Province is a laborious process, but an index of the prosperity of agricultural classes is furnished in a sense by the price of agricultural land.* The statement in the margin shows the price per cultivated acre of land between 1918-19 and 1930-31 It is noteworthy that the price of land per cultivated acre at the end of the last decade had more than doubled since 1918-19

Year	Price per acre cultivated area.	Year	Price per acre cultivated area.
1918-19	164	1925-26	277
1919-20	173	1926-27	283
1920-21	218	1927-28	402
1921-22	262	1928-29	377
1922-23	311	1929-30	406
1923-24	253	1930-31	420
1924-25	428		

Agriculture

21 The future prosperity of the Province being closely allied with agricultural advance it will not be out of place to sketch briefly the activities of the Agricultural Department

The Department was organised in 1906 With the inauguration of the Reforms Scheme in 1921 it became a "transferred" subject under the charge of a Minister Its general administration is in the hands of the Director of Agriculture who has his headquarters at Lahore.

The present functions of the Department may be divided into three main heads —

1 Education. 2 Research 3 Demonstration and Propaganda.

Education.

The Punjab Agricultural College, Lyallpur which has been the chief centre of agricultural education in the Province, was opened in 1909 and now gives courses for the B.Sc. (Agri.) and M.Sc. (Agri.) degrees and also a number of non-university courses to meet various needs of the community It is equipped with Chemical, Botanical, Entomological and other Laboratories, Library Herbarium, Museum, etc The students are boarded on the estate. The College began its career with a three years diploma course in English, which was subsequently extended to four years. These courses included a training in practical agriculture with theoretical and practical instruction in such sciences as are of direct assistance to farmers, i.e. Botany Entomology Chemistry Physics, Veterinary Science, etc. The standard of education for entrance to the course was the University Matriculation Examination or its equivalent. Students

* Mr Calvert in Chapter VIII of his book Wealth and Welfare has very ably dealt with the factors that contribute to the rise of the price of agricultural land in this Province. These are summarised below

(i) The assured margin of profit for the cultivator owing to the fixation of the revenue demand under the British, which in all fairness starting competition among agriculturists both landlords and tenants, attracts the middlemen with capital

(ii) The increased profit obtainable from land owing to increased facilities of transport and other beneficent work of the State like canals;

(iii) A real improvement brought about by the employment of capital on works such as well-sinking land-making etc

(iv) The fragmentation of holdings enable small plot to be purchased by men of moderate means;

(v) The land has come to possess security value as only rare absence of the purchase of land occur in most places

(vi) The dearth of any other secure investments, especially among many well-to-do Muslims, to reform bank interest as matter of religious belief; and

(vii) The population to land on account of the certainty that the price would rise further

It is to be noted that the sale-price generally contains fictitious items provided to defeat pre-emption claims, and that the cash-price represents something more than he is actually paid.

who went successfully through the course were eligible for posts of Agricultural Assistants and Demonstrators in the Department or for employment on private farms In 1912 a dairy with 20 cows was started to enable the Professor of Agriculture to teach the students practical dairying as a part of the diploma course In 1917, the College was affiliated to the Punjab University and the four years' diploma course was remodelled to form the present four years' course for the B Sc Degree in Agriculture

In 1918 a vernacular course of one year's duration was started for certificated teachers of the Education Department to enable them to teach elementary agriculture and rural science in rural vernacular middle schools In 1924 a course covering 1½ months was started for " *Lohars* " (village blacksmiths)

A Rural Economy Course lasting one month is also given annually and is attended by officers deputed to it by various departments of Government, *e g*, Assistant Commissioners, Forest Officers, Assistant Engineers, Extra Assistant Commissioners, Zilladars and Inspectors of Co-operative Societies

Research.

The Department has experimental farms at Lyallpur, Gurdaspur, Hansi, Sirsa, Multan, Montgomery, Rawalpindi and Jullundur On these farms, work in connection with the testing of the relative merits of different types of crops, seed selection, the evolution and testing of new implements, research in connection with rotations, manures and cultivation, is in progress Investigations are also carried out on the control of pests and diseases of various crops Miscellaneous investigations such as silage-making, the evolution of improved *gur* furnaces, meteorological records, farm castings, etc , are other features of the work As a result of the work done in the botanical section and on these farms very marked success has attended the evolution and introduction in the Province on a large scale of 4F American cotton and other improved varieties of *desi* cottons, wheat types 11 and 8A, and Coimbatore sugarcanes All these improved varieties of crops bring higher yields and additional income to the growers

The Department also has in various parts of the Province a number of seed farms on which the improved seeds evolved in the Botanical Section and on experimental farms are multiplied up for subsequent distribution and sale to the cultivators In addition, there is in the majority of districts a small district farm where the local applicability of the results of research work done at the main experimental stations can be tested, and where suitable demonstrations of the methods of cultivation and the growing of particular varieties of crops can be given

In the Chemical Section a large amount of analytical work on soils, manures, fodders, etc , is done annually, and systematic investigations are carried out to determine the extent to which soils are being depleted of the various materials of plant food

In the Entomological Section the life histories of a large number of pests of important crops have been studied and in each case suitable methods of control have been determined

In the Engineering Section valuable work has been done on the evolution of improved strainers for tube wells, and a number of tube wells with these strainers has been sunk An important activity of this section is the work done on the augmentation of the supply of water in ordinary percolation wells The well boring section annually bores about 1,000 wells for cultivators all over the Province

Demonstration and Propaganda.

The policy of the Agricultural Department so far has been to explain and demonstrate to farmers the results of investigations carried out on its experimental farms and elsewhere The work is carried out by means of

(1) Demonstration plots which are laid on *zamindari* lands demonstrating the advantages of improved varieties of the various crops, methods of cultivation, use of manures, protection against pests and diseases, etc

(2) On occasions where large numbers of farmers meet such as cattle fairs, etc. demonstrations of improved implements are given, and improved seeds and other produce are exhibited. These demonstrations are accompanied by short lectures illustrated by magic lantern views. Ploughing matches are held on these occasions where the District Boards concerned offer prizes. In such competitions ploughs and other improved implements are often given as prizes by firms who sell agricultural implements.

(3) Improved implements are lent out to farmers who wish to try them for themselves and in many cases the cultivators buy them at the end of the trials.

(4) Popular lectures are given by staff when touring in villages.

The Department also gives important assistance to cultivators in several other directions Amongst these the layout of fruit orchards, the supply of good varieties of fruit trees the development of cottage industries where climatic conditions are favourable the production of silk by the rearing of silk worms, the cultivation of lac and the keeping of poultry may be mentioned as examples.

Improvement in Methods of Agriculture.

22 One of the most difficult problems is to revolutionize the existing system of growing crops. Cultivators are very conservative in adopting any new line until they are satisfied that it is a distinct improvement upon their own practice Once they are convinced of its advantages, however they will readily take to it. Notable examples are the rapid spread of American cotton and improved wheats in the Province during the last two decades and the introduction of improved Coimbatore canes during the last few years. The figures below give an idea of the extent to which improved varieties of cotton and wheat have been introduced of the two varieties of wheat Punjal 11 and 8A, the former is no longer popular while the latter now occupies an area exceeding two million acres

Year	Acreage under Punjab 11	Wheat Types 8A.	Cotton acreage (see) in the Punjab for both American and Desi.
1912-13			1,152,979
1913-14			1,326,149
1914-15			1,457,762
1915-1	27,900		1,478,914
1916-17	87,900		1,941,8 1
1917-1	196,9		1,811,555
1918-19	302,500	1	1,112,955
1919-20	377,800	600	2,020,527
1920-21	434,100	2,900	2,057 16

Year	† Acreage (17) American	Desi.
1921-22	719,900	22,900	661,251	747,001
1922-23	750,700	85,000	2 ,431	877,200
1923-24	816 16	171,200	905,519	1 1 5 15
1 1 25	893,8	237,900	944,332	1,062 ,7
1925-26	850,451	831,4 1	1,117 779	1,134 607
1926-27	930,193	917,475	1,151,153	1,249 655
1927-28	867,251	1,274,110	750 339	1 91 129
1928-29	931,700	1,521,900	971,2	1,53 ,841
1929-30	1,31 ,050	1, 57 ,9	856 ,7	1 ,07 ,43
1930-31	73 ,600	2,29 ,.	434 ,50	1,3 ,431

(1) as introduced during 1911-12 season, and according to (2) in rotation with one acre of 8 acres as seed.

† Prior to 1 21-22 all cottons were returned under one head Desi and therefore the growth of the American varieties from 1914-15 to 1920-21 is not traceable

23 The planting of fruit gardens has been on the increase during the last few years It is difficult to obtain accurate information as to the area under fruit gardens An attempt was made by the Agricultural Department to ascertain the area in 1928, and as a result it was considered that such area amounted to about 40,000 acres In colony areas it is not easy to increase the area under fruit substantially at present, as the additional water supply which fruit trees require is not readily available

Fruit Orchards

24 It was remarked in the last Census Report (page 21) that the absence of any manufacture of agricultural implements was most noticeable The last decade, however, has witnessed a very marked advance, particularly so in the manufacture of fodder-cutters, sugarcane-crushing mills iron persian wheels, ploughs and to a lesser extent other implements Whilst the manufacture of these implements is done at a large number of centres all over the Province, Batala, in the Gurdaspur District, appears to be most prominent in this respect An inquiry made in 1930 by the Director of Agriculture showed that it possessed no less than 21 iron foundries with a total annual output of over 10,000 implements of all sorts, valued at Rs 537,000/-

Use of Improved Implements

Meston ploughs	6 658
Cane crushing	4 996
Chaff-cutters	12 211
Persian wheels	430
Bar harrows	178

According to the information collected by the Agricultural Department for the year ended 30th June 1931, the number of improved implements of Indian manufacture shown in the margin was sold in the Punjab It is believed that most of these were manufactured within the Province In addition to these some 4,700 agricultural implements of all sorts but of foreign manufacture were also sold in the Province during the year It may be remarked here that in most of the districts the iron persian wheel has replaced the old persian wheel

Until the general agricultural depression set in, the use of artificial fertilisers was steadily increasing in the Punjab The fall in prices of all farm produce has, however given a set-back to their use, as very few crops continue to give an economic return from the application of artificial manures at present even though a reduction has been made in the cost of fertilisers

25 The Veterinary Department plays an important part in the lives of Agriculturists It was established as far back as 1891 when the Government of India laid down that though in the first instance its primary duty was to deal with cattle disease, in the future horse-breeding duties would be paramount The department was provincialized in 1901 and placed under the charge of the Director of Agriculture In 1903, the Government of India transferred the entire control of horse, mule and donkey breeding in 15 selected districts of the Punjab to the Army Remount Department Later on, the Army Remount Department ceased to function in certain selected districts, such as Lahore, Amritsar, Ferozepore, Gujranwala and Dera Ghazi Khan In the first three districts, the horse, mule and donkey breeding work is controlled by a society known as "Lahore-Amritsar-Ferozepore Horse, Pony and Mule Breeding Society" The other two districts have been declared as non-selected districts and transferred to the charge of the Civil Veterinary Department

Agricultural Stock and its Care

The Director of Agriculture remained head of the Veterinary Department up to the end of the year 1927-28 when, on the recommendation of the Royal Commission on Agriculture, it was separated from the Department of Agriculture

General Development of Civil Veterinary Department

and placed under the charge of the Director of Veterinary Services. As head of the Department he exercises a general control and supervision over the work of the Principal, Punjab Veterinary College the Live Stock Officer the Superintendent Government Cattle Farm, Hissar and other Superintendents and Deputy Superintendents working in the various districts of the Province.

Cattle Farms. In 1900 a scheme was formulated for a Dhanni Cattle Breeding Farm near Sargodha at *rakhs* Dharewa and Rusala, but the matter was dropped in 1910 as the lands required for the purpose could not be transferred from the Military Department.

In 1912 the Hissar Cattle Farm of over 39 000 acres, which was hitherto under the control of the Government of India was handed over to the Punjab Government and placed in charge of officers of the Civil Veterinary Department. Since then the number of Hissar bulls supplied by the Government Cattle Farm, Hissar to the Punjab districts amounts to 4 702 bulls. The total number of stud bulls at work throughout the Province on 31st March 1931 was 3,517 Of these, about 90 per cent. were supplied at concession rates from the Government Cattle Farm, Hissar

The Punjab Government is giving liberal grants annually for the improvement of the Dhanni and Hariana breeds of cattle in the famous Dhanni and Hariana cattle tracts to —

the District Boards of Attock, Rawalpindi, Jhelum, Shahpur and Mianwali in the Dhanni tract for the improvement of the Dhanni breed of cattle, and

the District Boards of Hissar Rohtak and Gurgaon in the Hariana tract for the improvement of the Hariana breed.

In accordance with the policy of the Department to concentrate attention on certain areas best suited for cattle and buffalo breeding the above system of grants was introduced for the Dhanni cattle tract in 1919-20 and for the Hariana cattle tract in 1924 25 In addition to the Government Cattle Farm at Hissar situated in the centre of the Hariana tract, schemes for the opening of Government farms in the Dhanni tract as well as in the Nili Bar Canal Colony are under contemplation It is feared that owing to financial stringency the carrying out of these projects will be held in abeyance for some time.

Five grantee cattle farms of a total area of about 15,300 acres have been opened in the Lower Bari Doab Canal Colony Out of these, two are maintaining herds of pure bred Montgomery cattle and the remaining three for Hissar cattle. In addition, a grantee dairy farm comprising an area of 485 acres has been started near the town of Montgomery Besides there are in the neighbourhood of Shergarh (in Montgomery District) at a distance of about 12 miles from Renala Khurd Railway Station, Shergarh Small holders Grants comprising 218½ rectangles of land in seven different *chaks* or villages. The lands have been allotted in small parcels of half a rectangle and one rectangle amongst 223 grantees whose conditions require them to maintain one cow of the Montgomery breed to the satisfaction of the Civil Veterinary Department for each half rectangle of 12½ acres.

Horse, Mule and Cattle Breeding. 26. The Punjab always stands in need of efficient cattle to meet the demand for milk and *ghi* as well as bullocks for the plough The Province has a well earned reputation for producing good *live stock including buffaloes of high* milking capacity and in certain areas the local agriculturists are depend nt almost entirely on the breeding of stock and the sale of milk for their livelihood

The areas, however in which stock breeding can be carried on with profit were up to the present period of depression gradually dwindling as th result of

the increase in irrigation facilities and consequent rise in the value of land and farm produce

The Live Stock Officer and other District Veterinary Officers of the Civil Veterinary Department provide the advising and inspecting agency for the entire veterinary activities in the Province, including live-stock improvement work and the control of diseases under the direct supervision of the Director of Veterinary Services

Hitherto, the only agency for the supply of suitable bulls for breeding purposes was the Government Cattle Farm, Hissar, but the establishment of the grantee farms in the Lower Bari Doab Canal Colony and the introduction of the Dhanni and Hariana schemes in the districts forming the home of these breeds has made it possible to arrange for the supply of pedigree bulls of such breeds as are popular in the various districts of the Province

In addition to the supply of bulls, the Government Cattle Farm, Hissar, meets the requirements for horse and donkey stallions in the non-selected districts of the Province Facilities are being developed for the supply of pedigree buffalo-bulls, sheep and goats to interested breeders In many districts the income derived from horse and cattle fairs by the District Boards is quite a substantial amount and the tendency is towards exploring this method of raising revenue

Horse and cattle fairs and the 'one day village cattle shows' provide the opportunity for the carrying out of live-stock improvement propaganda by the Department They are being taken full advantage of for the demonstration of the better types of stock as well as improved agricultural implements and farm produce They tend to relieve the prevailing dullness of rural life by providing an occasional district fete

Prevention and Treatment of Cattle Diseases.

27 There are now 287 Veterinary Hospitals in the Province each in charge of a Veterinary Assistant Surgeon or Veterinary Assistant, whose duties are mainly centred on the prevention of disease within his area by the inoculation of cattle and other live-stock with protective sera and vaccines The number of animals treated by the staff is yearly increasing A very gratifying indication of the way the Department is gaining the confidence of the public is shown by the number of offers received from private individuals towards the cost of establishing veterinary hospitals in different areas

Punjab Veterinary College, Lahore

This institution was established in 1882 for the instruction of Indians, civil and military, in veterinary medicine and surgery The college is thoroughly equipped and has exceptional facilities for teaching purposes It has proved a great success The course of study of the college was previously for three years in Urdu and a 4 years' course in English was started in 1921 In this institution stipends are given both by Government and local bodies to students to enable them to qualify themselves for the veterinary profession

Irrigation.

28 The agricultural prosperity of the Province is to a very large extent dependent on irrigation The canals are a most valuable asset and protect the Province against famine even in a dry year

The main sources of irrigation are indicated in the margin, as also the extent of irrigation from each source Canals of all kinds irrigate 728 out of every 1,000 irrigated acres as against 648 at last census The majority of these canals are owned and worked by Government Next in importance come wells with total irrigation amounting to 262 out of

Government canals	695
Private canals	33
Wells	262
Other sources	10
	1,000

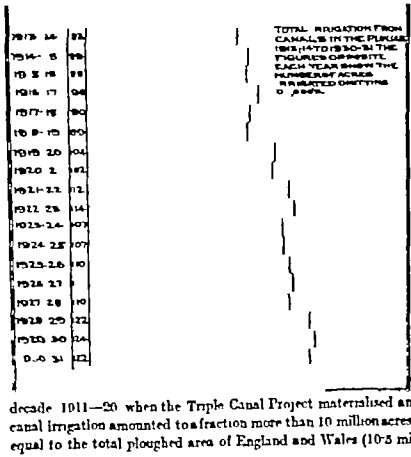

every 1 000 acres as against 299 at last census. The decline is due to the increased irrigation from canals. The wells are generally private property owned by the land owners or by groups of land-owners. During the past decade masonary wells in use have increased from 265,879 in 1920 to 292 102 in 1930 It, however does not follow that the well irrigation has increased in the same proportion, as irrigation from wells is extended in a dry year and contracts considerably when monsoon conditions are normal. The irrigation from other sources is mostly by lift from ponds, rivers and streams. The table below shows for each district the percentage of the average area irrigated from the different sources during the last decade the districts have been arranged according to the extent of canal irrigation.

District.	Percentage of canal irrigation.	Percentage of well irrigation.	Percentage of other sources of irrigation.	District.	Percentage of canal irrigation.	Percentage of well irrigation.	Percentage of other sources of irrigation.	District.	Percentage of canal irrigation.	Percentage of tanks, jhils and other sources of irrigation.	Percentage of well irrigation.
Lyallpur	98	1		Gujrat	77	23		Ludhiana	54	24	
Hissar	90	1		Muzaffargarh	68	29	3	Rawalpindi	23	48	29
Multan	90	8	2	Karnal	66	33	1	Attock	13	83	5
Shahpur	88	12		Jhang	66	34		Ambala	4	64	32
Montgomery	84	16		Amritsar	56	44		Rohtak	2	91	7
Sheikhupura	81	18	1	Gujranwala	53	46	1	Simla			100
Ferozepore	83	18		Gurdaspur	42	57	1	Kangra			100
Lahore	80	20		Gurgaon	38	58	4	Jullundur		100	
Dera Ghazi Khan.	79	15	6	Hoshiarpur	34	61	3	Jhelum		92	8
Rohtak	77	23		Mianwali	33	66	1	*British Territory*	73	20	7

It will be seen that in 10 districts more than half of the irrigated area is served by canals and in the other 13 barring Kangra and Simla the same amount is irrigated by wells. In Kangra and Simla the only source of irrigation is streams and springs.

Canal Irrigation.

The canal irrigated area has been steadily rising during the last decade

The statistics are available from the year 1887 88 when all the canals then in existence irrigated only 2·3 million acres. With the opening of the Lower Chenab Canal the canal irrigated area rose to 6 million acres in 1900-01 A further development took place mainly during the decade 1911—20 when the Triple Canal Project materialised and in 1920-21 the canal irrigation amounted to a fraction more than 10 million acres, which is nearly equal to the total ploughed area of England and Wales (10·5 million acres). The

feature of development during the last decade is the opening of the Sutlej Valley Project, a description of which appears in the next paragraph As a result the canal-irrigated area rose to the unprecedented figure of 12 4 million acres in 1929-30 The diagram given on page 38 shows the extent of canal irrigation in the Punjab for each year of the period, 1913-14 to 1930-31 Separate figures for the Punjab prior to 1913-14 are not available as the Delhi Province was then a part of it For this reason the rectangles for the period, 1887-88 to 1912-13, do not appear in the marginal diagram, and can be seen at page 13 of the 1921 Report

The following statement gives the various particulars about the principal canal systems —

Serial No	Name of canal system	Length of main line in miles	Length of Distributaries in miles	Culturable area commanded in thousands acres	Average area irrigated annually in thousands of acres	Date of commencement of construction	Date of first irrigation	Date of completion of construction
1	2	3	4	5	6	7	8	9
1	Western Jumna	335	1,892	2,305	877	Before annexation 1888-Sirsa Branch	1820 1891 92	1886 1895
2	Sirhind	537	3,446	2,093	1 774	1867 68	1883 84	1886 87
3	Upper Bari Doab	341	1,535	1,452	1,304	1849 50	1860 61	1878 79

17	Pakpattan Canal	200	975	1 103	276	1923 24	1926 27	31-3 1932.
18	Dipalpur Canal	157	866	888	391	1924 25	1927 28	31 3 1932
19	Eastern Canal	79	377	423	137	1924 25	1927 28	31 3 1932
20	Mailsi Canal	107	643	739	239	1925 26	1927 28	31 3 1932

(a) As an inundation canal system

NOTE.—The average area shown in column 6 is for the ten years, 1921 22 to 1930 31 inclusive, but in the case of the Upper and the Lower Sutlej inundation canals the average area is for the years 1921 22 to 1927 28 These two systems were, thereafter, amalgamated with Dipalpur and Mailsi canals, respectively, of the Sutlej Valley Project. The Sutlej Valley Project canals have not been in existence for the whole decade, the average area in their case, therefore, is for the years they have actually been in operation

Sutlej Valley Project

29 The last four canals shown in the above statement belong to the Sutlej Valley Project, which consists of four weirs, three of which are on the Ghara reach of the Sutlej and one on the Panjnad The uppermost weir is at Ferozepore and from it takes off one perennial canal, which commands an area of 730,000 acres in the Bikaner State and two perennial canals which have replaced and extended the inundation canals known as the Upper Sutlej Series on the right bank and part of the Grey Canals on the left bank The second weir is at Suleimanke and controls three canals, on the right bank the Pakpattan Canal which will command about 700,000 acres in the Nili Bar, on the left bank there are the Sadiqia Canal which

commands 900 000 acres of land in the Cholistan desert of Bahawalpur State and the Fordwah Canal which will irrigate and extend the area formerly irrigated by the inundation canal. The third weir is at Islam and also controls three canals. The Mailsi Canal on the right bank protects the irrigation formerly done by the series of inundation canals known as the Lower Sutlej Series, and will in addition extend non-perennial irrigation in certain areas of crown waste formerly desert. On the left bank the Bahawalpur Canal serves the dual purpose of irrigating land in Cholistan and protecting the area formerly irrigated by several small inundation canals in addition, there is the Qaimpur Canal which is a small non perennial canal serving the old inundation canal tract.

The above three weirs were completed and brought into action during the period covered by the census. The fourth weir is at the Panjnad below the confluence of the Sutlej and the Chenab This weir has only been recently finished and will control two canals. The Abbasia Canal is a small perennial channel designed to irrigate a further block of state waste in Cholistan. The Panjnad Canal is a large canal which will protect and extend the irrigation from the series of inundation canals in Bahawalpur which take off from the Chenab and Indus.

The whole Project commanded a gross area of 3 400 000 acres in the British Territory 3 000 000 acres in the Bahawalpur Territory and 700 000 acres in the Bikaner Territory Some of the land in Bahawalpur has on further examination not been found suitable for irrigation, so that the final figures of this portion will be different from the above. The actual irrigation in 1930-31 is less than the final figures of irrigation contemplated as the canals are expanding and the area is not yet completely settled. The actual irrigation in 1930-31 amounted to 1 300 000 acres in British Territory 725 000 acres in Bahawalpur Territory and 330 000 acres in Bikaner Territory

Water Logging.

While the canal irrigation has enhanced the prosperity of the Province to such a remarkable extent it must be mentioned that the canals have not proved an unmixed blessing In several districts, particularly in Sheikhupura Gujranwala Sialkot and Gujrat, water logging conditions have been brought about during the last decade and a considerable area has been thrown out of cultivation As a result of remedial measures, adopted by the Irrigation Department a portion of the water logged area has been reclaimed during the last few years. These measures consist of drains, dug to carry off the seepage water closure of canals for prolonged periods and the running of canals low as far as possible. The *reh* area by which is meant the land submerged under water or rendered uncultur able owing to the great rise in sub-soil water has benefitted by these measures For the reclamation of the *thoor* stricken area, rendered unfit for cultivation owing to the salts in the soil having been forced up by the rise in sub-soil water a cure has been found but it has yet to be seen whether it would be economical. Govern ment has been giving the matter its serious attention, and the whole question of water logging is being considered by the Water logging Board, which consi ts of the Financial Commissioner Revenue (President) and the three Chief Engi neers and the Directors of Agriculture and Public Health (Members) The Board holds quarterly meetings and a conference is convened annually under the presidency of the Governor himself to review the situation.

Trade.

30 The statistics of imports into and exports from the Punjab are not available In the absence of these statistics we have to take into consideration

Year	Imports	Exports
1920-21	3,355,900,000	2,400,100,000
1921 22	2,663,400,000	2,313,800,000
1922 23	2,327,000,000	2,991,600,000
1923-24	2,276,100,000	3,488,300,000
1924-25	2,466,200,000	3,846,600,000
1925-26	2,261,700,000	3,748,400,000
1926 27	2,312,200,000	3,014,300,000
1927 28	2,498,300,000	3,191,500,000
1928-29	2,533,000,000	3,301,200,000
1929-30	2,407,900,000	3,108,000,000

the imports and exports for the Indian continent The marginal statement shows in rupees the foreign trade of India in the last decade It will be observed that the balance of trade was unfavourable in the years 1920-21 and 1921-22, the imports being in excess of exports, but the situation thereafter improved and the balance was in favour of exports, which were 50 per cent in excess Since then, while both imports and exports have shown considerable fluctuations India has enjoyed a favourable balance of trade, though during the last two years (1930-31 and 1931-32) both imports and exports have fallen heavily as shown in the margin The extent to which India has been affected by the world-wide trade depression is indicated by the fact that in 1931-32 both imports and exports were nearly half those for the year 1929-30 On the whole the conditions of trade during the decade were favourable until the recent depression set in.

Year	Imports	Exports
1930-31	1,648,200,000	2,204,900,000
1931-32	1,263,400,000	1,558,800,000

31 The decade 1921-31 witnessed a considerable advancement in the industrial and economic progress of the Province Transport facilities were largely augmented by the opening up of new railway lines, extension of metalled roads, provision of sidings to large mills and factories and private enterprise in motor lorry service But by far the most important project towards the industrialisation of the Province, which was undertaken during the decade, is the Mandi Hydro-Electric Scheme The statement in the margin shows the number of factories coming under the purview of the Indian Factories Act and the number of persons employed therein from year to year It is evident that the number of factories and the number of operatives employed therein steadily increased with slight fluctuations up to 1928 when the general trade depression began to make itself felt The number of factories in 1928 had nearly doubled since 1921 A corresponding increase has, however, not taken place in the number of operatives, partly due to the fact that in the large factories, such as Railway workshops, labour-saving devices and other improvements having the same effect were introduced, and partly to the fact that many small factories were set up in diverse industries, which had received scant attention in the previous decade, such as hosiery factories, iron and steel-rolling mills, foundries, oil-mills, flour-mills, rice husking mills, etc

Industry

Year	No of Factories.	No of Operatives
1921	297	42,428
1922	366	46,588
1923	399	49,110
1924	434	50,842
1925	527	53,533
1926	548	52,648
1927	546	50,088
1928	559	51,613
1929	521	49,875
1930	526	49,549

The geographical position of the Province and the large distance from the nearest seaport constitute a serious drawback, and the production in the Province is largely limited to the supply of local requirements A small amount of trade is, however, done across the frontiers with Afghanistan on the west and Tibet and China in the east, but the amount of such trade is almost negligible The internal production has, however, increased considerably as is evidenced by the increase

in the number of factories as shown on the last page. The increase in different kinds of factories is shown below —

Class of Factories.	No. in 1931.	No. at the close of 1931.
Cotton, spinning and weaving	3	6
Woollen mills	2	3
Hosiery		6
Food, drink and tobacco	24	56
Chemicals, dyes, etc. (including oil-mills, soap factories, etc).	2	13*
Printing presses	8	20
Processes relating to wood, stone and glass	3	9
Cotton ginning, leading and pressing	212	291
Minerals and metals (including foundries, petroleum refineries and subsidiaries)	7	24
Engineering		12

*Of these 7 are oil-mills.

In addition to the factories coming under the purview of the Indian Factories Act, a large number of smaller factories chiefly soap works, hosiery factories, handloom weaving factories, foundries, flour and rice mills, chemical works, printing presses, furniture making factories, *durree* making factories, tanneries, etc. have been established during the decade.

Foundries.

The foundry oil-milling, weaving and hosiery industries received considerable impetus during the decade. The particular feature of the growth of the foundry industry which is localised at Batala Ferozepore, Bhiwani, Farrukhnagar Lahore, Lyallpur and Amritsar is the manufacture of improved agricultural tools and implements and industrial machinery including oil engines and parts thereof The foundry worker has acquired a large measure of skill both as a result of facilities for training of efficient foundry workers provided in Government Industrial Schools and Institutes and of the general demand made from him by factory owners. The observation made in the last Census Report that enormous waste resulted in the Province due to machinery being out of action while spare parts were being awaited does not hold good now Spare parts of almost every description are available, being made at local foundry works. The Government Metal Works Institutes at Ambala and Sialkot, the latter of which has been started since April 1932 specialise in the training of mechanics and engineers.

Oil-Milling.

As regards oil milling industry the Department of Industries is devoting special attention to this subject. A large factory for the hydrogenation of oils and preparation of vegetable *ghi* has been set up at Lyallpur and is working successfully Although the oil industry was badly hit owing to the general trade depression in the last two or three years of the decade it is hoped that the research conducted in the Department will place useful data in the hands of the industrialists engaged in oil-milling to improve the quality of their products and to produce chemical oils for industrial purposes.

Spinning and Weaving.

The decade was marked by a revival of the Swadeshi movement which provided a fillip to the hand weaving and hosiery industries. The industrialists engaged in these industries made good profits especially those engaged in silk weaving and woollen hosiery A large number of handloom weaving factories were started for meeting the local demand, and the preference shown by the people for fabrics of local manufacture made it possible for factory owners to increase their output. The Mela Ram Cotton Spinning Mills, which remained closed for a considerable period, started working in the last year of the decade on account of the demand for country-spun yarn. Some of the leading industrialists of the Province have in hand projects for setting up large spinning and weaving mills in the Province and it is hoped that these will materialise before long

Hosiery.

The hosiery industry held its own against the keen competition from China, Japan and continental countries in woollen goods Many of the hosiery factories have installed power-driven machinery The Government Hosiery Institute Ludhiana, provides the necessary facilities for turning out expert workers, in the supply of marketable designs and in fitting and setting up of machinery

Sugar Industry.

The sugar industry received a great impetus during the last three years of the decade The most important flotation was the Punjab Sugar Corporation which was launched with an authorised capital of 10 lakhs divided in 10,000 shares of Rs 100/- each The Punjab Government purchased non-cumulative preference shares worth Rs 1,50,000 The factory started working towards the close of the decade As a result of the grant of protection to sugar industry for a period of 7 years, about one dozen small scale factories for the manufacture of sugar by the open pan system were set up during the last two years of the decade

Cottage Industries.

The cottage industries of the Province and artware industries showed fair progress during the early years of the decade but with the setting in of the general trade depression in 1928, they received a severe set-back The trade in carpets and general artware dwindled into insignificance

Conclusion.

As in the previous decade, the demand for industrialisation came from those seeking to employ capital and from middle classes seeking employment outside the overcrowded literary professions This tendency is a happy sign of the times Agriculture is an industry, which is subject to decreasing returns The labour drawn into industrial concerns from the agricultural population benefits by coming to the towns, and at the same time relieves the pressure on agricultural land A real need of the Province is the introduction of cottage industries among agriculturists to provide employment during off-seasons With reference to the remarks in the last Census Report in this connection, it may be noted that particular industries are no longer the monopoly of particular castes For example, it is now a matter of common knowledge that a weaver's son gives up his hereditary profession and becomes a tailor, while a blacksmith's son takes up carpentry as his occupation The instinctive bias for a particular industry has to some extent lost its hold

Two New Sources of Wealth.

32 Two new sources of wealth, in importance second only to the Salt Mines at Khewra, have become available for the Province during the last decade These are the Petroleum wells at Khaur in the Attock District and a hill of rich limestone at Wah in the same district from which cement can be manufactured with comparative ease A description of these industries, supplied by the managers of the companies concerned, appears below

Petroleum Wells

The petroleum field is located centrally between the villages of Khaur, Ahmdal and Kamlial in the Pindigheb Tahsil The first well was spudded in by cable in November 1914 Oil was found in commercial quantities at 144 feet and the well was put on production at 452 feet, flowing 350 barrels of oil per day from this depth The development of the field was retarded by the conditions brought about by the war, though drilling proceeded continuously Up to the present, 170 shallow and deep wells have been completed Most of these are less than 600 feet deep, while one well is more than a mile in depth As with all the other known occurrences of oil in India, Burma and the neighbouring countries, the oil occurrences of the Punjab are confined exclusively to rocks of Tertiary Age Tertiary rocks underlie the whole surface of the Pothwar plateau, fringed on the north and south by Mesozoic and older rocks, which form the main mass of the

northern hill range and outcrop in a thin ribbon along the scarp of the Salt Range. The oil bearing rocks which have been penetrated by the drill at Khaur consist entirely of upper and lower Murree beds, of Miocene (Hevetian to Burdigalian) Age. Oil is found at a great number of levels, of which the most highly productive are known as the 400 foot sand, the 1 600 foot sand the 3 100 foot sand the 3 900 foot sand and the 4,800 foot sand. Water is also present frequently in large volume, the main water sands being known as the 500 foot, the 2,800 foot and the 4,300 foot sand. Attempts have been made to stimulate production by "shooting by the application of vacuum, and the injection of air or gas under pressure, but the results achieved have been meagre The shallow wells—that is, those less than 2,000 feet in depth—are pumped by means of central powers driven by electric motors and gas engines, while the deep wells either flow naturally or are pumped "on the beam" by electric motors. The hardness of the strata has rendered drilling a slow and expensive proposition, although the Company has kept well abreast of modern practice. At present with the most modern and high powered rotary drilling equipment it takes six months to drill a well to 4 800 feet depth.

The greatest difficulty in the present development of the field is caused by the extremely high pressures encountered. Measurements made in some of the deep wells give records very much exceeding the hydrostatic head of a column of water of equivalent depth. In one well nearly 5,200 feet deep the rock pressure is known to be at least 5 100 lbs. per square inch. The explanation given by the Company geologists for these extremely high pressures is that the rocks are still under the influence of the Himalayan folding movements. The means employed to combat the high pressures consist of the use of specially weighted mud fluid and of various mechanical devices allowing of drilling under pressure.

Since the refinery was opened in 1922, annual production has been as given in the margin. The crude is refined into the following products Petrol Kerosene, Lubricants, Diesel Fuel, Wax and Candles. A 6" diameter pipe line conveys the crude oil from the oil field to the Company's Refinery at Morgah, near Rawalpindi, a distance of 42 miles.

Production of the field by years.

Year	Barrels of 40 Imperial Gallons.
1922	182,904

1924	288,843
1925	201,180
1926	186,538
1927	246,490
1928	200,334
1929	180,222
1930	191,544
1931	158,843

Cement Works.

The cement works are situated at Wah, a railway station on the North Western Railway between Rawalpindi and Campbellpur The Managing Company started working in May 1922, and the figures in the margin give the annual output of cement since 1923 The exports from this Company have so far been limited to various districts within the Province

Joint Stock Companies.

33 The last decade witnessed an appreciable growth in joint-stock enterprise. The table on the following page shows the number of new companies registered and their nominal capital for the last two decades the number and capital of companies which went into liquidation or were otherwise dissolved and

the average number and capital of companies existing at the end of each year in the two decades

1	2		3				4			
	New companies registered		Companies which were liquidated or otherwise dissolved				Average Number of Companies and Capital existing at the end of each year.			
Year.	No	Capital (0,000's omitted) Nominal	No	Capital (0,000's omitted) Nominal	Subscribed	Paid up	No	Capital (0,000's omitted) Nominal	Subscribed	Paid up
1911 12 to 1920 21	159	7,653	194	8 253	2,018	943	1097	5,783	2,989	2,208
1921 22 to 1930 31	337	14,320	150	6,331	2,338	1,689	1827	12,268	4,613	3,148

The above table reveals some interesting features of the development of joint-stock enterprise and the commercial and industrial life of the Province In the first place, it will be observed that whereas the total number of new companies registered during the last decade was more than double the number of new companies registered during the previous decade, the increase in nominal capital was slightly less in proportion The average nominal capital of the companies existing at the end of each year, shown in column 4 of the table, gives an increase of 112 per cent , the average increase in the number of companies being only 65 per cent The subscribed and paid up capital, which is a true index of the financial position of a company, showed an increase of 54 per cent and 37 per cent respectively, as compared with the 65 per cent increase in the number of companies The fact that the subscribed and paid up capital did not keep pace with the increase in the number of companies was due partly to over-caution on the part of the average investor, imposed by his past sad experience, and partly to uncertain trade conditions towards the close of the decade While the average nominal capital of companies which went into liquidation in the two decades ending 1920-21 and 1930-31 was about the same, *i e*, Rs 42 5 lakhs, the average subscribed and paid up capitals during the last decade were higher, *i e*, Rs 15 6 and Rs 11 3 lakhs as compared with Rs 10 4 and Rs 4 9 lakhs, respectively, for the previous decade This is accounted for by the fact that the companies which went into liquidation had larger subscribed and paid up capitals

The number and capital of the companies in existence on 31st March each year are shown in the following statement, which also gives similar details in respect of new companies registered and companies which were liquidated or ceased to work in each year —

Year	New Companies Registered				Companies which were liquidated or otherwise dissolved				Companies existing at the end of the year			
	No	Capital (0,000 s omitted) Nominal	Subscribed	Paid up	No	Capital (0,000 s omitted) Nominal	Subscribed	Paid up	No	Capital (0,000 s omitted) Nominal	Subscribed	Paid up

1928 29	36	1,046			11	144	21	4	212	1,366	571	387
1929-30	57	1,476			17	508	165	40	252	1,463	575	397
1930 31	56	995			23	1,327	616	471	285	1,435	518	367

Note —In the year 1921 22, two companies were transferred from Delhi to the Punjab and in the year 1922 23 one company was transferred to Bengal and one company from Bengal was transferred to the Punjab In the years 1923-26, one company was transferred to Bengal and three companies were transferred from Delhi to the Punjab and in the year 1926-27, one company was transferred to Delhi and two to United Provinces

The table shows that the revival which set in in the year 1920-21 was maintained in the succeeding two years, followed by a big increase in the number of new companies registered in the year 1923-24 after which there was a lull for two years. From 1926-27 onwards the number of new companies rose from 29 in 1926-27 to 36 in 1928-29 and then by a rather sudden leap to 57 in 1929-30

The decade was not marked by any serious financial crisis or bank failures. The abnormal number of failures in the last year of the decade was apparently due to the continued trade depression, which also resulted in an increasing *tendency among capitalists to withdraw rather than invest money* During the whole of the decade most of the new flotations were minor trading concerns and joint-stock organizations, with a tendency to group themselves into commercial and banking corporations rather than into industrial organizations. The last two years were remarkable for the increased interest in the flotation of loan companies.

The nature of companies in existence in 1921 and 1931 is shown in the table below

Nature of Company		No.	Capital 0,000' omitted. Nominal.	Subscribed.	Paid up.
Building and Loan	1921.	25	4 73,6	—,73,2	2,20,3
	1931.	24	4,83,4	—,03,1	1,01,1
Insurance	1921	4	30,0	16,7	8,0
	1931.	1	78,1	36,8	6,8
Transport	19..1.	4	9,8	—,6	2,0
	1931	4	6,5	1,3	1,3
Trading and Manufacturing	1921.	44	1 07,2	34,8	23,8
	1931.	191	4,55,3	1,4—,2	1,04,4
Mills and Presses	1921.	9	1,3	10,3	10,3
	1931.	15	1,46 8	57,0	30,3
Mining and Quarries	1921.	2	3,3	3,1	3,1
	1931.	3	6,6	1 8	1,3
Estate Land and Building	19..1	—	1,3	2	1
	1931.				
Breweries and Distilleries	1921	3	3—,9	22,9	3—9
	1931	2	28 0	24 0	24,0
Sugar	1921	1	4	4,6	4 6
	1931.	0	44 0	23 9	23,3
Hotels, Theatres and Entertainments	19..1	3	34—	43,4	49 4
	1931.		93,4	41 4	42,6
Others	1921.				
	1931.	1	1,0		

It is evident that there was an increase in the number of companies in all branches of business, excepting breweries and distilleries which decreased from three in 1921 to two in 1931 Estate land and buildings, the two companies existing in 19 1 were wound up eight years later The number of transport companies remained stationary Among other classes of companies, insurance companies have multiplied 3—5 times and trading and manufacturing *companies 4 41 times.*

The number of mills and presses companies has doubled, and that of sugar companies trebled Hotels, theatres and entertainments companies have increased from 3 to 8, and banking and loan companies from 25 to 28

During the decade 36 new banks were started and 32 were brought under liquidation The higher percentage of fall in the paid up capital of banking and loan companies was due to the failure of some banks with a higher proportion of paid up capital

The large increase in insurance companies is not necessarily a sign of satisfactory progress as a fairly large number of such companies has been started by men of small means and with little experience of their working The majority of trading and manufacturing companies are private limited companies as distinguished from public limited companies Most of these companies are working satisfactorily The increase in mills and presses and sugar companies indicates healthy growth The increase under hotels, theatres and entertainments is due to the flotation of film companies, which have received much patronage from the public during the concluding portion of the decade

The nominal, subscribed and paid up capital of all companies at the close of the decade was Rs 143,503,380, Rs 54,813,100 and Rs 36,655,924, as compared with Rs 108,301,940, Rs 45,128,850 and Rs 35,769,359 in 1921, respectively

The increasing interest evinced by the industrial and commercial community of the Province in joint-stock enterprise during the last ten years was due to the comparative prosperity and high level of prices during the first half of the decade The abnormal increase in the number of companies, which commenced in 1929-30, continues and as many as 80 companies, which is a record number, were registered during the year 1931-32 The flotation of trading and manufacturing and provident insurance companies is becoming more popular Companies falling under the former category are intended to further industrial objects, such as supply of pure *ghi*, silk and hosiery manufacture, manufacture of chemicals and drugs, export and import business and commission agencies On the whole the increase in the number of registered companies indicates an increasing realisation of the benefits of joint-stock enterprise During the decade undesirable and financially weak concerns continued to go into liquidation, but there is still a considerable number of spurious companies The continued increase in the number of companies indicates a return of confidence in their working, which was so badly shaken at the close of the previous decade It is anticipated that with the rise in the general level of prices and the end of prevailing trade depression, more capital will be diverted into joint-stock companies

34 The wages of agricultural labour continued to remain at a high level up to 1927-28 During this period an appreciable improvement was noticed in the position of labourers, which is evident from the fact that many landlords found it difficult to secure tenants A slight fall in wages was noticed in the year 1928-29, after which there has been a continuous fall in agricultural wages In his Report for the year ending 30th June 1931 the Director of Land Records, Punjab, remarked, "Wages of agricultural labour have gone down to some extent though not in proportion to the decline in prices" This remark is also true of labour employed in factories registered under the Indian Factories Act The figures quoted on the next page show the wages of various classes of workmen employed in factories during the last decade, and also compares them with the wages prevalent in 1911 and 1915 Wages

Statement of monthly wages (in rupees) of factory operatives

It will be seen from the above statement that wages reached the maximum limit in 1926 and remained stationary with very slight fluctuations till 1928 after which a gradual fall commenced in sympathy with the general trade depression and fall in prices. The downward tendency still continues as is apparent from the figures for 1931. It is also noteworthy that as compared to 1921 the wages in 1926 had increased by 33 to 50 per cent. for the various classes of workers. Even in 1930 they were about 20 to 23 per cent. in excess of those in 1921 though in the case of unskilled daily labourers they fell about 25 per cent. in 1931 as compared with 1921. The increase in wages since 1911 has been enormous, and in 1926 it was 100 to 400 per cent.

Prices. 35. The average price of wheat in the preceding decade (1911-20) was Rs. 4·298 per maund as compared with Rs. 5·186 for the 10 years ending in 1930 which gives an increase of 20 per cent. The highest price was reached in the year 1921 when it was Rs. 7·647 per maund. There was a fall in 1923 but thereafter till the end of 1929 prices ranged high. The course of prices has been similar in the case of inferior food grains. The price of cotton was very remunerative throughout the decade excepting the last two years when it fell suddenly like all other prices.

The average prices of food-stuffs are given in the table below for all the years of the decade.

Average annual prices in the Punjab expressed in rupees and decimals of a rupee per maund *

Year.	Wheat.	Rice.	Barley	Bajra.	Jowar	Gram.	Maize.	Salt.
1921	7·647	9·112	4·49	2·355	4·901	6·856	3·219	2·874

1930	3·161	6·72.	2··13	1··9·9	3··53	3·441	2·965	2·131

* Averages are based upon figures given in [illegible] of Years of Punjab Food Grain Prices by Professor Brij Narain as subsequently brought up to date by [illegible] of Economics Inquiry Punjab.

Cost of living

Index numbers of prices are not published by any agency in this Province It is, therefore, not possible to give an accurate idea of the general level of prices and their relation to wages As regards the relation between the fall in the prices of food grains and wages of agricultural labour, the opinion of the Director of Land Records, Punjab, has been quoted above But a large number of non-food articles enter into the family-budget of a worker regarding which no reliable information concerning the Punjab is available An idea of the fluctuation of prices may be formed from the table in the margin which shows annual movements in food, non-food and general wholesale prices in Bombay * It is evident that the actual index numbers of food and non-food articles for the Punjab would be different from those of Bombay but it may be assumed that the trend of the curve of index numbers for the Punjab would run on the whole almost side by side if not quite parallel to that of Bombay The above table shows a fall of 64, 63 and 64 per cent in food, non-food and general index numbers, respectively, in 1930 as compared with 1921 Assuming that the prices of food and non-food articles in the Punjab nearly fell to the same extent, we could safely say that while wages were still high in 1930 as compared with 1921, prices had gone down considerably, indicating that a labourer was better off than in the previous decade

Road Communications.

36 Whereas the increase in the mileage of metalled roads during the previous decade amounted to 318 (from 2,619 to 2,937 miles), the corresponding figure for the last decade is 1,136 miles or nearly four times as much, and the total mileage now is 4,073 miles These figures, however, do not indicate the actual development, which has taken place in the form of bridges over rivers and *nullahs* and inter-district connections being established in various directions The effect of such development on the agricultural and industrial life of the Province cannot be over-estimated

The first step was to reclassify the roads on a systematic basis and by the reclassification scheme sanctioned during the last decade 42 important lines of communication were arterialized Main roads of secondary importance remained with the local bodies The District Boards also maintained certain roads which were not included in the above two categories The total mileage of metalled road increased from 2,937 miles in 1920-21 to 4,073 miles in 1930-31 Important road-bridges were completed over the Chenab and Palkhu at Wazirabad, over the Beas near Dera Baba Nanak, over the Sutlej near Ferozepore, over the Chenab at Chiniot, over the Jhelum at Khushab, the weir across the Sutlej at Sulemanki, over the Bakrala Nallah in the Jhelum District, at Haro on the Grand Trunk Road in Attock District, over Binwan Khud in Kangra Valley, over Deg and Dehri streams and over the Bhimber near Gujrat A large number of smaller bridges was also constructed or rebuilt and boat-bridges were thrown across the river Chenab at Talibwala and a suspension bridge† over the Choi Nallah on the Pindigheb-Campbellpur Road A span of the Kohala Bridge on the Rawalpindi-Kashmir Road was washed away by the abnormal floods of 1929

*Bombay Labour Gazette Vol XI, No 8, April 1932 page 752
†The bridge was washed away in August 1929 soon after completion

thus impeding communication with Kashmir and is now (1932) under reconstruction. Considerable lengths of metalled roads have been treated with tar thus eliminating the dust nuisance and above all reducing the cost of maintenance Other improvements carried out consisted in widening the road lands and metalled widths, improving alignments, easing gradients, bridging gaps, and providing culverts on all the arterial roads in so far as it was possible to do so within the funds available.

It is now possible, although in some cases in fair weather only to motor between places such as :—

1 Lahore and Mianwali (*via* Sargodha and Khushab).
2 Lahore and Bhakkar (*via* Lyallpur and Jhang)
3 Lahore-Multan-Dera Ghazi Khan and Rakhni.
4. Delhi Hissar and Malaut.
5. Pakpattan-Multan.
6 Rawalpindi Khushalgarh and Kohat
7 Jhelum-Chakwal Talagang Pindigheb and Campbellpur
8. Jullundur Hoshiarpur Dharamsala.
9 Lyallpur-Sargodha.
10 Sialkot-Gujranwala Pindi Bhatian and Chiniot.
11 Toba Tek Singh Kamalia and Burewala.
12 Jhang Kabirwala

In addition, communications in the Nili Bar Colony area have been provided at a cost of over a crore. Quarries at Taxila Taraki, Wah, Warcha and Chandigarh were all developed to meet the increasing demand for stone metal.

The last year of the decade saw the inauguration of the Central Road Fund by which the Provincial Government received its share from the increased tax on petrol for development of roads.

The length of unmetalled roads in 1930-31 was 23 100 miles, and at the end of 1020-31 it was 20 719 miles. The decrease is mainly due to the fact that some of the unmetalled roads have been metalled during the last decade.

Unmetalled roads were also considerably improved. The policy has been to maintain larger length as a fair weather motorable road rather than metal smaller lengths and increase the recurring charges on their maintenance.

Motor Transport

An idea of the increased mechanical traffic can be formed from the figures of motor vehicles given in the margin, which have been supplied by the Police Department These of course do not contain figures of vehicles maintained for military purposes or those registered in other provinces and states while a number of the registered vehicles may not be actually in use.

Year	Motor Cycles.	Cars and Lorries.	Total.
1913	116	346	462
1914	136	221	357
1915	121	187	308
1916	14.	220	364
1917	191	24	42.

Railways Transport.

37 The increase in railway traffic has not been inconsiderable during the last decade although the great increase in motor traffic has been more in the public eye A keen competition has existed between the two but it seems that

things are now settling down, the railways being the carriers *par excellence* of heavy goods and long distance passengers and motor vehicles dealing with lighter goods and short distance passengers In the table in the margin is given the detail of new railway lines opened during the decade and their mileages

Year	New Railways	Mileage
1923 24	Kasur Pakpattan	86 80

Total	6 199 090	Total	8 173 608

The figures for 1930-31 show a falling off, and in 1931-32 there was a further decline when the number of passengers dropped to 58,608,100 or by about 32 per cent since 1929-30 This is mainly due to the general economic depression and also to the lorry competition

The table below shows the goods carried from all stations on the North Western Railway to Karachi

Statement showing the total arrivals into Karachi from N W R. Stations
(figures are given in tons)

Year	Wheat	Sundries	Other Grains	Cotton	Coal	Wool	Hides and skins	Bones	Oil-Commodities

Though these figures do not exclusively represent exports from the Punjab as railway stations in the United Provinces, Sind, Baluchistan and the North West Frontier Province are also included yet the share of the Punjab must be regarded as by far the largest. With further extension in road communications the possibilities of road transport acting as feeder to railways are almost unlimited.

Post Office, Telegraph and Telephone Service.

38 The postal and telegraphic communications have been considerably influenced by the general advancement of the Province during the last decade. The increase in the number of post offices during the decade amounts to 843 The total number of post offices at the end of the last two decades appears in the margin, as also the number of letters delivered in the Province for the period 1928-29 to 1930-31 Every town in the Province has now suitable postal facilities, and on an average every 13 villages enjoy the advantages of a post office. The number of telegraph offices has increased from 330 in 1921 to 524 in 1931 Every town in the Province has a telegraph office, and one out of every 97 villages is similarly equipped.

Year	Post Offices.	Letters delivered.

Co-operative Movement.

39 Paragraph 55 of the Census Report of 1911 describes the beginnings of the co-operative movement in the Punjab and paragraph 32 of the Census Report of 1921 deals with the progress made up to that year The movement has made great strides during the last decade as will appear from the account that follows.

In 1931 the total number of co-operative societies in the Province was 20 49 out of which 16,297 were agricultural credit societies with a membership of 499 314 In 1911 these agricultural credit societies numbered 1 071 spread over 23 district in 1921 the number had risen to 7 605 with a membership of 190 691 in every district of the Province The comparison in the margin will illustrate the increase of financial resources

The village credit society is then still the chief concern of the Registrar and his staff It is nevertheless true as remarked in the review for 1929 ten years ago the co-operative movement limited its activities to credit and supply and to a small extent to assistance to village artisans to-day it embraces most of the economic interests of the people" The potentialities of expansion can be gauged from the elements that go to form a co-operative credit association which

may be summed up as a voluntary association of individuals with unrestricted membership and collectively owned resources formed by small producers (or artisans, traders, or wage earners) conducted on a democratic basis under joint management and for mutual service by accumulating the savings of the members and granting them credit on easy terms by using the joint responsibility of its members as a security for loans obtained from outside, surpluses being placed to reserves In the Punjab an additional element of saving has been incorporated by the subscription of shares payable by instalments over a period of ten years after which they are returnable In the beginning three-quarters of the profits were divisible among members as non-returnable shares, and the remaining quarter was utilized to form a reserve fund, since 1918 the principle of indivisible profits has been incorporated in the by-laws Members are encouraged to start paying in another series of shares, or adopt a system of making compulsory deposits at regular intervals on which interest is paid

The encouragement of thrift and the advancing of loans only for legitimate purposes are the principles which credit societies seek to observe Every village society has its fixed maximum credit limit beyond which it cannot borrow. This limit covers the central bank loan and deposits of all kinds Loans are advanced to its members within their prescribed limits for the purpose of clearing off debt or for the purpose of financing the course of husbandry or meeting domestic expenses Recoveries are made at harvest on the basis of a fluctuating demand fixed in accordance with an estimated appraisement of the borrower's capacity to repay The table in the margin notes the volume of credit and repayment transactions from 1921 onwards These recoveries include payments on account of interest which is normally 12½ per cent The percentages of recoveries (principal) on the amount of loan outstanding at the beginning of the year reflect the economic strain which set in at the end of the decade These are quoted below

Agricultural Credit Societies

Year	Loans to Members	Recoveries
	Lakhs	Lakhs
1921	82 9	41 8

35	34	33	28	23	16

The volume of advances for the three years preceding 1928 began to make its cumulative effect felt, and the economic depression which set in at the end of 1929 caused a big slump in recoveries Societies were compelled to draw in their horns. At the end of 1931 loans outstanding amounted to 718 lakhs, overdue interest being about one crore The average debt per member (whether indebted or not) was Rs 144 in 1931, as compared with Rs 78/- ten years ago The Punjab Banking Enquiry Committee analysed in the beginning of 1930 the loan position in 3,341 societies It was found that only 13 per cent of the members were free of debt, 46 per cent did not borrow at all throughout the year, and on the average members took only about three loans each in two years The end of the decade saw business declining, a growing alarm at the burden of indebtedness, and recoveries presenting an increasingly difficult problem The owned capital of the societies has, however, trebled in the last ten years as shown in Lakhs of Rupees

in the margin. The element of allocation to reserve" is a powerful limb in the co-operative enterprise the societies now own 30 per cent. of their working capital but it is nearly all of it in the business.

In 1926 the classification of societies was revised in accordance with a resolution passed at the Conference of Registrars in 1926 The classification at the end of 1931 was as given in the margin A and B societies are efficient financially and more or less fully co-operative, C in varying stages of tutelage and D in various stages of decay

A.	B	C.	D	Unclassed.
293	1,071	11,683	1,350	966

The objects for which loans have been borrowed have been tabulated from time to time for representative societies. In 1931 an analysis of loans made in that year (in 1 9 3 societies) showed the distribution in the margin Enquiries are made annually into the condition of societies which have completed ten years of existence As an illustration of the achievements of such societies, the results of the enquiry in 1928 may be set down, the figures in the margin being for the preceding ten years. On this showing co-operative credit has materially strengthened the economic position of the members of these societies out of 82 584 co-operators, who are mostly land owners, 43 per cent were returned as being entirely free of debt. Co-operative credit does not necessarily mean cheap credit and nothing else Since 1928 consolidation rather than expansion has been the accepted policy and emphasis has been laid on the need of multiplying co-operators rather than societies and avoiding too rapid and precarious expansion. The need for such consolidation has been accentuated by the unparalleled economic storm which commenced at the end of 1929 The Punjab Banking Enquiry Committee in 1930 envisaged the goal of co-opertive credit being brought to the gates of every village in the Punjab within 15 years, but 60 per cent of the villagers are as yet untouched, and straitened finances and depleted or dislocated resources have now made that goal more remote Adjustments have become necessary and progress will be rather slow

Other types of primary agricultural societies as existing in 1931 are tabulated in the margin. In 1921 the main types were purchase and sale (1 1) arbitration (67) consolidation of holdings (60) and cattle insurance (37) out of a total number

Class of Societies.	No. of Societies.	No. of Members.
III. *Purchase and Sale Supply*	15	1,140

Arbitration	54	3,976

of 446 societies (including 45 night schools) The supply societies which in 1920 sold goods to the amount of 5 lakhs rapidly ceased to function with the return of normal conditions after the War To quote the Registrar " the work of purchase and distribution requires precision and punctuality and an understanding and practice of elementary business principles " All the arbitration societies were cancelled in 1923 under instructions from Government, but in 1925 a redraft was made of the by-laws, and the societies decided 371 disputes in 1931 These societies are now classed as non-agricultural, and they attempt to practice one of the most difficult forms of co-operation The cattle insurance societies were all cancelled in 1924 Adult schools have mostly gravitated to the District Boards Better farming societies with the object of popularizing improved seed and introducing improved implements were started in 1925 Cattle breeding societies have expanded in number during the past ten years but they are little more than associations of cultivators, who feel the need for better cattle but find it difficult to breed them Commission shops were first established in 1921 in Lyallpur replacing the cotton sale societies Their object, *i e*, to introduce co-operative marketing, is excellent, their working is surrounded with difficulties, and the number of shops (25) has not been increased in the last three years, during which the value of the produce sold has been Rs 4,74,130, the fall in the value being entirely due to the slump in prices A third of the custom still comes from non-members, and the supervision of these shops demands much time which the staff with its multifarious duties can ill afford The working capital in 1931 was over 7 lakhs

Consolidation of Holdings

The outstanding achievement during the past decade has been the progress made in the work of consolidation of holdings In 1920 Mr Calvert first drew up a scheme for a co-operative consolidation of holdings' society with voluntary membership involving certain obligations including the settlement of disputes by arbitration The movement has gone from strength to strength in a way that must be very gratifying to its founder In 1931, 142 new societies were founded, work was in progress in 13 districts and in 208 villages and the work done in that year is shown in the margin In 1920, 625 acres had been consolidated, in 1925, 10,411, and all told since 1920 336,283 acres have been consolidated at a cost of Rs 2 5 per acre all of which has been done by persuasion and persuasion only, but at the same time at the expense of Government, which in 1931 entertained 8 Inspectors and 124 Sub-Inspectors at a cost of 1¼ lakhs, *i e*, at a cost of Rs 1 12 per acre consolidated The benefits of consolidation are almost innumerable including provision of scope for sinking wells, preserving rainfall, bringing waste land under cultivation, stimulating the desire for better farming, increasing rent, decreasing the causes of litigation and quarrels, etc

Area consolidated	72 821 Acres
No of blocks —	
(a) before consolidation	117,982 „
(b) after consolidation	21,627 „
Increase in average size of a block	61 to 3 3 „

Mention has now only to be made of mortgage banks, and the review of the important group of agricultural societies is completed The first bank was registered in Jhang in 1921 In 1931 there were 12 banks, with the figures as in the margin Item (*a*) includes 5 lakhs of debentures issued by the Provincial Bank, and the balance is lent by Government Mortgage banks charge their borrowers 9 per cent The economic depression has made repayment of

instalments difficult and very difficult in places. Loans advanced to members declined as follows (lakhs) 6·3 (1929) 3·3 (1930) 1·5 (1931). It has been found necessary to reduce the amount of instalments and prescribe restrictions as to the maximum loan and the basis of calculation of credit.

Non-Agricultural Societies.

At the time of the last census, non-agricultural societies numbered 377 the principal figures being given in the margin. The most important societies (credit limited or urban societies) were the N W R. Employees Society and the Telegraph Department Society which supplied half the membership of this class. In 1931 the credit societies numbered 92 (limited) 1 019 (unlimited) with a membership of 54 715 and a working capital of over one crore. Half of these societies are urban and half rural but over two-thirds of the membership is urban. Thirty nine societies are societies in Government offices, and since 1926 many traders credit societies have been registered in towns. The N W R. Society and the Telegraph Department Society between them account for 13 300 members and Rs. 36 lakhs working capital. In these societies membership covers a catholic range

Societies.	Members	Working capital (Lakhs).
Weavers	55	1,197	1·2
Credit unlimited	169	3,491	6
Credit limited	70	4,290	5·1
Supply	82	7 192	1·7
Thrift	38	653	·7

Thrift Societies.

Thrift societies now number over a thousand with nearly twenty thousand members contributions and deposits totalling 11·8 lakhs. In this number women societies are included, i.e., 104 with 2 871 members, and a working capital of 1·4 lakhs. Women societies were first started in 1925 with varying fortunes.

In 1920 there were 112 urban supply societies but they have generally failed to hold together and in 1931 the number had declined to 18 the most not able being the Dhariwal Woollen Mills Society (membership 3,318 turnover 4 lakhs)

Industrial Societies.

Industrial societies now number 314 (including 192 weavers societies) It was after 1925 that industrial societies other than weavers began to be registered. Membership in 1931 was 5 721 with a working capital of 0·7 lakhs (owned capital 2 lakhs) value of raw material advanced 1·1 lakhs, value of members goods sold 1·1 lakhs. The supervising staff is paid by Government. The economic position of the handloom weaver has sadly declined in the past decade Marketing is a difficulty which the setting up of a sales depôt in Lahore has done little to solve and even the business of supplying raw material at the cheapest possible rate calls for much improvement. These societies are financed by the Central Industrial Bank, Amritsar which has grown out of the original Weavers Central Co-operative Store Amritsar

Better-living Societies.

Better living societies are a new feature which shows every sign of life. In 1931 the societies numbered 359 with a membership of 13 000. With credit till dominating everything else thrift is beginning to gain ground and credit societies are incorporating rules with the object of reduction of expenditure on social ceremonial and the like

Compulsory Education Societies.

Arbitration societies have been noted elsewhere and it only remains to mention compulsory education societies which are dwindling in number (101 in 1931)

Central Financing Institutions

In 1920 there were 27 central banks and 50 banking unions. The number rose to 112 in 1923 since when it has remained stationary. In 1931 the working capital of 94 institutions was 129·6 lakhs out of which the owned capital amounted to 40·8 lakhs. In 1923 the working capital had nearly trebled. The table in the margin which gives the financial position in 1931 displays the progress made during the decade.

1931.	Central Banks.	Unions.
Number	47	65
No. of members :—		
(a) individuals	3,333	
(b) societies	12,771	3,040

Reserve Funds	22·1	4·6
Working capital	808·3	94·8
Profit of the year	8·6	·6

There is in addition the Central Industrial Bank plus six industrial unions (working capital 6 lakhs). Unions are financially much less important than the bank co-operatively they frequently put the banks to shame. As a rule they operate within a radius of 10 or 15 miles, whereas banks are district (some tahsil) institutions. Many of the older unions are homely and staunch affairs which carry on unperturbed by any disturbances in prices or credit. Central banks are the main financial arteries of the movement. They are the focusing points for the finances of a wide range of societies. Their function is to get into touch with the savings of the man in the street and the man in the village and the accumulation of funds should be their first task. Security redeemability and liquidity of position are three primary objectives. Lahore Jullundur and Lyallpur had a working capital of Rs. 77·03 40·10 and 30·88 lakhs respectively in 1931.

Traders	62
Women	32
Minors	31

As regards their function of securing deposits, the analysis of the 1931 position was as shown in the margin. As regards their complementary business of lending to their member societies the amount on loan at the end of 1923 was 230 lakh in 1931 (August) 389 lakhs. The economic depression however was responsible for a decline in the amount advanced in that year from 373 lakhs in the previous to 89 lakhs. The percentage of overdue i.e., on the basis of a demand as assessed every harvest loans in accordance with societies estimated capacity to repay has up to 1929 been steady for several years at 14 per cent. The slump in prices however has performe for the time being transformed short credit into medium credit. In 1930-31 the demand from primary societies was fixed at 1 11 lakhs or under one-fifth of the amount out on loan. This consideration to clients resulted in most of the demand being paid but the arrears of interest mainly owing to lean years in the south east Punjab have been swelling uncomfortably.

The margin between borrowing and lending rates in a central bank is usually about 2 per cent. or just above. Working expenses are about half per cent of the working capital. Savings bank accounts are encouraged and in towns where there is no commercial bank, bill etc are collected. Branches have been opened

Proper attention has been paid during the last decade to the education of girls. The marginal statement shows the number of girls schools now and ten years ago.

Technical Education.

Technical education has also made a distinct advance during the last decade. The opening of the Maclagan Engineering College at Moghalpura in October 1923 met a long felt want by rendering possible the supply of properly trained electrical and mechanical engineers. A lead was also given in technical training by the opening in 1923-24 of a Government Dyeing and Calico Printing School at Shahdara. An up-to-date tannery for imparting education in modern methods of tanning was also started at Shahdara in February 1925 but had to close down two years later as it was running at a loss. The number of industrial schools where minor crafts such as carpentry smithy weaving and pottery etc., are taught has increased from 10 with 1 731 scholars in 1921 to 28 with 4,336 scholars in 1929-30

Panchayat System.

41 With a view to ameliorate the condition of the rural communities and to educate the people in the art of self-government, Government decided to revive the ancient system of *Panchayats* in the Province. The legal sanction to the system was given by the passing of Punjab Village Panchayat Act in 1921 which provided for the establishment of *Panchayats* consisting of members or *Panches* to be elected by the people of a single village or group of villages.

The main object of *Panchayats* is to settle petty civil and criminal disputes that may arise among the villagers, and thus to save them from the evil effects of protracted litigation. Other main duties are to improve the conditions of village life and to look after the sanitation, *e.g.* the construction and maintenance of wells, tanks, drains, roads, etc The *Panchayat* are moreover required whenever Government so desires, to arrange *thikri pahra* (patrol duty at night) to regulate *warabandi* " (fixing the turns and duration for taking canal water) and to act as school committees. In addition to these multifarious duties the *Panchayats* might take upon themselves the duties, which are optional of improving agriculture, agricultural stock cottage industries and maintenance of libraries the prevention of nuisances, and the supervision of the conduct of pat waris and other petty officials. The *Panchayats* thus have a wide and useful range of activities.

The system as contemplated by the Act was slow to take root and it was considered necessary to start propaganda for its encouragement. With this object in view a conference of officials and non-officials was convened in Lahore at the end of 1926 As a result *Panchayat* officers were appointed in selected districts with a view to explaining to the people the advantages of *Panchayat* system. The number of *Panchayats* has been on the increase since 1926 though some of them had to be abolished because of feuds or local jealousies, which made it impossible for them to function or where qualified men were not forthcoming for being elected as *panches* In the margin is shown the number of *Panchayats* during each year of the decade

	Year	Number
At the beginning of	1921	249
During	1922	273
Do	1923	309
Do	1924	326
Do	1925	371
Do	1926	433
Do	1930	733

Fees and fines and a few voluntary contributions are almost the only source of revenue, but in the case of a few *Panchayats* village and special rates are also imposed

Most of the *Panchayats* did not become fully conscious of their duties and responsibilities until the end of 1924-25 and consequently the outturn of work was meagre On the other hand some of the *Panchayats* gave a good account of themselves The 64 *Panchayats*, which were empowered to try criminal cases, disposed of 854 cases involving 1,333 persons, and 84 *Panchayats* empowered to deal with civil litigation heard 3,210 suits and disposed of 2,020 With the lapse of time the outturn of the *Panchayats* has further increased By 1929-30 the number of *Panchayats* had risen to 733, the number of civil and criminal cases disposed of being 3,657 and 10,540, respectively

Rural Uplift

42 This movement is of recent growth, being initiated by Mr Brayne in the Gurgaon District in 1921 The uplift work was started in almost all the districts at one time or other It aimed at—

(*a*) *improving the farming,*
(*b*) *cleaning the villages,*
(*c*) *making the houses neat and airy,*
(*d*) *taking precautions against epidemics, and*
(*e*) *making the home sweet and beautiful*

The methods adopted by Mr Brayne towards the attainment of these objects were as follows —

The necessity of introducing modern implements of agriculture and using good seeds was explained to the cultivators The conservative *zamindar* of Gurgaon was not easily to be won round, and it required prodigious labour and propaganda work to persuade him to take to modern appliances Pits were dug in villages for storing manure Magic-lantern shows and lectures were arranged to educate the masses in keeping their houses clean and well ventilated Female education was introduced in villages and parents urged to send their daughters to schools for boys as long as separate schools for girls were not started By the year 1928, about 1,500 girls had joined their brothers in the village primary schools Besides the imparting of primary education the girls were taught knitting, sewing, ironing and first-aid work The schools of Rural and Domestic Economy were opened for the training of men and women, so that they might go out as missionaries into villages and teach the people how to make themselves happy and prosperous Village Guides were appointed, one in every *zail*, to help the *zamindars* in their troubles and to do uplift work Adequate arrangements were made, through the Health Department, for inoculating men and cattle against epidemics Approved stud bulls from the Hissar Cattle Farm were introduced to improve the stock of the district both for draught and milk purposes The figures below indicate the extent to which these measures were successful in ameliorating the social condition of the agriculturists of the district

		1921	1927
Approved stud bulls in use		8	557
Hissar heifers			123
Iron ploughs			1,600
Iron persian wheels			800
Re-afforestation of hills	acres	1,325	6 780
Area under SA wheat	Do	Do	36,750
Co operative Societies		153	822
Members		3,303	19,126

		1921	1927
Working capital	Rs	130,224	Rs 2,288,041
Hospitals		11	24
Pits 6 feet deep for village refuse and manures, &c			40,000
High schools		3	4
Boys in schools		10,839	26,744
Girls in boys' schools			1,334
Night schools			152

Rural Uplift Work by Y. M. C. A.

The Provincial Y. M. C. A. organization is also carrying on the village uplift work. It has opened a Rural Re-construction Centre at Vaniake (District Amritsar) *since September 1930 The main object is* to develop a programme of rural re-construction suited to the Punjab conditions. This uplift work is different from Mr Brayne's in that it is concentrated in a small area and efforts are made to bring to bear on the locality all possible forces of uplift both official and non-official. A considerable progress has been made in improving the sanitary conditions by the introduction of *pucca* drains and a simple type of latrine which is new to the Punjab. A District Board Co-education Primary School has been started and a very effective *Panchayat is set up Sports, games* lantern lectures, wireless receiving set, reading room, model poultry farm, etc. are included in the programme. An endeavour is being made to draw out the initiative of the villagers and to develop among them the idea of self help. The organisers hope at no distant date to open a training centre at Vaniake for rural workers.

Undoubtedly these activities have so far touched the mere fringe of the population but they have at least succeeded in pointing out the extreme necessity and *usefulness of the uplift work and the direction in which it can profitably* be carried on. An essential condition for the success of the movement is that the effort should come from the people themselves, and it is for the leaders of thought in the Province to take up the work in right earnest and to ameliorate the conditions in which the bulk of the population lives.

The Mandi Hydro-Electric Scheme.

43. Of all the schemes undertaken to supply the Punjab with electric energy the Mandi Hydro-Electric Scheme is by far the most important. Work on *this scheme was started in 1926 and is now rapidly approaching completion* It is expected that the spring of 1933 will see many towns in the Punjab electrified and cheap power for industries and home consumption available even in out of the way places. The scheme consists of tapping the waters of the Uhl river a tributary of the Beas, passing it through a mountain by means of a tunnel 2¾ miles long and 6½ feet in diameter and dropping it by *means of two steel pipes* down the hill-side 2 000 feet to Jogindar Nagar (in Mandi State) where the power house is situated. The water will operate four generators which will pass their electrical energy on to a transformer station and by means of over 400 miles of transmission line to various parts of the Punjab.

The total cost incurred up to the 31st March 1932 is Rs. 382·46 lakhs the figures for the two principal items are quoted below:

(1) *the tunnel* ... *Rs 81·05 lakhs*

(2) *the trunk and branch transmission lines* ... *„ 117·26*

No other scheme hitherto launched has such far reaching *possibilities as* the Hydro-electric Scheme. As at present estimated power for industrial purposes will be available at one-third the present rates and for lights and fans at half the present rates. The scheme is thus expected to give a great impetus to a general industrial development in more ways than one.

Broadcasting.

44. Broad-casting is one of the wonders of the present age. It enables an audience by means of radio to hear from incredibly long distances speeches, music commercial news etc. *It is the cheapest* and the quickest means of approaching the public. Broad-casting sets can be fixed up in hundreds of towns and villages and enable their possessors to hear from a central transmitting station simultaneously. This method of education is more effective than any other kind of propaganda—press, platform or the screen. Any knowledge imparted by this means

among the illiterate masses of this Province, who cannot be taught by any other means, can surely be regarded as of inestimable value At the present moment the only transmitting station in the Province, which was opened in Lahore in October 1930, is maintained by the Young Men's Christian Association and functions only from October to May It can be picked up regularly throughout the central Punjab and occasionally in the whole of the Northern India The total number of receiving sets in the Province is about 1,500

Broad-casting is still in its infancy in the Pun ab, but in view of its increasing popularity it has, I believe, a great future before it

SECTION 6.—MOVEMENT OF THE POPULATION.

Increase in the Population

45 Having summarized in the last section the progress made by the Province in several directions we may now examine the intercensal increase in the population The population of the Punjab has increased during the last decade by 3,389,343 or by 13 5 per cent , which is a rate of growth higher than that recorded at any previous census The increase in British Territory amounts to 2,895,374 or 13 9 per cent and that in the Punjab States to 493,969 or 11 2 per cent During the last fifty years the population of the Province has risen from 20,800,995 to 28,490,857 or by 37 per cent The corresponding figure of increase for British Territory is 6,641,540 or 39 2 per cent and for Punjab States 1,048,322 or 27 1 per cent The table below shows for the Punjab and some of the principal foreign countries the actual rise in population since 1881 together with the percentages of increase

Country	1931	1881	Variation	Percentage
Punjab	28,490,857	20,800,995	7,689,862	37·0
" *British Territory*	*23,680,852*	*16,939,312*	*6,641,540*	*39 2*
" *Punjab States*	*4,910,005*	*3,861,683*	*1,048,322*	*27 1*
India	352,837,778	253,896,330	98 941,448	39 0
England and Wales	39,988,000	25,974,439	14,013,561	54 0
France	41,860,000	37,672,048	4,187,952	11 1
Sweden	6,162,000	4,565,668	1,596,332	35 0
Japan	64,700,000	35,769 000	28,931,000	80 9
United States of America	124,070,000	50,156,000	73,914,000	147 4

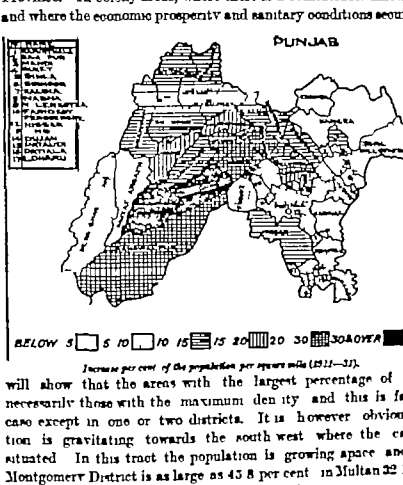

During the last fifty years the population of this Province has risen by a percentage almost equal to that of India The rate of growth is, however, much smaller than that of England and Wales for the same period, although the latter lose much of their population by emigration France, which has the smallest rise of all civilized countries, is of course an exception The rise in Sweden is about the same as in India, and it would have been much greater but for large emigration to America The rise in Japan, which is due more or less to natural causes, is twice as much as in the Punjab, while the extraordinary rise in the population of the United States of America is nearly four times as much

The increase during the last decade is phenomenal, and was certainly not expected, particularly when it is realised that the number of deaths caused by the influenza epidemic of 1918 in British Territory alone was about a million, out of which the deaths in the reproducing section (aged 15—40) were 417,699 (205,399 males and 212,300 females) The recuperative power of the Province is, however, well-known and the birth-rate after an epidemic or famine soon recovers its former level, while the death-rate keeps low This has been ascribed sometimes to the weeding out of the weak elements of society, as evidenced by the fact that in 1919 the death-rate fell to 28 3 *per mille* and in 1922 to 22 *per mille*, which is the lowest on record since 1877 As regards the birth-rate, it had dropped to 39 6 *per mille* during 1918, the year of the influenza, but rose to 40 3 in the following year and to 42 9 in 1920 as against 43 8, the average of the decade.

During the last decade the birth rate maintained a high level while the death rate was particularly low during most of the years. The natural increase i.e. the excess of births over deaths, though considerable, does not account for the total rise in population, and the amount of migration has further to be taken into account and undoubtedly has a considerable effect on the population figures The exodus from the Province is much greater than the influx. The statistics obtained at this census show that 705 603 Punjab-born persons were enumerated outside the Province while 674 152 persons enumerated within the Province had been born outside its limits. This excess of emigration over immigration has also to be reckoned with.

It has also to be borne in mind that the record of births and deaths cannot be entirely depended upon, and errors apart from omissions which must be considerable especially in the case of births, are also accompanied by errors that creep in during compilation under a system which does not enjoy the benefit of centralisation

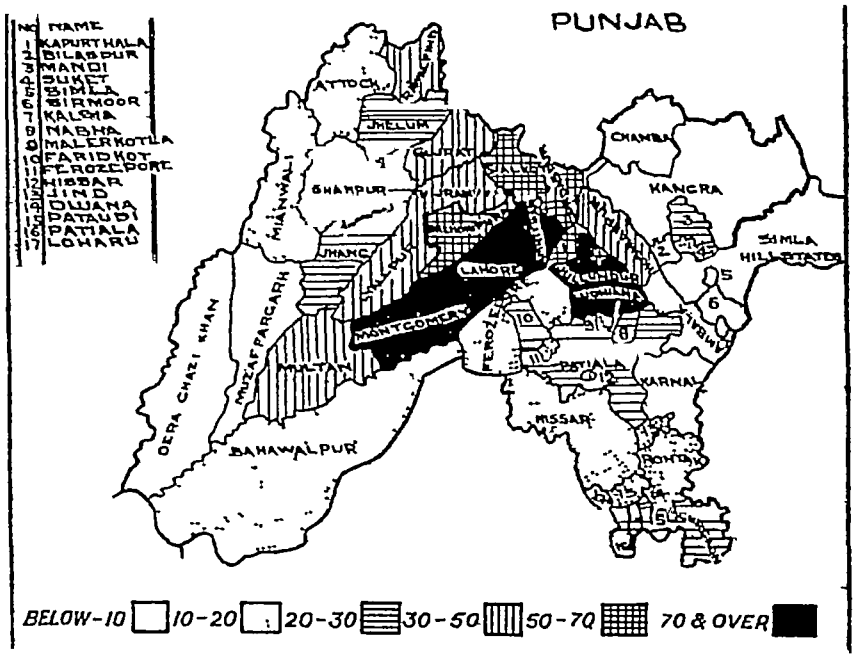

Before entering upon further discussion about the rate of increase in the population and ascertaining how far it is due to natural causes it will be well here to indicate by means of a map the varying rates of increase in different parts of the Province. In colony areas, where there is a considerable amount of immigration, and where the economic prosperity and sanitary conditions secure for the populace a large excess of births over deaths, the rate of increase is not at all a *matter for surprise*. The map in the margin shows at a glance the percentages of increase for the various districts and states. A comparison with the density map at page 13 will show that the areas with the largest percentage of increase are not necessarily those with the maximum density and this is far from being the case except in one or two districts. It is however obvious that the population is gravitating towards the south west where the canal colonies are situated In this tract the population is growing apace and the rise in the Montgomery District is as large as 45 8 per cent in Multan 22 1 per cent and in Bahawalpur State 26 per cent Of course the main cause is the influx of cultivators into these areas as a result of colonization.

Increase per cent of the population per square mile (1911—31).

There is a danger however of over-estimating the rise in population if expressed in the form of percentages as certain district which were sparsely populated show a high percentage of increase without the population having approached the density of thickly populated non-colony districts. Mianwali is

a case in point and although it is the 23rd district in the order of absolute increase, it has the ninth highest percentage of rise A more suitable way to estimate the rise in population of a locality is to examine the rise in the number of persons per square mile, for this correlates the rise in the number of persons with the extent of the area on which they are spread The map in the margin shows the increase in the number of persons per square mile in each district and state during the last decade It will be seen that Montgomery is among the few districts, which claim an increase of over 70 persons per square mile and it has also the highest percentage increase On the other hand Lahore, Amritsar, Jullundur and Ludhiana, while showing a large increase in the number of persons per square mile, do not exhibit such a large percentage of increase for the obvious reason that they were already congested In Lyallpur, Sialkot and Gurdaspur the population has risen considerably both in respect of the total increase and increase per square mile In Multan and Bahawalpur the increase per square mile is still very much less than in the districts mentioned above Before Bahawalpur becomes densely populated like the neighbouring District of Multan, it will absorb nearly 200,000 more persons, and in view of its agricultural development, such a contingency does not appear to be very remote

Increase in the number of persons per square mile (1921—31)

46 In the ordinary course of events the population may vary at each census owing (1) to a difference in the standard of accuracy attained at different censuses, (2) to variation in area, (3) to excess of births over deaths or *vice versa* and (4) to migration For the sake of convenience the last three causes will be dealt with first To illustrate the variation in population resulting from changes in area, it may be stated that the population of the Punjab in 1901 was smaller than in 1891 because during the intervening period a considerable portion had been taken away from it to constitute the North-West Frontier Province As a matter of fact in the areas, which continued to form the Province, the population showed an increase as observed in Section 4 above When we refer to the population of the Province or any of its parts at a past census, we mean the population that resided in the area as constituted at present In this way alone a comparison is possible, and it is after the necessary adjustments that variations at each census are given in Imperial Table II for the Province as well as for all districts and states *

The Causes of the Variation in the Population

*The revised total population of Lyallpur and Sheikhupura for 1921 comes to 1 009,570 persons (562,320 males, 447,250 females) and 582,895 (326,404 males, 256,491 females), respectively, and not as shown in Imperial Table II

The external changes of boundaries during the last decade which affect the population of the Province have been described in Section I and the increase in population due to them is only 454 for the 1921 Census, which is negligible. All the same the figures of 1921 and of previous censuses in Table II have been adjusted.

Natural Increase, Births and Deaths.

47 We can now take up the subject of natural increase in the population. There have been 8 700 082 births and 6,260 408 deaths during the last decade in British Territory where a uniform system of registration obtains.* The above figures do not include those for the Biloch Trans-frontier tract of Dera Ghazi Khan District, for which vital statistics are not available.

Ignoring the effect of migration for a moment and adding the births to and subtracting the deaths from, the population enumerated at the Census of 1921 we would obtain the population of the Province, as warranted by natural increase. This simple expedient applied to the figures for British Territory gives result as shown in the margin. This indicates that the actual population is greater than the estimated population.

Census population of 1921	20,858,720
Add excess of births over 1921—30 deaths during the decade 1911—20	2,439,674
Calculated population 1921	23,298,394
Census population 1921	23,841,210
Excess in census population 1921	442,816

An attempt may now be made to calculate the population after taking into account the element of migration during the last decade. The vital statistics do not include the particulars of persons, who were born in the Punjab but left it during the decade or those who were born elsewhere and came to reside therein. As no information is available as to the number of such persons the only alternative is to make an estimate from the material at our disposal. That material consists of the number of persons enumerated in the Punjab with a foreign birth place (immigrants) the number of the Punjab-born enumerated in other provinces and some foreign countries (emigrants), and the total number of births and deaths recorded during the last ten years. In making an estimate of migration we will have to assume that the waves of migration are constant from year to year and that those who migrate do not return. The proportion of the population, which migrates to and from the Province is so small, being only between 3 and 5 per cent. respectively of the total population that it should not affect the results to any appreciable extent even if the calculations err slightly on one side or the other.

The number of the present migrants is known to us, and we can obtain from the last Census Report the number of persons born in the Punjab and enumerated outside in 1921 while the same Report will also give us the number of persons born outside and enumerated in the Province in 1921. These we may call the emigrants and immigrants of 1921. The figures of emigrants of 1931 as communicated by the Census Commissioner and immigrants in our own record, contain some of the persons, who had migrated prior to 1911 and were still alive. If we could find out their number we would be in a position to ascertain the number of persons who migrated during the last decade. The only means to ascertain the former figure is the application of a suitable death rate to the total number of migrants of 1921. While determining the death rate we have to bear in mind the fact that the persons who leave the Province of their birth are generally in the prime of their lives and as a rule come from the more energetic and healthy section of society. They include a comparatively small

* 11,396 births and 20,104 deaths registered in cantonments situated in British Territory have been added to figures supplied by the Public Health Department for the protected Punjab.

number of children and aged people, and consequently the death-rate among them is considerably smaller than in the total population The mean death-rate of the Punjab for the last decade was 28 6 *per mille*, and assuming that the emigrants do not go to localities more unhealthy than their own, and in this assumption we are on firm ground since most of the emigrants were enumerated in the neighbouring provinces or states a death-rate of 20 *per mille* will be quite appropriate to adopt If this death-rate is applied we find that $\frac{1}{50}$th of the persons, who had migrated prior to 1921, died every year so that at the time of the present census $\frac{1}{5}$th of them in all would be dead and the number of present survivors will thus be $\frac{4}{5}$th of the total strength of the emigrants in 1921

Having ascertained the number of survivors among persons, who went from or came into the Province prior to 1921, we can work out similar figures for the last decade It will not, however, suffice merely to subtract the survivors from the total emigrants or the immigrants recorded at this census, because some of the immigrants or emigrants of the decade too must have died during the decade Applying the same death-rate and still keeping to the assumption of the constant waves we find that of 1,000 emigrants leaving the Province during the first year of the decade ten will have died at the end of the year, and 20 will die in each of the next nine years, leaving 810 of them surviving in 1931 Similarly, of the 1,000, who went out in the second year of the decade 830 will have been left and so on in the ascending scale till we find that of 10,000 emigrants going out of the Province in each of the ten years, 9,000 will be surviving at the time of the census The same method may be used in respect of the immigrants Now if we subtract the survivors of the immigrants of the period prior to 1921 from all the emigrants of 1931 we will obtain $\frac{9}{10}$th of the emigrants of the last decade The result can be shown in the form of the following equation —

$$E_{31} - \tfrac{4}{5}E_{21} = \tfrac{9}{10}E$$

or

$$9E = 10E_{31} - 8E_{21}$$

Where E_{31} represents emigrants of 1931, E_{21} emigrants according to the 1921 Census and E the emigrants of the decade, 1921—31

Similarly, if I (denoting immigrants) is substituted for E in the above equation, we can obtain the number of immigrants coming into the Province during the last decade

We know that $E_{31} = 1{,}065{,}897$ and $E_{21} = 903{,}348$

$I_{31} = 895{,}547$ and $I_{21} = 856{,}951$

By substituting these values in the above formula we get E=381,354, and I=233,318 Therefore I—E=148,036, or in other words the excess of emigration over immigration in the Punjab during the last decade amounts to 148,036 Sub-

Calculated population (1931) by vital statistics	23,098 394
Deduct excess of emigrants over immigrants during the decade	148 036
Estimated population	22,950,358
Census population of 1931 excluding Biloch Trans frontier Tract	23,551,210
Excess of census population over estimated population	600 852

tracting this from the figures obtained in the elementary table above we get the result as shown in the margin The last line in the table indicates that there is an excess of about 600,000 in the enumerated over the calculated population of British Territory in 1931 We may now proceed to explain this excess

The enumerated population of 1921 was in defect of the calculated population of that year If re-calculated with the help of the vital statistics and the figures of migration since 1911 by the same method as has been used above

Census population of 1911 (excluding Baloch Trans-frontier Tract)	18,830,479
Add excess of births over deaths (1911—20)	1,409,348
	20,239,827
Deduct excess of emigrants over immigrants during (1911—20)	141,463
Calculated population 1921	20,098,364
Census population 1921	20,464,720
Defect in census population 1921	146,454

the population of 1921 appears to have been under-enumerated by about 160 000 as indicated in the margin. Subtracting this figure we find that there is an excess of 441,928 in the enumerated population of British Territory over the calculated population. Some of the remaining portion of this excess is accounted for by the over statement of the population which can be tested by other internal evidence afforded by the statistics An attempt will be made at the end of the next section to summarize the causes of inaccuracy in the figures of the total population on this account Further allowance has to be made about the return home of demobilized soldiers and rehabilitation of certain emigrants. Some portion of this excess perhaps results from a more complete enumeration of backward areas. It will be reasonable to assume that these factors account for half of the excess the remainder works out at 94 per cent. of the total population.

Age Distribution.

48 We may now attempt to study how the increase in population has altered the age distribution of the Province or the proportions of the sexes. We shall also notice in the next paragraph what influence the different religions have on the growth of the population.

The effect of the movement of the population on age distribution can be examined by means of the marginal table. Certain quinquennial age-groups have been amalgamated to eliminate as far as possible the effect of different methods of tabulation adopted at this and the last census, and to show the results in a form easily comprehensible. The groups appearing in this table coincide with well known divisions of human life, viz., childhood youth and middle and old ages. The figures are given for the Province as well as for Natural Divisions. The most striking fact is an all round decline in the number of persons aged 60 and over This is, however entirely due to the figures of the present census having been compiled by methods different to those of 1921 This subject is further discussed in Chapter IV where the cause of this deficiency is fully explained The next age period which attracts attention is that of ages 15 to 40 and in this there is generally a large increase over the figures of 1921 This is due to the corresponding age period at last census having been adversely affected by the influenza epidemic The effect of that epidemic is also noticeable in the age period 40 to 60 which shows a comparatively small increase the persons now between these ages being the survivors of the affected population.

Percentage of variation in Age-distribution (1921—31)

Province and Natural Divisions	All ages	0—10	10—15	15—40	40—60	60 and over
Punjab Province	+13·5	+14·9	+17·1	+29·6	+2·6	−11·2
1. Indo-Gangetic Plain West	+11·4	+12·6	+17·6	+19·1	+3·1	−13·1
2. Himala an	+8·4	+9·9	+8·1	+9·3	−0·2	−9·4
3. Sub-Himalayan	+11·9	+13·7	+13·4	+17·9	+1·7	−15·7
4. North-West Dry Area	+1·8	+1·3	+22·2	+29·9	+7·6	−12·3

The effect of immigration into the North West Dry Area is reflected in the larger percentage of increase in the population aged between 15 and 40 which is usually the most active period of life The same reason accounts for the proportionately higher increase in ages 40—60 in this area. The growth in the population under 10 and from 10 to 15 is comparatively high in all Natural Division and indicates the "renewal" of the population.

Sex Proportion.

49 The movement of the population has but slightly altered the sex proportion of the Province or its Natural Divisions as indicated by the table below, which also gives the figures for certain other provinces

Number of females per 1,000 males (Actual Population)

Locality	1931	1921	Locality	1931
Punjab Province	831	828	North West Frontier Province	843
British Territory	831	830	Delhi	722
Punjab States	832	820	United Provinces	906
Indo Gangetic Plain West	813	805	Bihar and Orissa	1,008
Himalayan	906	907	Bengal	924
Sub-Himalayan	847	852	Burma	958
North West Dry Area	831	827	Central Provinces	9,996
Urban	705	719	Madras	1,025
Rural	850	841		

The proportion of females has on the whole increased slightly, but is still one of the lowest in India The conditions in each Natural Division remain much the same as in 1921 A slight decrease is noticeable in the case of the Sub-Himalayan and Himalayan Divisions In the case of the former the decrease is to a considerable extent due to the return of disbanded soldiers to the Districts of Jhelum, Attock, Sialkot and Gujrat The insignificant decrease in the Himalayan Division is due to the decrease in Kangra for the same reason

There has been an increase in the number of females in rural areas and corresponding decrease in urban areas, which shows that more males than females have moved to the towns from rural areas

Influence of Religion on the Movement of the Population

50 In order to ascertain the influence of religion on the movement of the population we will examine the distribution of the population according to religion at different periods An examination on these lines indicates that every 10,000 of the population at each census was distributed as in the margin These figures indicate that the proportion of Sikhs, Christians and Muslims to the total population has been on the increase during the last fifty years In other words these communities have increased at a higher rate than Hindus Such an examination of the figures, however, does not indicate the actual pace at which the population of each religion has varied or the extent to which it has affected the total population The percentage of actual variation is shown in the marginal table for different religions for the past six censuses It is evident that Hindus have decreased while the other communities have increased The increase among Christians and Sikhs, as we shall see later on, is not due to natural causes alone, but is also due to a considerable extent to conversion The rise among Muslims, which would seem entirely to be due to natural increase, is considerably higher than the rise in the total population which would not be so great if the Muslims did not form the pro-

Year	Hindu	Sikh	Muslim.	Christian
1881	4,381	824	4,758	14
1891	4,358	822	4,778	21
1901	4 127	863	4,991	27
1911	3,570	1,211	5,107	82
1921	3,506	1,238	5,105	133
1931	3,018	1,420	5,240	148

Religion	1881 to 1891	1891 to 1901	1901 to 1911	1911 to 1921	1921 to 1931	1881 to 1931
Hindus	9 8	7	−15 3	3 4	2 3	−5 8
Sikhs	10 2	11 6	37 0	7 8	31 0	138 1
Muslims	10 9	10 4	0 5	5 5	16 5	51 2
Christians	70 5	35 5	201 3	70 5	26 0	1394 8
Total	*+10 2*	*+6 3*	*−2 4*	*+5 5*	*+13 5*	*+37 0*

portion of the total population that they do. The very high *percentage of* rise among Sikhs and Christians does not affect the total population to any appreciable extent.

1921—31.	Hindus.	Muslims.	Indian Christians.
Births (thousands)	3098	4874	133
Average birth-rate	40·85	42·88	44·10
Average death-rate	30·23	30·43	27·88
Survival rate	10·63	12·45	16·22

The above remarks are borne out by the table in the margin which show the number *of births in* each community and the average birth death and survival rates for the last decade

The term Hindus includes Sikhs Jains and Buddhists for whom separate figures are not available. In the case of Christians the figures for Indian Christians alone are shown for the purpose of comparison It is evident from this table that the survival rate is highest among Indian Christians and fairly high among Muslims, who have higher birth and death rates than the Hindus.

SECTION 7—MOVEMENT IN SMALLER UNITS

Movement in Natural Divisions.

51 In the last section certain maps were inserted to show the distri*bution and movement of population. From a closer study of these an idea* of the density by districts and the rate of increase in different areas can be formed In this section we shall endeavour to examine the increase in the smaller units and find out its cause and effect and thus come to some conclusion as to the possible trend of future growth.

We shall begin by examining the growth in each Natural Division and then work down to individual districts and States. The table in the margin shows the absolute and percentage increase during the last decade as well as the percentage increase during the previous decade in each Natural Division. The percentage increase for the last decade is largest in the North West Dry Area, being 21 5 per cent. It is close upon 12 per cent. in the Sub-Himalayan slightly less in the Indo-Gangetic Plain, and only 5 4 per cent. in the Himalayan. The absolute increase, however is greatest in the Indo-Gangetic Plain though the North West Dry Area is not far behind in this respect. The Sub-Himalayan comes next and the Himalayan last of all The large increase in the population of North West Dry Area is respon ble to a large extent for the remarkable rise in the total population of the Province This area which is still far from being fully developed claimed the highest percentage of increase even during the previous decade when the population of the Himalayan and Sub-Himalayan Divisions was almost stationary

Natural Division.	Absolute increase	Increase per cent. in population.

29	Simla	—9		1

52 The table in the margin compares the actual variation in population for each district with the fluctuation in cultivated area and the excess of births over deaths The districts are shown in the order of increase in total population In the Districts of Montgomery, Multan and Mianwali cultivated area has increased by more than two lakhs of acres in each case, accompanied by a big natural increase The former feature indicates undoubtedly the large influx of cultivators into the two first-named districts In Mianwali the indigenous population has multiplied at a rate unknown since 1881, obviously owing to the large increase† in cultivated area The percentage of matured area in this district is now much larger than it was during the previous decade

*For the purpose of this column the figures of 1921 22 and 1930 31 have been taken

In districts such as Shahpur, Lyallpur, Sheikhupura, Jhang and Ferozepore, cultivated area has risen substantially though not at all to the same extent as in the three districts, mentioned above, and in these also there has been a large natural increase which in the case of Lyallpur, Jhang and Ferozepore is even higher than the total increase

In certain other districts there has been a large natural increase, unaccompanied by a corresponding rise in cultivated area The total rise in population in these districts, however, is smaller than the natural increase, indicating that there has been actually some emigration from them Such districts are Jullundur, Gurdaspur, Hoshiarpur, Rohtak, Hissar, Gurgaon, Dera Ghazi Khan and Muzaffargarh, which comprise some of the best and some of the poorest districts of the Province It can safely be said that in these districts the population has reached a stage where its pressure is being felt on the resources Of course, the rate of the natural increase in population varies considerably in various districts, and presumably fluctuates with the ability of the inhabitants to improve the means of subsistence The true extent of migration from these districts is not equivalent to the difference between the actual and the natural increase, but the figures point to the existence of this important movement in no uncertain manner

As regards the remaining Districts, namely Lahore, Amritsar, Gujranwala, Ludhiana, Sialkot, Gujrat, Attock, Rawalpindi, Jhelum, Ambala, Kangra and Karnal, the actual rise in population is not fully accounted for, either by natural increase as indicated by vital statistics or by the increase in cultivated area

† It is problematic as to whether increase in resources results in larger population or rise in population results in increased resources In this Province the former seems to be the general rule

Some of these districts have a large urban population which is not solely dependent upon land and it will, therefore, be better to examine the growth of the rural population. Some of the relevant figures are quoted in the margin for the districts which possess a large urban population, and for Gujrat which lies close to them. This analysis clearly explains the rise in the rural population of districts like Lahore Amritsar Sialkot and Ludhiana where there is a larger natural increase than the absolute increase recorded at the census. The conditions in these districts thus resemble those obtaining in Jullundur Gurdaspur and other districts in the third group dealt with above, and there is a considerable emigration from them. The conditions in the villages of Sialkot District, in point of emigration, are even more advanced as there is an actual decrease in the rural population, and the whole of the large natural increase has proved inadequate to counteract it. Numerous cultivators of this district, whose lands were damaged by water logging have been allotted colony land in the Montgomery District, and in some cases whole villages have been transplanted to the Nili Bar Colony There has also been emigration from the district to Bahawalpur State and even to such distant places as Rampur Gwalior Bikaner and Sind.

District.	Rural Population		Increase or decrease per cent in		Emigrants to rural colonies during the decade
	Absolute (1921—31)	Natural increase (1911—21)	Average yearly matured area.	Average yearly irrigated area.	
1. Lahore	66,621	98,777	+7	+11	22,279
2. Amritsar	76,849	109,104	+10	+20	32,863
3. Sialkot	—8,918	75,772	—9	+—	84,047
†† Gujranwala	7...479	83,253	+4	+7	—901
5. Gujrat	87,129	5...968	+27	+22	21,266
6. Ludhiana	66,803	73,763	+10	+31	11,141

The rise in the rural population of Gujranwala may be partly due to the increase in irrigated area. The increase in Gujrat is undoubtedly due to a large extent to the extension of canal irrigation, particularly in the uplands of Phalia Tahsil, as indicated by the marginal table.

Tahsil	Population in 1931	Perc. age of rise
Gujrat	218,378	7·0
Kharian	273,917	10·3
Phalia	230,119	18·9

The figures for the rural population of the remaining districts, which lie in the east north and north-west are given in the margin. The absolute increase in Karnal District is the lowest while the figure of natural increase is also insignificant mainly owing to its bad climate. In the other four Districts, Kangra Jhelum, Rawalpindi and Attock, rural population has risen considerably more than the natural increase would warrant. These four districts are foremost in the Province in providing recruits for the Army and evidently the large number of men demobilised during the last decade is to a great extent responsible for the difference in the natural and the actual increase. It is also probable that the vastness and hilly nature of these districts and the dearth of suitable roads render their vital statistics comparatively less reliable

District.	Increase in rural population		Migration to colonies.	Percentage of area under

Lack of Migration Figures

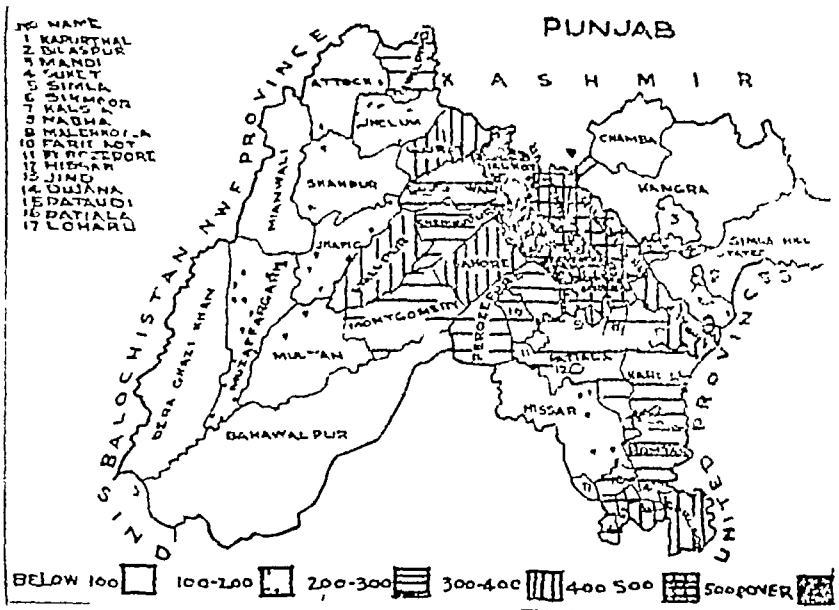

Reference has been made in the table in the last paragraph to the amount of emigration to colonies in the case of certain districts A study of the effect of the total inter-district migration is not possible, as figures of birth-place by districts were not sorted on the present occasion except in the case of colony districts Most of the inter-district migration except to towns is, however, of the casual type and more or less balanced by equal movements in opposite directions

As regards the growth of the population in towns, it is obvious that the causes for the growth are not so apparent in their case as in rural areas In the case of towns in most cases the natural increase is only a fraction of the rise in actual population the main factor being immigration from rural areas, other towns or even from places outside the Province The subject of the increase in urban areas will be examined at length in the next Chapter Here it will suffice to say that the urban population which is only about one-seventh of the rural, has increased at a comparatively much faster rate

Pressure on Resources

53 The subject of pressure on resources is a rather complicated one, and in the census report of a province, which is predominantly agricultural, all that we can do is to study the pressure of population on agricultural resources, with main reference to the density of rural population and its incidence on sown and matured areas Reference has already been made in the last paragraph to the pressure on the resources of certain districts, from which there is a steady stream of emigration to the canal colonies This migration tends to equalize the pressure on the resources in different parts of the Province, but there are certain impediments to perfect equalization, for example the great attachment of human beings to the surroundings in which they have been brought up We can on the whole make general remarks about the conditions in each area as found at the time of the census to indicate where there is room for further expansion

The conditions in each district vary considerably, and the rural population though mainly supported by agriculture is also helped by the presence of other natural advantages, such as extensive pasturage and income from the sale of milk, *ghi* and wool The Punjab peasant or the village menial has not yet taken, to any appreciable extent, to subsidiary industries such as sericulture, lac-rearing, orchard-growing, bee-farming, etc , for augmenting his income directly or indirectly so that he is almost entirely dependent on agriculture First of all we may examine the density of rural population per square mile of the rural area The map in the margin shows this at a glance The districts

Rural density per square mile by district and state 1931

District.	Density per square mile	District.	Density per square mile
1		1	2

are arranged according to rural density in the table appearing in the margin This table, while showing the districts such as Jullundur Sialkot, Amritsar Gurdaspur Hoshiarpur Ludhiana Gujrat and Lyallpur as having a high density does not really indicate the *extent of the pressure* on resources of certain other districts such as Kangra, Simla, Dera Ghazi Khan, Muzaffargarh and Rawal pindi, which possess extensive areas but very little cultivation. No doubt, the pressure of the rural population on resources can be better studied if we know the total annual value of agricultural produce for each district. This information, however is not readily available and an attempt to obtain it would be an exceedingly laborious task, involving the calculation of (*a*) the annual matured area under each crop grown in the district, (*b*) the normal yield per acre of each crop and (*c*) the commutation price per maund of each crop Further we will have to make these calculations in respect of several years, and then to strike an average in order to know the value of the total produce of a district during an average or representative year of the last decade Obviously an attempt at these elaborate and extensive calculations is not worth the trouble for our purpose. We have, therefore, to be content with the examination of the incidence of rural population on a square mile of sown and matured areas. It may be necessary to mention that the extent of sown area varies from year to year *being mainly governed by rainfall. In a dry year it contracts, while in a year of* copious rainfall it extends considerably So the suitable method is to take the average of the decade and this is done in the table below which also gives the incidence of population on average matured area Similar figures of incidence for the previous decade have also been given with a view to show in what districts the incidence has materially altered during the last decade

INCIDENCE OF THE RURAL POPULATION PER SQUARE MILE ON

1 the case of Sheikhupura and Gujranwala the figures of sown and matured areas are not available for the period prior to 1919 20, and an average has been taken on the figures of the two years 1919 20 and 1920 21.

The districts have been arranged in the table according to the incidence on the average sown area of the last decade It is evident that Hoshiarpur, Simla, Kangra, Jullundur Sialkot, Gurdaspur, Rawalpindi, Amritsar and Gujrat are the most densely populated districts inasmuch as they have the largest number of persons per square mile of the sown area The position of most of these is practically the same as at last census According to the incidence on matured area the most congested districts are Kangra, Hoshiarpur and Simla, followed by Sialkot, Jullundur, Rawalpindi, Gurdaspur, Amritsar and Gujrat There are two other districts not in this group, which are 6th and 9th from the standpoint of incidence on the matured area and these are Muzaffargarh and Dera Ghazi Khan In both these districts the percentage of matured area during the last decade has fallen considerably, being 80 and 69 as against 92 and 80 for the previous decade respectively This drop in the matured area can offer some explanation for the small rise in the population of the two districts

It is important to realise that the mere fact that certain districts are at the head of the list does not necessarily mean that there is a severe pressure on their resources As a matter of fact their fertility of soil or other characteristics enable them to support a large population without being subjected to any undue strain on the resources With this note of caution I would resume discussion of the nine districts at the top of the list Hoshiarpur, Simla and Kangra head the list in the order of incidence both on sown and matured areas but they all possess several additional advantages In Hoshiarpur rainfall is copious and unlike other districts valuable crops, such as maize, cotton and even sugarcane can be grown on lands which are solely dependent on rain Many of its inhabitants serve in the Army, earn their livelihood in other districts as skilled labourers and domestic servants, and also go to the colonies across the sea and make much money The men of Kangra are to be found in the Army in considerable numbers, and also go out to other districts for odd jobs In the small rural area of Simla the people have the advantage of selling milk and vegetables during the summer in Simla town, where they have also a field for employment of a varied nature Sialkot has a productive soil, good rainfall and a very diligent peasantry Its marketing facilities have considerably improved as a result of the extension in road and railway communications But as already remarked there has been a large exodus from the district during the last decade, indicating much pressure on the resources Gurdaspur and Amritsar lie in the same fertile tract, and the ample rainfall in the former is made up by a larger irrigation in the latter Jullundur has a very fertile soil, good rainfall, numerous wells, excellent marketing facilities and agriculturists reputed for exceptional diligence Many of its inhabitants serve in the Army and also migrate to Australia and other colonies and at regular intervals send considerable sums of money to their families This district, as also Hoshiarpur, is, however, faced with an acute problem which has an important bearing on its future agricultural prospects The spring level in the greater part of the two districts has been falling steadily during the last decade, and in numerous cases a considerable expense has to be incurred by the owners to keep the wells working by means of boring and further digging, while many wells have dried up altogether The fall in the sub-soil water level appears to be due to the decrease in rainfall and the increase in the number of wells Unless the conditions improve perceptibly, the two districts will have to face an excessive strain on their resources Rawalpindi which was 11th on the list according to the incidence on sown area at last

census is now 7th Numerous men of this district take up military service and thus relieve the pressure on its agricultural resources. The town of Rawalpindi as also Murree during summer months, offers considerable employment to the men of the neighbouring villages. Gujrat was 5th on the list at last census and is now 9th, having benefited considerably by the extension of canal irrigation during the last decade. The western part of the district is canal irrigated, while the eastern, which is outside the limits of canal-irrigation, receives ample rainfall and possesses good soil and industrious cultivators. It was remarked by my predecessor that there was a considerable strain on the resources of this district. As a matter of fact the population of the district has risen by 12 per cent during the last decade, and it seems capable of supporting an even larger population.

We shall now turn to the next group of districts, viz., Muzaffargarh, Jhang Multan, Ambala, Jhelum, Sheikhupura and Montgomery As already remarked Muzaffargarh shows unusual pressure on its resources owing to the low percentage of its matured area during the last decade. Its position according to the incidence on matured area was 11th at last census, and is 6th now Jhang Multan, Ambala and Jhelum are practically where they were at last census. Multan despite the enormous rise in population does not indicate any greater pressure on its resources than at last census, evidently due to the large agricultural development, which has recently taken place In the case of Jhelum the low hills contain much unfertile land, but it has additional resources to support its population. Numerous men of this district are serving in the Army and many retired soldiers have been allotted colony land in the Gujrat District and the Nili Bar Sheikhupura and Montgomery have fewer men to support on a square mile of the sown and matured areas than at last census, although population in both of them has risen very largely particularly in Montgomery which has registered the largest increase in the whole of the Punjab The reason for this is not far to seek both the districts, particularly Montgomery have greatly developed their resources during the last ten years as a result of the canal irrigation The obvious conclusion is that though these districts have claimed an unusual rise in population they are still capable of supporting a larger number of people at the standard of living that the people of congested districts are accustomed to.

The next group of districts comprises Ludhiana, Gujranwala Dera Ghazi Khan Lahore Lyallpur and Karnal. As already remarked the pressure on the resources of Dera Ghazi Khan seems to be very great. Ludhiana and Gujranwala despite a large rise in population have practically maintained their position on the list. In the latter district many thousand acres of cultivated land have been damaged by water-logging but irrigated area has increased during the last decade, as also the percentage of maturity Thus the pressure on resources is in no way greater than it was at last census. Lahore and Lyallpur are exactly where they were on the list at last census, and in the case of the latter the indication in spite of the considerable rise in population is that it is still capable of supporting a larger number of people. Karnal was 15th on the list at last census and is now seven places lower down, evidently because its population has risen by no more than 2 per cent., which by itself is an indication of the great pressure on its resources.

The remaining seven districts are Gurgaon, Rohtak, Attock Shahpur Ferozepore Mianwali and Hissar Their position at the bottom of the list does

not really indicate prosperity or any abundance of resources The first-named district according to the incidence on matured area should be eleven places higher up, and it is significant that the percentage of maturity has considerably fallen during the last decade, and is only 67 Thus the pressure on its resources is undoubtedly very great The rise in population in the Rohtak District is less than 5 per cent, which is symbolic of the large pressure on its resources But for the small rise in its population its position on the list should be considerably higher than it is Attock remains on the list practically where it was ten years ago It has a considerable area near the Indus, which is one of the best *chahi* (well-irrigated) tracts in the Province, but for the most part the district has to depend for its cultivation on rainfall Like Jhelum it has numerous men in the Army and many retired soldiers have been allotted colony land Moreover, its inhabitants are well-known for their enterprise, and many go out to trade in distant places and even across the sea and become prosperous On the high seas men of this district are to be found serving as *lascars* on steamers But for these additional advantages the district would have a great strain on its resources The position of Shahpur is unchanged It has the benefit of canal irrigation in three tahsils, while the fourth (Khushab) is purely dependent on rainfall for its crops, but has numerous men serving in the Army This district is, therefore, not faced with any great pressure on its resources Ferozepore has benefitted by canal-irrigation from the Sutlej Valley Project during the last decade, and is easily capable of supporting its population, though the emigration to canal colonies is an indication of the increasing pressure The bulk of the cultivated area in Mianwali is *barani* (dependent on rainfall), but the construction of Nammal Dam during the previous decade has provided irrigation to thousands of acres of arid land The cultivated area has enormously increased during the last decade, and the district is now regarded as one of the greatest producers of gram This increase in cultivated area seems to have been mainly responsible for the rise in population Hissar is at the bottom of the list as at last census The greater part of the district is sandy and unirrigated Its agricultural resources are therefore, much restricted, but they do not seem to be subject to any undue pressure of population

From what has been said above it can be safely inferred that Muzaffargarh and Dera Ghazi Khan in the south-west and Rohtak, Karnal and Gurgaon in the south-east are subject to a great pressure on their resources, and any considerable rise in their population on future occasions is not to be anticipated The same applies to Sialkot The Hoshiarpur and Jullundur Districts, which have an unusually large density of population and which have in the past been able to support it by means of their agricultural and other resources, are faced with a grave situation owing to the receding spring level and diminished rainfall These districts have sent a very large number of cultivators to the various canal colonies during the past few decades, and while emigration is likely to be resorted to as a means of relieving the increasing pressure, the growth of the population on future occasions will be comparatively restricted The colony districts, particularly Montgomery, Multan, Sheikhupura and Lyallpur, are likely to maintain their large increase at the next census

Movement in Punjab States.

54 The rate of growth of the population in Punjab States during the last decade may now be examined Vital statistics and the figures of cultivated, sown and matured areas are not available for all the Punjab States, and in their

Natural Division.	Percentage increase 10-1—31.	Absolute increase	Percentage increase 10-1—31.
Indo-Gangetic Plain	11·4	221,335	8·3
Himalayan	5·4	66,746	7·2
Sub-Himalayan	11·9	2,477	4·3
North-West Dry Area	1·5	203,421	20·6

case a discussion like the one for British Territory is not possible The figures in the margin give the increase per cent. in the population of the states according to the Natural Divisions in which they are situated and also compare their percentage rise to the total rise in the Divisions. It will be seen that the rise in both cases is greatest in the North West Dry Area, which comprises only one state, viz. Bahawalpur This state has recently become extensively colonized and the increase is mainly due to immigration. The next highest percentage of increase is to be found in the case of the states situated in the Indo-Gangetic Plain West. In this Division are situated the majority of the Punjab States, namely Pataudi, Dujana, Loharu, Jind, Patiala, Nabha, Maler Kotla, Kapurthala and Faridkot. The rise in all of these when grouped together is lower than in the whole of this Natural Division, and the cause is apparent enough. These states on the eastern side adjoin the Districts of Rohtak and Karnal where the rise in population has been very low and on the north the State of Patiala runs actually into the Himalayan Natural Division with its slow rate of increase and one of its three districts at the extreme south-east of the Province borders on the Bikaner State. On the west these states touch the desert Districts of Ferozepore and Hissar and on their north are the prosperous Districts of Ambala, Ludhiana and Jullundur The conditions obtaining in these districts are more or less reflected in the states situated in the same neighbourhood. On the whole therefore, the rise in all the states is quite in accord with their location

The rise in the population of the states in the Himalayan Division is 7·2 per cent. or higher than in that Division taken as a whole. The main increase has taken place during the last decade in the Mandi State, being partly due to the migration of persons employed on the construction of the Hydro-Electric project at Jogindarnagar and its neighbourhood.

In the Sub-Himalayan Division lies the bulk of the solitary State of Kalsia The soil is generally poor and irrigation negligible, and the small rise is therefore not surprising.

No. in Serial	State	Increase in population (absolute figures).	Percentage (actual increase).	Natural increase (absolute figures).
	Indo-Gangetic Plain West	**221,335**	**8·3**	
1	Loharu	7,717	17·2	
2.	Dujana	3,243	9·3	
3.	Pataudi	778	4·2	
4	Kapurthala	32,482	17·4	
5.	Mal Kotla	2,750	3·4	
6.	Faridkot	12,393	9·1	11,477
7	Patiala	123,791	8	87,963
8.	Jind	18,493	5·4	43,764
9	Nabha	21,488	9	4 493
	Himalayan	**66,746**	**7·2**

12.	Bilaspur	2,974	7·1	
13	Mandi	22,417	12·1	11,537
14	Suket	4,840	7·5	1,731
15.	Chamba	31,061	7·3	113 (of Chamba Tea only).
	Sub-Himalayan	**2,477**	**4·3**	
16.	Kalsia	2,477	4·3	
	North-West Dry Area.	**203,421**	**20·6**	
17.	Bahawalpur	203,421	20·6	

The table in the margin shows the absolute increase as well as the increase per cent in the population of all the states separately together with the figures of the natural increase wherever available It will be seen that the vital record is far from being complete except in very few cases

The material to compare the movement of the population in the various states

with that in the neighbouring British Territory is readily available in the maps on pages 64 and 65 From these it would appear that the increase is in keeping with what might have been expected

Accuracy of Census Figures

55 After having examined the movement in the population of each and every unit of the Province we may take up the question of accuracy of the figures In a country, where baseless rumours can cause a mutiny, or a small incident be so distorted as to lead to most serious riots, it is only natural that an operation like the census should come in for its share of criticism and suspicion While in the past all sorts of motives were imputed to Government for taking a census, the populace is no longer in doubt as to its objects and appreciates its far-reaching consequences All the same misapprehensions were not entirely absent For example, a harmless instruction about the choice of certain distinctive colour for slips, on which entries of certain sects were to be copied to save a little labour in abstraction, was construed into an attempt to perpetuate a sectarian division among the members of the most intellectual communities in the Province

Under the circumstances it is not surprising that while some people complained of omissions in enumeration, some asserted a swelling of the figures of communities other than their own by means of bogus entries It has to be remembered that in the course of an operation of such magnitude as the census, some omissions are bound to occur But, as remarked by most of the District officers in their reports, there was a general tendency on the part of the various communities to have each and every member of theirs enumerated This is corroborated by the fact that the census population during the last decade has shown an increase unequalled in the past There cannot, therefore, have been many omissions

Coming to the question of artificial swelling of the figures, we find as already explained in paragraphs 51 and 52 that the rural population has increased in all areas as was to be expected from the development of the resources in each district In this Province as perhaps elsewhere too, the pace of increase depends on the development of material resources For example, with the improvement in agricultural conditions in an area its population goes up No attempt is made by the people to keep down their number or to raise their standard of living to a level obtaining in the western countries It is however, undeniable that of late the standard of living has been rising though it has recently been overshadowed by the prevailing economic depression For instance, an average person, whether in towns or rural areas, now enjoys many more luxuries and amenities of life than his forefathers did In most of the districts, particularly in colony areas, he is better fed, better clothed and better housed Earthen utensils have made room for utensils of brass and other metals, and even glass and china are no longer a rarity A motor vehicle, which was an object of wonder not many years ago, is now the commonest means of conveyance in all parts of the country All the same the fact remains that the standard of living is still susceptible of much improvement and great leeway must be made before the standard of western countries is reached In these circumstances the phenomenal rise in population cannot be regarded as an unmixed blessing Be that as it may, the rise in the population of rural areas is due to natural increase and migration, and not to any errors in enumeration worth the name

The rise of population in urban areas, which will be discussed fully in the next Chapter, is to a large extent the inevitable result of the increased pros-

penty commented upon in Section 5 of this Chapter While in rural areas the work of preliminary enumeration was done by the *patwaris* who under the supervision of their superior officers almost invariably discharged their duties faithfully in most of the towns this work was entrusted to the enumerators, who belonged to numerous categories, such as clerks, *teachers, students, municipal* employees, businessmen, etc It is, therefore not surprising that the enumeration work in towns was not characterised by the same amount of carefulness and accuracy as in villages Another factor came into play on the present occasion and deprived the census operations of the calm atmosphere, which is essential to the obtaining of correct returns. The people had realised that *their political* rights depended upon the census figures. The new constitution for India was to be framed at no distant date, and the value attached to the communal figures brought out by the census was greater than ever Consequently the atmosphere was surcharged with propaganda carried on through various agencies, and attempts were made in some places by the enumerators to swell the figures of their community by means of bogus entries, or to curtail the strength of a rival community by scoring out persons who were actually present in their houses on the final census night. There were also some cases, in which the residents of houses returned bogus names with the same motive. This mostly took place in certain urban areas, the worst *offender in this respect being* the city of Amritsar In the Montgomery town the various communities actually summoned their friends from the neighbouring villages on the final census night in order to have them enumerated as residents of the town and thus to secure more seats on the municipality This effort proved valueless, as it made a uniform addition to the numerical strength of the communities and left the previous proportions unchanged. In this particular case the total census figures remained unaffected as the villagers recorded as residents of the town on the final census night were scored out from the enumeration books of the villages It may also be remarked that while bogus entries were made to swell the figures, in some of the large towns the apathy on the part of the enumerators was responsible for certain cases of omission. For example in Lahore several cases came to notice, in which whole families were left unenumerated. The effect of bogus entries made to swell the census figures, was to some extent counter-acted by cases of omission and also by the scoring out of entries, referred to above. Having given the matter my careful consideration I estimate that the process of the artificial swelling of figures has resulted in an error representing not more than 1 per cent of the total population.

SECTION 8.—HOUSES AND FAMILIES

General.

58 *During the last decade there has been no change worth the name in* the type of houses built except that *pucca* houses are springing up in villages particularly in the canal irrigated tracts, which ben fited a good deal during the period f high prices following the Great War In cities and towns, particularly in Lahore buildings of the European l ungalow type are coming into prominence an l are generally l uilt outside the congested areas.

Definition of Census House

57 The definition of a census house has varied considerably In 1891 a house was defined so a to comprise all l uildings possessing a common court yard, and in 1891 no rigid definition was laid down, a house being defined as comprising buildings located within a common enclosure or haveli, a common courtyard excepting *lanes and semi-public spaces in towns as well as outlying*

huts and shelters In 1901 the definition was widened and a house came to be defined as any place which happened to be occupied on the final census night, the selection being left to the discretion of the local census officers In 1911 the definition was made rigid, and has remained unchanged since then In villages a house now means a separate *chulha* or hearth, while in towns it means a building intended for the exclusive residence of one or more commensal families apart from other residents of the street or lane The definition is reproduced below from the Census Code

'In rural areas, House means a structure occupied by one commensal family with its resident dependants, such as widows and servants Such detached structures, as have no hearth but are likely to have one or more persons sleeping therein on the night of the final enumeration should be treated as separate houses, so that no person may escape enumeration'

In towns and cities, "House" means a structure intended for the exclusive residence of one or more commensal families apart from other residents of the street or lane In hotels or serais each separate room or suite of rooms should be treated as a separate house Shops, schools and other institutions, having no hearth, but which may possibly have some one sleeping therein on the night of the final enumeration should be numbered as separate houses In Civil Stations each tenement in a row of servants' quarters will be treated as a separate house

It is evident that while in villages a house represents one commensal family, in towns it may mean in many cases several commensal families

58 The figures in the margin show the average number of persons per 100 houses and houses per square mile recorded at all the censuses since 1881, but in view of the change in the definition since 1911 no real comparison is possible except in the case of the last three censuses The number of houses per square mile varies in each Natural Division, being the smallest in the Himalayan and the largest in the Sub-Himalayan The North-West Dry Area has only a few more houses per square mile than the Himalayan, while the Indo-Gangetic Plain has a few less than the Sub-Himalayan The following table compares the number of houses per square mile at the present census with those in 1921 by Natural Divisions

Number of Persons per House

Year	Number of houses per square mile	Number of persons per 100 houses
1	2	3
1881	25	481
1891	27	609
1901	30	620
1911	40	450
1921	40	460
1931	44	470

	Natural Division	*Average number of houses per square mile*	
		(1931)	(1921)
1	Indo Gangetic Plain West	68	64
2	Himalayan	21	18
3	Sub-Himalayan	76	70
4	North-West Dry Area	25	23

Special instructions were issued on the present occasion requiring that houses which were most unlikely to be inhabited on the final census night should not be numbered, and yet we find that the number of occupied houses was only 73 per cent of the total number of houses as indicated below —

Number of houses recorded during the preliminary enumeration	*8,167,739*
Number of houses found occupied on final census night	*5,943,652*

As compared with the last census the number of occupied houses has increased by 411,347 or by 7 per cent. As against this the population has increased by 14 per cent. which indicates that the provision of new accommodation has not kept pace with the increase in the population.

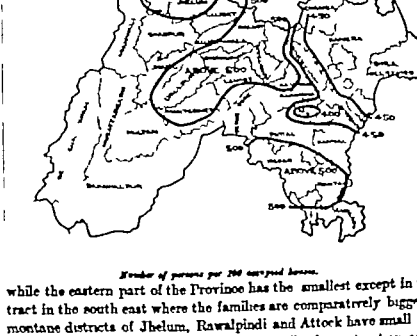

Size of Family

The size of families in 1931 is compared with the corresponding figure for 1921 in Subsidiary Table XI to Chapter II for each tahsil and city in the Province. An extract from this table is reproduced below It will be seen that the size of the family has not altered much, and tracts with large families in 1921 are even now characterised by the same feature.

Districts and States with large families.	Number of persons per 100 houses.	
	1931.	1921.
1	2	3
Lyallpur	572	537
Lahore	557	570
Montgomery	553	489
Amritsar	518	482
Multan	518	449
Shaikhupura	514	504
Jullundur	511	437
Hissar	506	482
Rohtak	498	488
Jind	496	490
Gurdaspur	491	456
Dujana	487	500
Faridkot	486	470

Districts and States with small families.	Number of persons per 100 houses.	
	1931.	1921.
1	2	3
Simla	326	435
Maler Kotla	291	270
Jhelum	403	378
Attock	419	406
Rohtak	4.1	436
Dera Ghazi Khan	422	402
Ambala	434	467
Rawalpindi	437	478
Hoshiarpur	457	478
Kalsia	444	430

The same remark applies to the tract having exceptionally small families. Thus Maler Kotla which had the smallest number of persons per 100 houses at last census, is even now lowest in this respect among the districts and states except Simla District, where the bulk of houses is within the limits of Simla Municipality which were practically deserted at the time of the census, most of them having only a *chaukidar* each.

The map in the margin shows the number of persons per 100 occupied houses; the greatest depression has Maler Kotla as its centre. The central districts have the largest families while the eastern part of the Province has the smallest except in the Hariana tract in the south east where the families are comparatively bigger The submontane districts of Jhelum, Rawalpindi and Attock have small families (less than 4.0 persons per 100 houses) and in the Himalayan tract an average family is slightly larger

The size of the family in this Province is compared below with the corresponding figures of certain other provinces

Province	*Number of persons per 100 houses.*		
	Total	*Rural*	*Urban*
Punjab	*479*	477	493
United Provinces	*477*	482	440
Bengal	*514*	518	467
Bihar and Orissa	*518*	519	482
Bombay	*501*	490	545

The variation in the number of persons in rural and urban families from census to census is of considerable interest The figures for the last three censuses are given in the margin for the British Territory The number of persons per family has increased The figures of urban family showed a considerable decline in 1921 when they dropped even below those of a rural family The only comment that can be offered on this variation is that the definition of 'house' in town or city is in a way arbitrary and rather difficult of uniform interpretation

Number of persons per 100 houses			
	1931	*1921*	*1911*
Rural	479	476	446
Urban	505	444	473

Soon after the final census a special family census was held in typical tracts of the various districts and states The results obtained are discussed in Chapter VI, Civil Condition

SUBSIDIARY TABLE I.

Density Water-supply and Crops.

District or State and Natural Division.	Mean density in 1921.	Percentage of total area.		Percentage to cultivated area of		Percentage of the gross cultivated area to gross cultivated area.	Average rainfall in inches.	Percentage of gross cultivated area under			
	Mean density per square mile in 1921.	Cultivated.	Not Cultivated.	Net Cultivated.	Double cropped.			Wheat.	Rice.	Other cereals and pulses.	Other crops.

NOTE.—Figures in Columns 3 have been calculated from latest survey area. Figures in Columns 3—7 and 9—12 for British Districts have been extracted from tables of Agricultural statistics published by Director of Land Records, Punjab for the year 1920-21 and those for Punjab States from figures supplied for the same year by Census superintendents of those States. Rainfall figures recorded in Column 8 are those recorded the headquarters of districts and states and are averages for the years 1911-12 to 1920-21. The Revenue record of the States are much more complete than heretofore but returns noted below have been compiled from statistics for neighbouring British Districts.

Columns 3—7 and 9—12 for Chamba, *Maler Kotla* and *Faridkot* and Columns 9—12 for *Kalsia, Sirmour, Loharu, Pataudi* and *Kapurthla* and column 8 in the case of *Dujana, Maler Kotla* and *Suket Hill States.*

SUBSIDIARY TABLE IV

Variation in Natural Population.

Particulars.	Punjab.	British Territory	Punjab States.
1	2	3	4
Population on 1st March 1911 — Actual Population	24,490,857	23,580,653	4,910,006
Immigrants	671,154	603,847	317,805
Emigrants	763,603	1,063,997	382,445
Natural Population	24,582,310	23,751,502	4,974,646
Population on 1st March 1921 — Actual Population	25,101,814	24,043,478	4,414,036
Immigrants	627 137	456,051	311,643
Emigrants	512,396	903,343	37,651

Notes —1. Figures for the actual population 1921 (columns 4 and 5) are those given in Imperial Table II, 1921.

2. Vital statistics being available for the Baluch Trans frontier Tract of Dera Ghazi Khan District, its population has been omitted in calculating column 7.

3. While calculating the increase in Natural Population of the Punjab Provinces given in the last line of column 7, the figures of emigrants include figures for persons who be fore their birth-place as the figures of emigrants include figures for persons who be fore their birth-place as Punj b Unascertained.

4. Results for Natural Population by N tural Division, District or State can not be given where details of emigrants are not available in the Census.

5. Details of births and deaths by sex will be found in Subsidiary T ble V of Chapter V; birth and death registered in Cantonments are not included in that Table as they are not recorded by sex.

6. This Table includes 41,296 Birth and 20 104 Death registered in Cantonments.

CHAPTER II

CITIES TOWNS AND VILLAGES

80. General, 60 Division of population as rural 1 urban 61. Urban population 6... Population of towns by class 63. Individual cities and towns 64 Urban population b religions. 65. Urban sex-ratio 66 Rural population 67 Average size 1 distance between villages 68 Scheme tabulation of rural population 69 Rural population by religion

Reference to Statistics.

Imperial Tables.—The figures of urban and rural population (each detail) for each district and state and the number of towns and villages as well occupied houses in each are given in Imperial Table I. Towns and villages classified by population are shown in Imperial Table III, and towns similarly classified with population for the last fifty years in Table IV Certain deri tive results are given in Subsidiary Tables at the end of this Chapter

Subsidiary Table I shows average population of towns and villages as well as number per mille of total urban and rural population residing in towns and villages of each class by districts and natural divisions.

Subsidiary Table II shows the number per mille of the total population of each main religion he live in the towns of each natural division.

Subsidiary Table III shows the number of towns in each class according to actual population together with percentage of total urban population in each class well the number of females per 1,000 males in towns of each class. The increase per cent. in town of each cl ss is also given for all past censuses as well as the total increase for the past fifty years.

Subsidiary Table IV shows the total population of selected cities and towns (in number) in 1931, the number of persons per square mile, and the number of females per 1,000 males and of foreign-born persons per mille of the total population of each as well as percentage of variation in population t each of the past censuses (sin 1891) together with total increase per cent. since 1891.

Subsidiary Table V shows the number and population of towns by last for the last four censuses.

Subsidiary Table VI shows urba population by classes for 1931 and 1921 as well as variation in each class

Subsidiary Table VII show by cl les population of he towns th have remained urban for each of the last six censuses.

Subsidiary Table VIII gives the changes in populations of towns and cities, shown in Subsidiary Table VII, whether posi ive or negative in each of the five intercensal decades.

Subsidiary Table IX gives the total area of each tahsil showing the rel ative area of towns which have remained urban throughout for each of the last six censuses, urban and rural population separately and rural density of each tahsil for the two censuses, 1921 and 1931.

Subsidiary Table X shows the verage population and area per village in each tahsil.

Subsidiary Table XI shows the number of occupied houses, the population and the verage number of persons per house in each tahsil or state

General.

59 This Chapter deals with some aspects of the urban and rural popula tion of the Province By urban population is meant the *de facto* population of the cities and towns and by rural population all the persons enumerated in villages. The persons, enumerated on highways or in encampments boats or trains, etc are included in the figures of the towns or villages in whose limits they were enumerated though separate figures for these for ea h of the small r units are available by sex and religion in *Village Tables* Is *all the figures of* the census are of the *de facto* population (as pointed out in the last Chapter) thus procedure is the simplest and least objectionable in view of the small number of tra vellers, etc involved Moreover the accid ntal distribution of these person between town and *country can in th al sense* of any res on to th contrary be accepted as the result of a n ormal st te of affairs

Town

According to the Consu Cod a *Town* in Indes (1) every Municipality ( ) all Civil Lines not included within Muni cipal limit (3) every Cantonment (4) every other continuous collection of houses inhabited by not less than 5 000 persons, which the Provin ial Superintendent may decid to treat a town f w census purposes and (5) th c pital of every Indian Stat except th main r Simla Hill State

A manuscript copy of Village T ables prepared this census, has been supplied by the Superintendent of Census Reports each tah

City.

A '*city*' means—

(1) Every town containing not less than 100 000 inhabitants, (2) any other town which the Provincial Superintendent, with the sanction of the Local Government may decide to treat as a city for census purposes

The essential difference between a rural and an urban population is that the former is mainly engaged in agriculture and the latter in commerce, manufactures and other occupations Thus a place having a population of over 5 000 would be considered a village if it did not possess urban characteristics Of the places that the Provincial Superintendent classified as towns—and all of them except 23 had been treated as towns in 1921—51 were eventually found to have less than 5 000 inhabitants, while there were 103 'villages' which had a population of more than 5 000

Village,

A '*village*' (*deh*) means any area—

(*a*) for which a separate record of rights exists or

(*b*) which has been separately assessed to land revenue or would have been so assessed if the land revenue had not been released compounded for or redeemed, or

(*c*) which the Local Government may, by general rule or special order, declare to be an estate

This definition is the same as that adopted at previous censuses A village is a unit of area rather than a place of habitation For the same reason the number of villages in some of the hill states varies from census to census Indeed in the Himalayan Natural Division a village is a purely arbitrary division and though habitations are scattered in small groups of a few houses, the population of a village may sometimes amount to several thousands Some sort of arrangement for grouping the houses is however, necessary, and the one adopted at the census has the advantage of being familiar to the agency that is employed on the work Most of the Sub-Himalayan, the Indo-Gangetic Plain and the North-West Dry Area villages on the other hand, may be taken as being more or less units of habitation Here most of the revenue estates possess only one village site and the census record takes into account the number of inhabited villages only

The total population residing in the inhabited villages together with some moving population thus comprises the rural population

Division of Population as Rural and Urban

60 The major portion of the population of this Province is still rural The statement in the margin shows the percentage of the total population of the Province and its main political divisions classed as urban or rural at this and each of the past censuses Though the total population at this census has greatly varied as we saw in Section 4 of the last Chapter, the proportion of urban and rural population has fluctuated only within a comparatively small margin.

Urban and rural percentage of the total population

Year	Urban			Rural		
	Punjab	British Territory	Punjab States	Punjab	British Territory	Punjab States
1	2	3	4	5	6	7
1931	12 4	13 0	0 2	87 6	86 1	90 8
1921	10 3	10 7	8 7	89 7	89 3	91 3
1911	9 8	10 1	8 4	90 2	89 9	91 6
1901	10 6	10 6	10 5	89 4	89 4	89 5
1891	10 7	10 7	10 7	89 3	89 3	89 3
1881	11 9	12 0	11 2	88 1	87 9	88 8

Locality	Percentage of total population.	
	Urban.	Rural.
1	2	3
Punjab (1931)	13·4	7·6
England and Wales (1931)	80·0	20·0
Netherlands (1930)	43·6	31·4
Canada (1921)	49·5	50·5
France (1926)	42·3	57·7

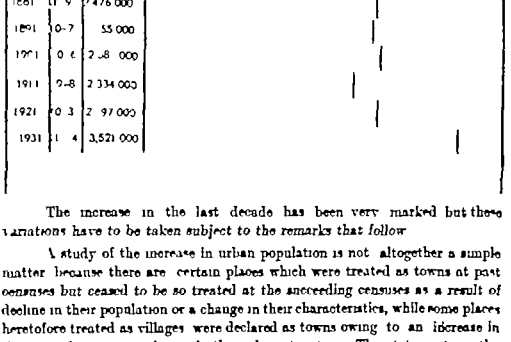

The marginal table compares the proportion of urban and rural population of this Province with the corresponding figures of some of the foreign countries the urban proportion for the Punjab is pro-

minent by its smallness.

Urban Population.

Census.	Urban Population.	
	Proportion (total figures).	Absolute figures.
1	2	3
Total	10·76	—4,58,329
1921	10·3	—434,901
1901	10·3	—301,795
1911	9·4	—334,445
1891	10·0	—386,875
1931	13·4	3,21,1440

01 The first four lines of the Imperial Table IV give the total urban population of the Punjab classified as such at each of the last six censuses the large actual increase noticeable is indicated by the table in the *margin* as *well as the diagram* below which shows the percentage it formed of the total population.

The increase in the last decade has been very marked but these variations have to be taken *subject to the remarks that follow*

A study of the increase in urban population is not altogether a simple matter because there are certain places which were treated as towns at past censuses but ceased to be so treated at the succeeding censuses as a result of decline in their population or a change in their characteristics, while some places heretofore treated as villages were declared as towns owing to an increase in their population or a change in their characteristics. The statement on the fly leaf to Imperial Table IV gives the number of the places together with the number of persons enumerated therein, which were added to or subtracted from the urban population at each census as a result of the changes in the number of towns. This statement also shows the variation in the population of those places that were towns at each of the sets of two consecutiv censuses In this connection it may further be remarked that the number of towns added or removed at each census as shown in this statement, is influenced by the fact that towns forming part of some other towns at one census and treated as separate at the next mean an increase in the number of towns. The total population however remains unaffected To take an instance Jutogh was treated as part of the Simla town at last censu but as it has no essential connection with it it has been shown separately at this census and has thus added to the number of towns.

Though the net increase in urban population shown on the fly-leaf to Imperial Table IV (after omitting variation due to inclusion and exclusion of towns) gives an idea of the increase in the urban population which remained urban at two consecutive censuses yet it is a fact that some of the towns newly added contain residents of places that were towns in the past but are no longer so For instance the decaying towns of Kamalia Dipalpur, Gogera and Shahpur ceased to be important because of many of their inhabitants having moved to the colony towns such as Lyallpur, Sargodha, Montgomery Okara, Gojra, etc Thus we have a set of people in the Punjab who are chiefly town-dwellers, and who on migrating from a decaying town settle in another urban area Some of them would undoubtedly be included in the population of the towns that are newly added at any census and will thus contribute to the increase in urban population caused by the inclusion of new towns The total increase on this score cannot therefore be rightly excluded from the real increase in urban population We could thus safely say that the real increase in urban population at a census comprises the whole of the increase in the population of the places classed as towns at that and the preceding censuses and some of the persons enumerated in the newly-added towns The gross increase in urban population during the last decade is 924,771 or 35 6 per cent over the population of 1921, while their net increase is 746,213 or 28 9 per cent in respect of the places treated as towns at both censuses

For the convenience of those who may be interested in the total population and its growth concerning places that are urban now and were also urban at each of the past censuses the table in the margin has been prepared In addition to absolute figures it gives the percentage of annual increase, distributed over the period intervening between the present and each of the past censuses

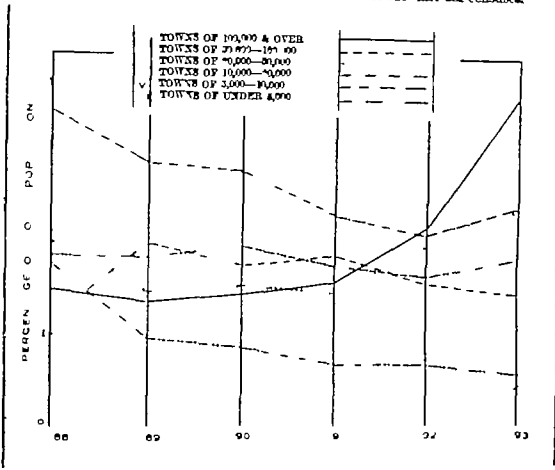

Places treated as towns in 1931 as well as at previous censuses

Particulars 1	1881 2	1891 3	1901 4	1911 5	1921 6
Number	168	163	166	167	185
Population	2,043,692	2,105,017	2,330,279	2,305,574	2,585,455
Absolute increase till 1931	1,107,407	910,194	840,222	905,059	746,213
Annual increase per cent till 1931	1 08	1 04	1 20	1 97	2 89

62 At the present census the towns with a population of 5,000 to 10,000 comprise the largest number, *i e*, 96 Their population forms 2 4 per cent of the total population and 19 1 of the urban population Towns having a population of between 20,000 and 50,000 each are 24 in number, and their aggregate population bears the same proportion to the total population as the class mentioned above The class comprising towns with less than 5,000 inhabitants has 51 towns, but their total population forms only 6 per cent of the total population There are only five towns (inclusive of cantonments) with a population of more than 100,000, and six with a population of between 50,000 and 100,000 each The former class of towns claims 3 6 per cent of the total population, the highest proportion for any class, while the population of the latter is 1 5 per cent of the total

Population of Towns by Class

Curves in the diagram below show the percentages of total population which resided in towns of each class at the time of the last six censuses.

It appears that until 1911 the tendency of the bulk of the urban population was to reside in smaller towns, as indicated by the fact that the curve of the class relating to places with a population of 100 000 or more was one of the lowest. Towns with a population of 3 000 to 10 000 were the most popular and these were evidently the typical urban areas, mainly serving as market towns for rural localities. The tendency of real urbanization, or the crowding of population into large towns started two decades ago as indicated by the abrupt rise of the unbroken line for cities, the main reason being the development of industries. The smaller variation in other classes at various periods is *due to some growing towns passing from one class to another with considerable* rapidity and thus temporarily swelling the figures.

There are 10 towns or cities which have made uninterrupted progress during the last fifty years. These are noted in the margin together with the increase per cent of population since 1881. On the other hand there are three towns, which have been continuously losing in population at each census and these are Pind Dadan Khan (Jhelum District) Buria (Ambala District) and Dagshai (Simla District) The last named is a cantonment.

Town.	Increase per cent. 1911 1931	Town.	Increase per cent. 1881 1931
Lahore	167	Faridkot	134
Multan	129	Kotkapura	422
Jullundur	70	Maktsar	274
Ferozepur	146	Chamkaur	6571

Jhang	66	Leiah	42
Rohtak	121	Jampur	109
Montgomery	72	Phillaur	53
Dharmsala	317	Muzaffargarh	144
Simla	109		

Individual Cities and Towns.

63 We shall now proceed to study the growth of some of the individual cities and towns The figures of the population of towns at past censuses are given in Imperial Table IV and the population shown therein represents the number of persons found living within their limits at the time of each census In cases in which at a subsequent census the limits of the towns have been extended, the population of the new area is given, no attempt being made to quote the rise in population due to the increase in area This is contrary to the procedure adopted in the case of districts whose figures in Table II are given after necessary adjustment This procedure apart from being simple is meant to save confusion, as the administrators as well as the public are anxious to have the figures for municipal or other well-defined areas The population of the outskirts of towns, however, is given by religion and sex in Village Tables for the use of administrative officers, and in the case of Municipalities, it is shown as "*Berun Hadud*" (outside municipal limits) against the revenue estate or village, in whose limits it is situated

At the last census there were three cities with a population of more than 100,000, namely, Lahore, Amritsar and Multan To these might be added Rawalpindi and Sialkot which now (inclusive of cantonments) have a population exceeding one lakh The towns of Jullundur and Ludhiana are growing at a good pace, and the former is now not much behind the one lakh figure The towns of Ambala and Ferozepore with their cantonments are also fairly large, and all these towns and cities are designated as "selected towns" for census purposes The figures of birth-place have been shown for all of them in Table VI, Part C, and of literacy in Table XIII, Part C, while in Table VII, Part C, figures of these places as well as of Ludhiana, Lyallpur and Sargodha have been given by age and civil condition The statement in the margin shows the annual increase in the population of the cities and selected towns at each census since 1868

SELECTED TOWNS (1868—1931)

Annual percentage of variation

Serial No	Town.	1868 to 1881	1881 to 1891	1891 to 1901	1901 to 1911	1911 to 1921	1921 to 1931
1	2	3	4	5	6	7	8
1	Lahore	+5 1	+1 2	+1 5	+1 3	+2 3	+5 3
2	Amritsar	+1 2	−1 0	+1 9	−0 6	+0 5	+6 5
3	Multan	+2 1	+0·9	+1 7	+1 4	−1 5	+4 1
4	Rawalpindi	+17 6	+3 9	+1 9	−0 1	+1 7	+1 8
5	Ambala	+13·3	+1 8	−0 1	+0 2	−0 5	+1 4
6	Jullundur	+5 5	+2 7	+0 2	+0·2	+0 2	+2 5
7	Sialkot	+8 1	+2 0	+0 5	+1 2	+0 9	+4 3
8	Ferozepore	+9 2	+2 8	−0·2	+0 3	+0 7	+1 9

With a view to ascertain what contributes to the increase in the population of cities and selected towns, it will be useful to examine the natural increase in each of these urban areas during the last decade and the increase due to migration In the table below is given the population in 1921 and 1931 according to the place of birth as well as the number of births and deaths recorded during the last decade together with the excess of the former over the latter

City or selected town	Total Population 1931.	Increase in population during the decade	Births.	Deaths.	Excess of Births over Deaths	City born individuals		Born outside the city but within the district.		Born outside the district	
						1931	1921	1931	1921	1931	1921
1	2	3	4	5	6	7	8	9	10	11	12
Lahore City	429,747	147,966	96,035	84 631	11,404	209,273	127,929	15,328	29,857	205,146	123,995
Amritsar ,,	264,840	104,622	79,432	62,584	16,848	211,162	124,810	8,375	6,386	45,303	29,022
Multan ,,	119,457	34,651	40,455	30,273	10,182	76 097	62,332	20,968	3,506	22,392	18,968
Ambala Town	86,592	10,266	10,307	7,550	2,757	55,407	42,056	55,407*	48,421	31,185	27,905
Jullundur ,,	89,030	18,022	29,035	17,881	11,154	57,073	46,368	13,631	9,196	18,326	15,444
Ferozepore ,,	64,634	10,283	10,472	6,958	3,514	32,368*	25,980	32,368*	31,055	32,266	23,296
Sialkot ,,	100,973	30,354	30,283	19,767	10 516	83,207*	45 549	83,207*	58,245	17,766	12,374
Rawalpindi ,,	119,284	18,142	23 161	19,370	3,791	45,638	36,715	17,368	10,625	56,281	53,802

*These figures relate to total district-born including city born.

It will be seen that the natural increase forms only a small fraction of the actual rise in urban population. The figures of the city-born are obviously unreliable, as for instance, there is an increase of 81,354 in the city born enumerated in Lahore as compared to the excess of births over deaths, amounting to 11 404 It is absurd to suppose that all persons born in the city have survived and all persons with foreign births have died during the last ten years, or that at the time of the census a large number of the city born returned to the city of their birth. The figures in other columns seem reliable enough. Thus Lahore City as well as Rawalpindi gains comparatively more by immigration of persons born outside the districts of Lahore and Rawalpindi respectively Amritsar Jullundur and Sialkot are, however not indebted to any such immigration for their growth.

Subsidiary Table IV gives figures of population, density sex proportion and immigration for these units. Certain other particulars regarding these urban areas are set forth below

Lahore—The city (including the municipality and the cantonment) has an area of 39·38 square miles, and a population of 429 747 both being the largest in the Province, and its gain in population during the last decade is 52·5 per cent. The population has developed steadily ever since 1881 the rise in the first decade (1881—91) being 19·4 and in the next 14 8 per cent. The present population shows an increase of 187·7 per cent. as compared to 1881 The municipal town, which includes the Civil Station has an area of 26·06 square miles and a population of 400 075 which give a density of 15 352 persons to the square mile. The portion of the town within the old walls has a population of 176 792 persons living on 570 acres, i.e. a density of 310 persons per acre or in other words each person has at his disposal a space of 13 square yards. There is little or no scope for expansion within the walled town except in the form of more storeys being added to the existing buildings.

The tendency to live in detached houses of the European bungalow type is on the increase as shown by the large portion of the population residing in the area, called the Civil Station. It is in this area that the rise in population has been enormous during the last decade. The municipal town now extends from Baghbanpura in the east to Rajgarh and Chauburji Gardens Estate in the west and from the river Ravi in the north to the Jail and Mental Hospital in the south. The Civil Station has become linked up with the Cantonment by an almost continuous chain of houses. Its expansion is not confined to the municipal limits, and bungalows have already been built on the Ferozepore Road for a considerable distance outside those limits. The Civil Station continues to expand and we may reasonably expect that at no distant date it will extend up to the Model Town. The present population of the different parts of the municipal town together with the figures of area is given in the margin.

Locality	Area in acres.	Population.

Amritsar—This was the largest city of the Province

till the census of 1881 in respect of population, but since then it has yielded the place of honour to Lahore The table in the margin compares population of the two cities and their percentages of increase since 1868 The figures indicate that the population of Amritsar showed a decrease at two censuses, namely, 1891 and 1911, while the population of Lahore has been on the increase throughout At this census the population of Amritsar, which is nearly two-thirds of that of Lahore, has shown a record increase of 65 per cent, a considerable portion of which is due to artificial causes as remarked in paragraph 55 The area of the city excluding the cantonment is 10 square miles, giving a density of 24,844 persons per square mile as against 15,352 in Lahore The increase in the number of persons per square mile is 11,141 as against 5,479, which is the corresponding figure for Lahore The increase in the density of Amritsar is thus double that of the capital town and denotes more congestion Amritsar continues to be an important commercial centre, having as its chief feature the wholesale trade in piece-goods and the manufacture of carpets, woollen fabrics and chemicals

Census	Amritsar City		Lahore City	
	Population (000's omitted)	Increase or decrease per cent	Population (000's omitted)	Increase or decrease per cent
1	2	3	4	5
1868	136		99	
1881	152	+12	149	+51
1891	137	−10	177	+12
1901	162	+19	203	+15
1911	153	−6	229	+13
1921	160	+5	282	+23
1931	265	+65	430	+53

Multan —The population of Multan in 1921 was 84,806 Owing to the prevalence of plague at the time of the census, a considerable number of persons had left their homes temporarily, and it was therefore decided to hold a supplementary enumeration in August 1921 when normal conditions were restored The supplementary census revealed a population of nearly a lakh As against this the present population is about 119,000, which means an increase of 19 per cent during the last decade

Rawalpindi —The development of Rawalpindi took place mainly during the period 1881—1901 as a result of its importance as a military station In recent years the rise in its population is due to the large motor and lorry traffic, particularly on the Murree-Kashmir Road During the last fifty years its population has more than doubled, and is now almost equal to that of Multan, though its area is two square miles less Nearly three-fifths of the inhabitants of Rawalpindi are foreign-born, and there is nothing surprising about this high proportion as a very large portion of the inhabitants are there on account of the existence of the cantonment

Sialkot —The population of Sialkot has doubled during the last thirty years The increase during the last decade amounts to 43 per cent, and the population of the municipal town and the cantonment now exceeds one lakh Referring to the large increase, the Deputy Commissioner of Sialkot says— "It is due to the fact that the Sialkot town is in flourishing condition, largely carrying on the sports trade for which most of the craftsmen and artisans of the neighbouring villages have taken up their abode in the city, and many of them who used to return to their villages after the day's labour, might have been detained on the night of the final census for swelling the figures of the population as the elections of the local bodies are carried out on communal lines" This, however, does not fully explain the enormous rise which has taken place, and it is probable that part of the increase is attributable, as in the case

of Amritsar to bogus entries The area of Sialkot Municipality is 6 square miles and that of the Cantonment 0·5 square miles.

Among other towns the growth of Lyallpur and Gujranwala is remarkable. The former owes its prosperity to its position as the headquarters of the premier colony district, and the latter to its great industrial development brass copper and bronze utensils, and iron safes and almirahs being its main manufactures.

Urban Popu lation by Religion.

64 The marginal table shows the distribution of 10 000 of total urban population by religion for each census. The figures indicate that on the whole proportionately more Hindus are urban than Sikhs and Muslims, their proportion in towns being considerably higher than in the total population. This table does not, however express the peculiarities of different parts of the Province. Proportionately more Muslims are urban than Hindus in the eastern Punjab while in the west the reverse appears to be the case. The table in the margin shows the percentage of the followers of each of the main religions enumerated in urban and rural areas of the eastern and western parts of the Province. In the eastern Punjab where Hindus generally predominate in the total population Muslims reside in urban areas in proportionately larger numbers, while in the western parts which are predominantly Muslim, the urban population has a large proportion of Hindus.

Year	Hindu.	Muslim.	Sikh.	Christian	Others.
1	2	3	4	5	6
1931	2,763	5,199	776	180	129
1921	2,621	5,090	879	206	96

Urban Sex Ratio.

65 A brief mention may be made here of the figures of sex ratio, which will be discussed at length in Chapter V These figures are given for cities and towns classified by population in Subsidiary Table III and are reproduced in the margin for convenience of reference. It is noticeable that the bigger the towns the smaller is the number of females per 1 000 males. The towns with a population of less than 10 000 inhabitants have a comparatively higher proportion of females Such towns in many cases are really overgrown villages and in them the proportion of the sexes remains practically unaffected by immigration.

Town.	Females per 1,000 males.
1	2
Over 100,000	852
50 000—100,000	894
20 000—50,000	724
10 000—20,000	722
5 000—10 000	730
Below 5 000	774

Rural Population.

66. In the last Chapter was discussed at length th density of the rural population in each district and of th total population in each state and a repetition is unnecessary here. The districts in which there has been a considerable increase in the number of inhabited villages during the last decade are shown in the marginal table The increase may almost entirely be ascribed to the extension in canal irrigation It is noteworthy that non of the 4d districts such as Jullundur Hoshiarpur and Gurdaspur figures in the list.

District.	Increase in number of Villages.
1	2
Multan	249
Montgomery	123
Shahpur	114
Lyallpur	109
Dera Ghazi Khan	2
Mianwali	73

Average Size and Distance Between Villages

67 Subsidiary Table I gives the average population per village for each district, and it can be remarked that in the districts with an extensive well irrigation, such as Hoshiarpur, Gurdaspur and Sialkot, an average village is comparatively small, though in certain districts of the same type such as Amritsar, Jullundur, Lahore and Gujrat, the village is slightly larger In hilly tracts there is no uniformity and this is entirely due to the arbitrary grouping of habitations into villages Thus an average village in Chamba has 2,654 inhabitants, in Kangra 1,113 in Sirmoor 146, and in Mandi State only 54 In the districts and states with large areas solely dependent on rainfall and with no facilities for the supply of drinking water the villages are comparatively larger, such as Hissar (963) and Rohtak (722) In rich tracts like Lyallpur, the village is developing in size owing to the larger number of persons finding it possible to be sustained on the produce of the neighbouring lands In other districts such as Mianwali and Attock the necessity of protection against raids, arbitrary grouping of villages owing to the broken nature of the country and the desert conditions account for the comparatively bigger villages

The number of residential villages and census villages is almost identical in the Punjab plains, and it may be of some interest to calculate the mean distance between villages for the various districts and states * The necessary figures are given in the statement below

District or State and Natural Division	Average distance between inhabited villages	District or State and Natural Division	Average distance between inhabited villages	District or State and Natural Division	Average distance between inhabited villages

Some Statistics of Rural Population

68 As the rural population for Natural Divisions is not readily obtainable from the tables it is being given in the marginal table, figures for British Territory and Punjab States are also given for facility of reference The number of females is highest in the

Locality	Persons	Males	Females	Number of females per 1 000 males
Punjab	24,969,408	13,495,945	11 473 463	850
British Territory	20 513,388	11 074 638	9,438 750	852
Punjab States	4,456,020	2,421,307	2,034,713	840
Indo Gangetic Plain, West	10,732,466	5 842,342	4,890 124	837
Himalayan	1,771,060	920,635	850 425	924
Sub Himalayan	5,781 109	3,099,679	2,681 430	865
North West Dry Area	6,681 773	3 631 289	3,051,484	840

* $d^2 = \frac{200}{\sqrt{3}}$ or $\log d = 1{\cdot}03125$ (a constant) $- \frac{\log n}{2}$, where d = distance between each village, and n is the number of villages in 100 square miles If N be the number of hexagons in 100 square miles, $n = 3N$

The area of one hexagon $= \frac{3d^2\sqrt{3}}{2}$

and that of N hexagons $= \frac{3N\,d^2\sqrt{3}}{2}$

$= \frac{nd^2\sqrt{3}}{2}$

$=$ (by hypothesis) 100 square miles

Hence $d^2 = \frac{200}{n\sqrt{3}}$, or $\log d = 1{\cdot}03125$ (a constant) $- \frac{1}{2}\log n$

Himalayan and lowest in the Indo-Gangetic Plain. The proportion of females in rural population is everywhere higher than in the total population.

Rural Population by Religion.

69 The statement below shows the total rural population by religion, enumerated in British Territory Punjab States and each Natural Division. These figures too like those given above are not readily available from any of the tables.

Locality 1	Hindu. 2	Sikh. 3	Muslim. 4	Christian. 5	Others. 6
Punjab	7,174,073	3,818,034	12,101,961	332,808	434,736
British Territory	6,207,341	2,838,463	11,772,930	249,152	400,822
Punjab States	2,971,734	987,571	1,998,341	3,456	34,088
Indo-Gangetic Plain, West	2,967,824	2,447,806	4,231,716	184,899	220,902
Himalayas	1,802,729	7,346	30,730	858	23,367
Sub-Himalayas	1,221,626	702,822	2,828,453	106,674	119,122
North-West Dry Area	696,676	436,308	5,253,040	73,479	74,779

The results derivable from the above figures are given in the marginal table which shows the distribution of 1 000 of the total population of each unit by religion. The figures will be useful for purposes of reference. A similar detail for each district or state can be obtained by the subtraction of the figures of Table V from those of Table XVI No comment is called for

CHAPTER III.

BIRTH-PLACE AND MIGRATION

70 General 71 Casual migration 72 Other kinds of migration 73 Temporary migration 74 Periodic migration 75 Semi permanent migration 76 Permanent migration. 77 Reasons for small amount of migration

The main statistics are given in Imperial Table VI which contains statistics of birth place for the Province as a whole as well as for British Territory and Punjab States and for each district and state It also gives figures by birth place within the Province for colony districts and Bahawalpur State as well as for cities and certain selected towns Reference to Statistics.

Subsidiary Table I gives details of immigration (actual figures in thousands) into the Province, its two main political divisions as well as for each district or state

Subsidiary Table II gives details of emigration (actual figures) from the Province as well as from British Territory and Punjab States Figures of intermigration between British Territory and Punjab States are also given

Subsidiary Table III gives details of migration between the Punjab Province and other parts of India The figures are also compared with those of 1921 and the variation is given

Subsidiary Table IV shows details of emigrants by sex outside the Punjab

70 The enquiry into birth-place of the persons enumerated is one of the most important made at a census The statistics obtained from it, as noticed in the first Chapter, helped to explain the great increase in the population of certain places such as the Montgomery and Multan Districts and Bahawalpur State These statistics are also useful for the calculation of the Natural Population of the Province and to facilitate the determination of sex proportion in it The study of migration, which is rendered possible by these figures alone, throws light on industrial and other economic conditions General.

In Chapter I an attempt was made to examine the pressure of the population on resources, and it was indicated how from the districts where such pressure was considerable, a steady emigration to colony areas in the Province had been in progress In Chapter IV we will trace the effect of migration on age distribution of the population and in Chapter V its effect on the sex constitution Here we will attempt to gauge as far as possible the direction and extent of various kinds of migration

It is appropriate in the beginning to define the five well-known types of migration

(1) *Casual Migration* —Or the minor movements between adjacent villages These affect the returns only when the villages in question happen to lie on opposite sides of the line which divides one district from another

In this type of migration females generally preponderate It arises largely from the very common practice amongst certain communities, chiefly Hindus, of taking a wife from another village, and from the fact that young married women often go to their parents' home for their first confinement

(2) *Temporary* —Due to journeys on business, visits to places of pilgrimage and the like, and the temporary demand for labour when new roads and railways are under construction

(3) *Periodic* —Such as the annual migration which takes place in different tracts at harvest time, and the seasonal movements of pastoral nomads

The amount of temporary and periodic migration varies greatly at different seasons of the year

(4) *Semi-Permanent* —The natives of one place reside and earn their living in another, but retain their connection with their own homes, where they leave their families and to which they return in their old age, and at more or less regular intervals in the meantime

(5) *Permanent* —Where overcrowding drives people away or the superior attractions of some other locality induce people to settle there

Another form of migration which is probably increasing in India is what may be called daily migration, the practice of living outside some large urban area and coming and going daily for business of one kind or another

Before discussing the characteristics and if possible the volume of each kind of migration it will be necessary to explain the extent to which the figures at this census are different to those at the last census. The enumerators were instructed to note down the district of birth in the case of all persons born in an Indian province the name of the state in the case of those born in an Indian state and the name of the country in the case of those born outside India. In the case of a few Indian states, viz Hyderabad Deccan Baroda, Mysore Gwalior and Kashmir the name of the district was also to be specified. In tabulation however for reasons of economy the details by districts were dispensed with and only the number of persons born in the district or state of enumeration was shown, all the other districts of British Territory or states within the Province being lumped together In the case of the districts of other provinces figures were lumped by the province the states being treated similarly Migration figures in the case of colony areas are important and for the colony districts in the Punjab and Bahawalpur State, where colonization has been in progress during the last decade, the figures of birth-place by each district and state of the Province were tabulated separately The procedure adopted therefore precludes a study of inter-district migration except the emigration to colony areas. For the same reason the Natural Population for individual districts and states or for Natural Divisions cannot be calculated It has only been calculated for the Province, British Territory and Punjal States and will be found in Subsidiary Table IV to Chapter I.

Casual Migration.

71 The study of the casual type of migration has suffered most as a result of the curtailed tabulation of it i only possible if birth-place figures by districts and states are available. At the same time it is a fact that such migration though comparatively large in volume balances itself as in most cases movements from and to a district or state are fairly equal. To this class of migration belong the large number of women married to men born in a district or stat other than their own. The children born to such women especially at their first confinement are also included in the casual type of migration a there is a widespread custom requiring young wives to go to their parents hom for their first confinement The characteristic of this type of migration can however be seen from the migration between the British Territory f the Punjab and the villages of Delhi Province If the figures of persons, enumera ted in those villages and born in the neighbouring Punjal Distr t such as Gurgaon, Rohtak and Karnal, were available the effect could have been still better appreciated. The corresponding figures of immigrants from Delhi Province are however available for these district and are given in the marginal table

Born in Br Punjab Territory enumerated in Delhi Pr ince		Born in Delhi Province enumerated in Gurgaon Rohtak Karnal Districts.	
Persons	2,765	Persons	22,167
Males	6,939	M les	967
Females	21,706	F males	13,264
F males per 1 000 males.	3 063	F males per 1 000 m les.	2,617

Among th immigrant the preponderance of females is at once visibl The number of females per 1 000 males in one case is as high as 3 065 and in the other 2 61 Such a sex proportion is the character tic of th casual type of migration in al tricts where Hindus form the bulk of the population.

Th extent of th immigration from the Rajputana Agency to Hi sar and Gur aon and from the United Provinces to Karnal, Ambal and Ambala

can be easily determined from Imperial Table VI, and most of it is of the casual type The results obtainable are practically similar to those, ascertained above for Delhi Province, the figures of immigrants being 50,236 males and 86 795 females

The conditions in another part of the Province are slightly different The immigration from the North-West Frontier Province to the Districts of Attock, Rawalpindi and Mianwali does not seem to be entirely of the casual type, and is very small in extent when compared with the migration on the eastern border The figures given in the margin show the population involved as well as the proportion it forms of 1,000 of the total population of the districts The number of females is actually less than males unlike what we find in the eastern districts, where the females are in a large majority among the immigrants This is accounted for by the fact that the Hindu population of the eastern Punjab is exogamous, while the Muslims of the west are almost entirely endogamous

Immigrants from N W F Province to				
District	Males	Females	Females to 1 000 males	Proportion per 1,000 of total
Attock	3,306	2,452	722	10
Rawalpindi	7,801	4,054	520	19
Mianwali	2,618	2,312	893	12

District	Immigrants per 1 000 of the population
Karnal	10
Rohtak	9
Gurgaon	51

72 The remaining kinds of migration affect a very small proportion of the total population of the Province, as will be seen from the figures in the marginal table, which gives the distribution of ten thousand of the total enumerated population of both sexes according to birth-place It can be calculated from the figures in the marginal table that 86 per cent of persons (48 males and 38 females) were enumerated in the district or state of their birth, while 97 6 per cent of the "actual population" were born and enumerated within the Province Thus immigrants of all kinds amount to less than 3 per cent, of which about 2 per cent belong to contiguous provinces This immigration is almost entirely confined to the districts of this Province lying on the border, and as explained above is mostly of the casual type The immigration from other Indian Provinces would thus be nearly 1 per cent of the total population, while all the Asiatic countries and other foreign countries together contribute less than 2 per cent

Other Kinds of Migration.

Birth place	Per 10 000 of total enumerated population	
	Males	Females
I India	5 450	4,534
(a) Punjab	5 341	4 422
District or state of enumeration	4,802	3,816
(b) Contiguous provinces with states	104	108
(c) Others	5	4
II Asiatic countries	7	2
III Foreign countries	6	2

73 Temporary migration though considerable in extent is difficult to determine from the census data The date of the census was selected so as to conflict least with fairs or pilgrimages so that migration on that account was at its lowest The only temporary movements at the time of the census would therefore be of a certain number of labourers from Rajputana Agency and Ajmer-Merwara All persons born in these areas and enumerated in the Province except the districts or states bordering on Rajputana, Hissar, Gurgaon and Ferozepore Districts and Loharu Pargana Nabha and Jind States, may be regarded as temporary migrants These numbered 83,397 males and 116,298 females Temporary migrants in other parts

Temporary Migration

are probably very few Temporary emigrants from the Punjab are those who leave the south-eastern districts such as Hissar and Gurgaon, and Loharu State, and seek labour in places like Delhi. During the last decade a large number of persons from these areas has emigrated to work on the canals of the Sutlej Valley Project. The number of persons, born in Hissar and Gurgaon and enumerated in Bahawalpur and Multan, is given in Imperial Table VI and practically the whole of it is due to temporary migration. The figures of emigration to the colonies during the decade are given in paragraph 76.

Periodic Migration.

74 The periodic movements of the population in this Province are mostly confined to inter-district migration. They generally take the form of the return, to rural areas at harvest time of a large number of persons who seek employment in large towns at other seasons. For example, rickshaw coolies and other labourers in Simla go back at the end of the hot weather to their lands in the Hoshiarpur and Kangra Districts. Very few field labourers are attracted from across the borders of the Punjab When the wheat crop matures in the spring there is an influx of labourers to the colony areas where the holdings are comparatively large and additional help is needed for the cutting of the crop During the early months of autumn cotton-pickers flock to the colony areas and the rice crop in the rice-growing tracts also attracts numerous labourers. The spring harvest season, which begins in the Province early in April, is one of considerable activity It is preceded by rejoicings on a large scale. The *Baisakhi* fair is held in numerous places and synchronises with the commencement of the cutting of wheat crop. The *zamindars* are in real holiday mood and seem to work up an enthusiasm to last throughout the harvesting period, which is very trying the sun becoming hotter day by day and the clearer and warmer the day the more welcome it is to those engaged in harvesting operations.

There is also an increasing periodic migration of well to-do persons to the hills in summer as borne out by the large disparity between the winter and summer populations of hill-stations. The marginal figures, which are at this census available only for the Simla municipal area, show that its summer population taken on the 30th June 1931 was nearly three times that obtained at the general census held in the end of February

Census.	Persons.	Males.	Females.
1	2	3	4
Winter	18,144	13,667	4,477
Summer	51 704	37 157	14,547

While the plain dwellers go to the hills in summer the hillmen of the lofty ranges leave their homes with their sheep and cattle to spend the winter in the valleys and plains of the neighbouring districts. The census returns of birth place are thus affected to a certain extent. The traders and labourers from Kabul and the surrounding territory are periodic visitors of the Punjab plains, and at the time of the census the number of Afghanistan born persons in the Punjab was 14 854 (males 11,020 and females 3 834). Most of them go back to their homes at the end of the winter to come out again in the beginning of next winter or to be succeeded in this movement by other countrymen of theirs. The number of persons, who returned Kashmir as their birth place is 79 691 (males 46,342 and females 33,349) and a considerable portion of them sojourn in the Punjab only during the winter months. They are found scattered all over the Province except the south-eastern part and are engaged in strenuous kinds of labour such as the carrying of heavy loads and chopping of wood. Some

of these periodic visitors bring merchandise for disposal in the towns of the Punjab

Numerous men belonging to some of the Punjab districts emigrate in winter to the United Provinces to carry on a trade in coarse cloth The number of the Punjab-born, enumerated in the United Provinces, is nearly 98,000 (males 53,000 and females 45,000), and if from these the casual migrants to adjoining districts were excluded the periodic migrants would form a large portion of the rest

Semi permanent Migration

75 The immigrants who belong to this category are those who have come from their home districts to cities and large towns These men presumably migrate to make a living, and after spending a number of years in such areas return to their homes with which they always keep in touch The great majority of government officials and employees of railways and other commercial institutions belong to this category, as also students and workers in large industries and workshops Practically all Europeans and those with their birth-place in one of the Presidencies (Bengal, Madras and Bombay), enumerated in this Province, may safely be regarded as belonging to this class The same could be said of a number of persons born in the United Provinces, who happened to be in the Punjab at the time of the census The large majority of the U P men were of course found in the contiguous Punjab districts and belong to the class of casual migrants

Permanent Migration

76 An example of the largest wholesale permanent migration within the Province is the migration to canal colonies This movement, which has been operative for the last forty years or so, is not likely to show for some time to come any signs of abatement The Districts of Lyallpur and Shahpur, which were the first to be colonized, are no longer the centres of attraction, and more recently their place has been taken by the Montgomery and Multan Districts and Bahawalpur State

The number of persons, enumerated in the colony districts and Bahawalpur State and born in the other Punjab districts and states, is shown in Part C of Table VI The colony districts include Lyallpur, Shahpur, Multan and Montgomery and parts of Gujranwala, Sheikhupura and Jhang The number of persons who actually emigrated from each district to the colony districts and Bahawalpur State in the last ten years is given in the margin

Statement showing the actual number of emigrants to all the colonies (taking the colonies as one unit) from each district during the decade

District	Number of calculated emigrants during the decade	District	Number of calculated emigrants during the decade
1	2	1	2
Hissar	3,057	Lahore	22,229
Rohtak	3,264	Amritsar	32,605
Gurgaon	2,877	Gurdaspur	15 952
Karnal	1,142	Sialkot	26,047
Ambala	2 449	Gujrat	21,896
Simla	62	Jhelum	10,865
Kangra	1 327	Rawalpindi	5,777
Hoshiarpur	17,490	Attock	4,039
Jullundur	24,664	Mianwali	5 853
Ludhiana	11,144	Muzaffargarh	6,705
Ferozepore	17 433	Dera Ghazi Khan	3,460

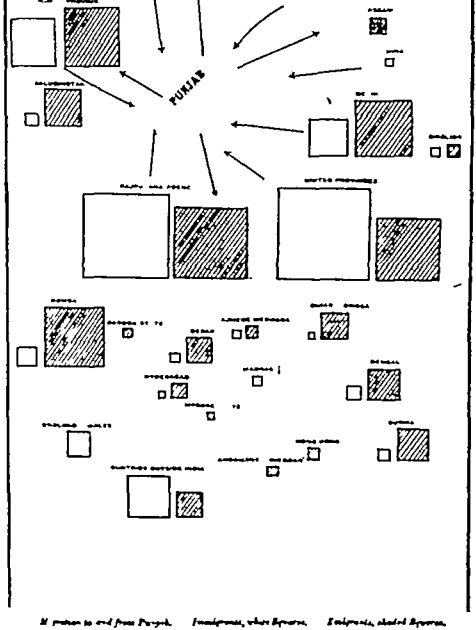

A death-rate of 20 *per mille* has been assumed for the old colonists of 1921 as well as for the new immigrants during the decade Most of these persons may safely be assumed to be permanent migrants It may be remarked that the number of persons migrating during the last decade has been calculated by the method explained in Section 6 of Chapter I That method, in brief, is the application of a certain death-rate to the number of immigrants of the 1921 census It can thus be realized that in case the stream of immigration into a colony district ceased altogether, the old immigrants would die and the population of the district will mostly consist of the district-born persons

This would explain the reduction in the number of persons born in certain districts and enumerated in the colonies at a census when compared with the previous one. All the colonies when they grow beyond a certain stage are bound to show this result sooner or later.

The number of persons who come from outside and settle in the Punjab or of those, who leave the Province to settle elsewhere, is infinitesimal as compared with the number of migrants to canal colonies.

Reasons for small Amount of Migration.

77 To get a clear idea of the amount of migration to and from this Province the reader is referred to the diagram below

M. persons to and from Punjab. Immigrants, white Squares. Emigrants, shaded Squares.
Each one square inch represents 500,000 persons.

The white squares represent immigrants to and the shaded squares emigrants from this Province The area of the square is proportionate to the number of persons migrating

The reason for the small amount of migration of all kinds was given in 1911 as the proverbial love of the Punjabi for his native land, which made him content with "*ghar ki adhi, bahir ki sari* " (half a loaf at home is as good as a whole away from it) The real reason however appears to be the one which stands in the way of urbanization, *viz*, the dependence of the population on land for subsistence Food being the primary necessity of human life keeps people attached and busy with the land Leisure and off-season are unknown to a peasant, who has constantly to be near his crop to get a living wage out of it and sometimes even less The few moments of leisure, which he can have, are spent in litigation, of which there is no dearth Thus migration has no attractions for the agricultural population except when it is calculated to relieve the pressure on resources by holding out a better agricultural prospect and its attendant profits in the form of the lease, occupancy or ownership of colony land. A considerable portion of the population consists of artisans and menials, but even they are supported indirectly by agriculture, and they also do not find any better substitute for their work to entice them away from their homes

SUBSIDIARY TABLE I.

Immigration to all Districts and States of the Province.

Actual Figures (000's omitted)

Serial No.	DISTRICT OR STATE OF ENUMERATION.	BORN IN: District or State of enumeration. Persons	Males	Females	Other British Districts and in case of states in British Districts. * Include the figures of those persons who returned their birth place as "Punjab Unspecified"

SUBSIDIARY TABLE III

Migration between the Province and other parts of India

Note (1) *This table is divided into three parts*—

(i) Showing the total figures of immigration to and emigration from the whole of the Punjab (with details of British Territory and Punjab States) taking all the other Provinces of India together

(ii) Containing details of migration between the Punjab Province (British Territory and Punjab States) and the British Territory of each of the other provinces

(iii) Giving similar details of migration between Punjab Province (British Territory and Punjab States) and the Feudatory States of the other Provinces

Note (2) In case of emigrants, persons returning their birth place as "Punjab Unspecified" are included in the total figures of emigrants to each Province or State, and their number can be obtained by subtracting the total born in each of the two divisions of this Province from the total emigrants

CHAPTER IV.

AGE

78 Introductory 79 Peculiarities of age returns 80 Smoothing of figures 81 Different methods of recording age 82 Age distribution at different censuses 83 Variation in individual age groups 84 Age distribution compared to other countries 85 Mean age 86 Mean age in Natural Divisions 87 Longevity in different areas 88 Quinquennial births and age groups 89 Census as a test of vital record. 90 Effect of migration on age distribution 91 Age distribution by caste

The figures of the population by age and civil condition are given in Imperial Table VII, for all districts and states as well as cities and selected towns The figures of the age distribution of each individual town in the Province are given in Table VII D in Part III The age statistics for certain castes are given in Imperial Table VIII

Reference to Statistics.

Subsidiary Table I shows the age distribution of 10,000 of each sex in the Province and each Natural Division for the last six censuses

Subsidiary Table II gives the same information as Table I for main religions along with the mean age of each sex

Subsidiary Table III gives the age distribution of 1,000 of each sex in certain castes

Subsidiary Table IV gives the proportion of children under 14 and of persons over 43 to those aged 14—43 in certain castes, also of married females aged 14—43 per 100 females of all ages

Subsidiary Table V gives for the last five censuses the proportion of children under 10 and of persons over 60 to those aged 15—40 also of married females aged 15—40 per 100 females, while Subsidiary Table V A gives the same information for main religions by Natural Divisions

Subsidiary Table VI shows the percentage of variation in population at certain age periods

Subsidiary Tables VII and VIII give the reported birth rate and death rate, respectively, by sex and Natural Divisions

Subsidiary Table IX gives the death rate by age periods and sex for each year of the last decade *per mille* of the population living at same age according to the census of 1921

Subsidiary Table X gives the actual number of deaths by main diseases for each year of the last decade as well as the death rates for each sex for the Province and Natural Divisions

Subsidiary Table XI gives the age distribution of 100,000 of each sex of main religions by annual periods.

Subsidiary Table XII gives the ratio of the number of males females and persons per 100,000 at the census of 1921 to those of the census of 1931, for each year of age, as recorded in the census schedules

Subsidiary Table XIII shows the annual number of births and deaths since 1881 in the Punjab (British Territory) It also gives the excess of births over deaths for each year as well as the ratio of female births and deaths to male births and deaths, respectively

Introductory

78 Of all the statistics collected at a census those pertaining to age are rightly regarded as among the most important A competent authority* has remarked that the results of a census operation alone are able to provide precise notions both of the numbers of the people and of various important elements characteristic of the life of a nation—data indispensable to all sound investigations designed to measure or trace the trend and tendencies contributing to national progress or decay, or to determine the effects or defects following the application of this or that administrative measure To no other individual item of the census enquiry are these remarks more applicable than to the statistics about age

Unfortunately however the return of age is probably the most notoriously incorrect of all census returns This is not only the case with regard to the age returns in this country, but even the census of a country like England and Wales is not free from errors in this respect †

The majority of errors in age returns are fortunately capable of being corrected, and as errors of practically similar types have been present in the past, the tabulated figures are not valueless for purposes of comparison Before explaining the means by which these errors have been eliminated at this census we will point out what the nature of these errors is The errors are either deliberate or unintentional In the former case they are due to mis-statement of age, such as under-statement on the part of unmarried females or elderly bachelors or widowers The well-known deficiency in this country in the number of females in the age-group, 15—20, is due to this cause Unintentional errors are due to looseness of expression, being confined mostly to preference for certain even numbers or numbers ending in zero or five They are also very often

* Edge Vital Record in the Tropics, page 12

† General Report on the Census of England and Wales, 1921, page 63

due to ignorance as illustrated by the following event. After a brief visit to Chamba in connection with the census work I was riding back to Dalhousie accompanied by a syce belonging to a village near Chamba. While answering my questions about tribes inhabiting the high mountains in the State the syce seemed quite intelligent, but when I suddenly questioned him about his age which was at least 25 he astonished me by stating it as 6 or 7

Now we can turn to the measures adopted to overcome these errors. Most of the unintentional errors, especially those due to partiality for certain even numbers, are cured if the age figures are grouped into quinquennial periods. This was the method adopted at all past censuses in the country and had the additional advantage of reducing the number of groups for closer study

All the local errors due to preference of numbers are not, however removed by a mere grouping into quinquennial groups, and the enormous number of persons returning their ages in multiples of tens or fives gives to the age distribution a very erratic appearance

Peculiarities of Age Returns.

79 In Subsidiary Table XI are given the numbers of persons out of a total of 100 000 returning each individual year of age. The areas from which these figures have been obtained were selected with a view to have an age distribution least affected by migration, and the totals were reduced to 100 000 for each sex and main religion. An abstract from it is given in the marginal table by way of illustration to show the extent of preference or plumping on certain figures. The table indicates that out of 100 000 persons living in a particular area, 3 490 returned their age as 50 and only 178 as 49 and 140 as 51 This could not possibly have been in accordance with the facts The enormous disparity between these figures is self-evident being due to errors described as unintentional. It will certainly improve matters if we were to show together the total number of persons for the five years 50 to 54 as in this way we will spread out the mis-statement a little more evenly This has been the practice as pointed out before at the past censuses but at this census we have adopted even a better method as will be presently explained.

Age (according to correct birthday).	Number according to actual age-return per 100,000.
47	166
48	299
49	178
50	3 490

53	125
54	191
55	1,459

Smoothing of Figures.

80 The age figures compiled at a census are sent to the Government Actuary for an expert report on (a) the real age distribution, (b) the rates of mortality deducible from these after comparison with age distribution at past censuses and (c) the average expectation of life. Before any examination of age returns could be undertaken by the Actuary attempts had always to be made to remove the errors due to plumping and these consisted of the application of mathematical formulæ which had the effect of transferring to the preceding age-group one-half of the excess at ages which are multiples of five over and above the mean value of the number at the preceding and following ages. To take an instance the late Sir George Hardy in his Report on the 1901 Census took the mean of numbers returned for instance at ages 49 and 51 added them to the number returned at ages 50 and then transferred half of this number into the age-period 45—50 and the other half into the age-period 50—55 This method was also the one adopted by Mr Ackland in 1911 but Mr Meikle who analysed the age figures in 1921 considered that the transfer should be larger Conse-

Meikle Report on the Age Statistics and Rates of Mortality, page 1.

quently, at the present census all the census age returns over four were not sorted direct into quinary groups, but sorted into ternary and septenary groups, such as 1—6 7—13 14—16 17—53, 54—56 67—73, and 74 and over The quinquennial age groups shown in final tables were obtained after 'smoothing' thus the age group 15—50 for instance was formed by a transfer of ⅓ of the number sorted into age group 17—53 and ⅓ of those sorted into age group 14—16 The ages below 1 were sorted into 0 (denoting an age of less than six months) and 1 2 and 3 years and separately shown into final tables as 0—1 formed out of all returns for age 0 and one-half of those shown as aged 1 and in the same way were obtained those in groups 1 2 and 2—3 The directly sorted age group 4—6 was split up in three parts ⅔ of it with ⅓ of those returned as aged 3 forming the age group 3—4 ⅓ of it forming those aged 4—5 and ⅓ forming with one half of group 7—13 the smoothed age-group 5—10 To illustrate this process a facsimile of the sorter's ticket is reproduced below

That this smoothing eliminates most of the defects of plumping will be apparent from the diagram given in the margin, which shows the distribution of 10 000 of the total population of each sex by age-periods according to the 1921 and 1931 censuses. It will be seen that the 1931 curve is much smoother than the other which is full of sharp bends particularly at all age-groups ending in tens. The present curve for females, who are even more ignorant about age than males, and whose endeavour in most cases is to under-state it is a little less smooth than the male curve. The small number of persons returned at ages 15—20 is as usual more marked among females than males.

Different Methods of Recording Age

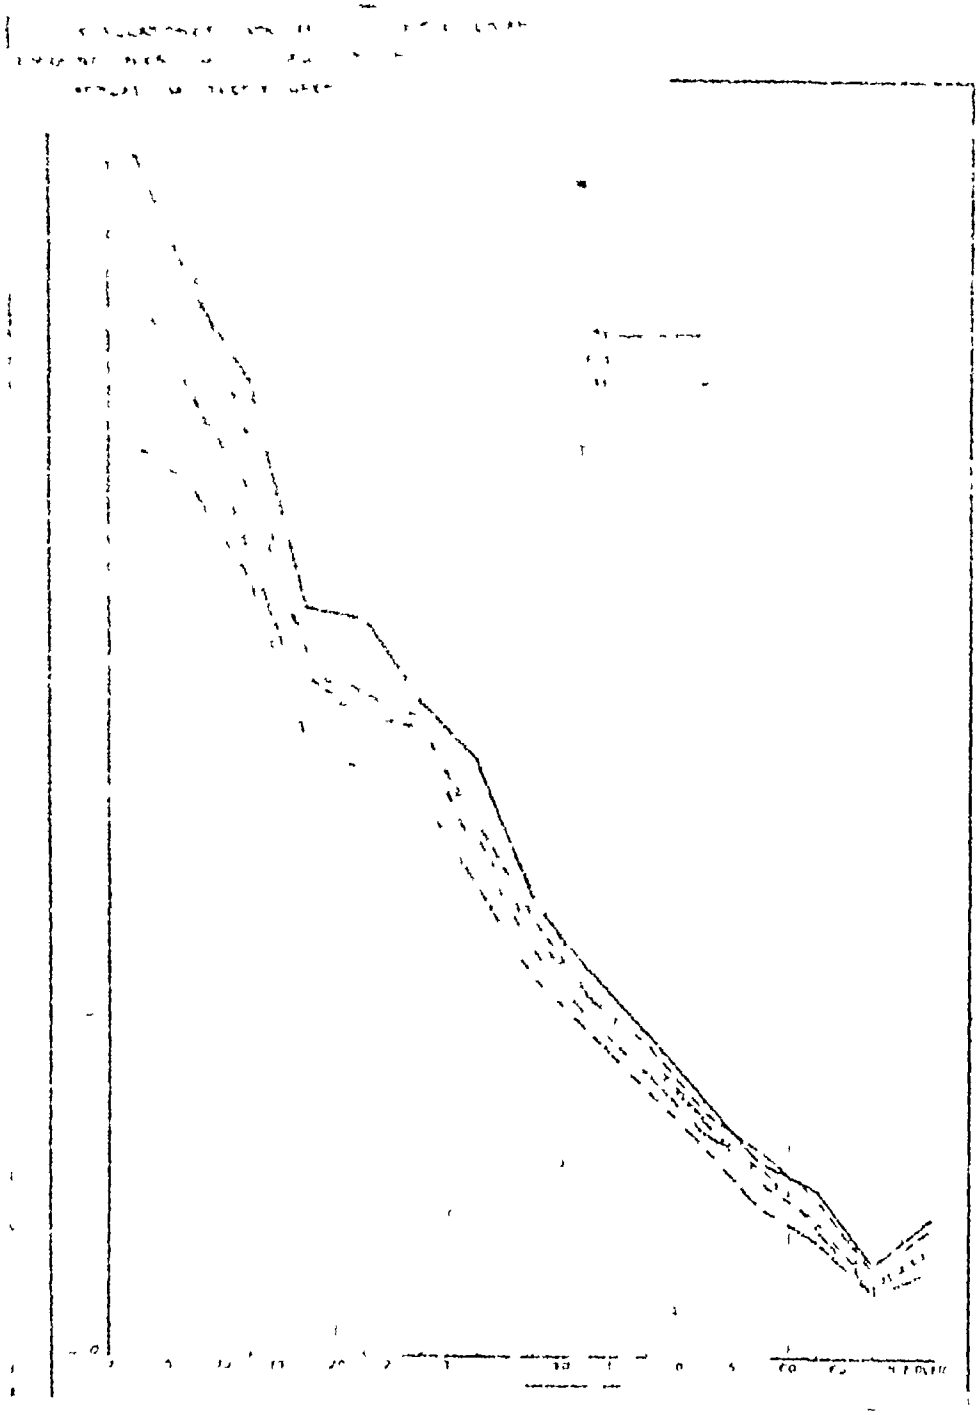

81 In another respect too the age returns at this census differ from those obtained at previous censuses. In all the Indian Provinces age was recorded in the past according to the number of years completed The exception was the 1891 census of this Province when instructions were issued to the enumerators requiring that age should be recorded according to next birthday At the time of abstraction, however the ages returned were reduced by one year with a view to obtain a uniform procedure for the whole of India. This was really not necessary because there was the usual plumping on certain ages and the persons enumerated as well as the enumerators hardly paid any heed to the new instruction and ages were in all probability returned as before To counteract this tendency which was recognised by the Actuaries to be due to a tendency on the part of the public to return age according to the nearest birthday the Actuaries had always to make due allowance in their computations Mr Meikle in his report on the 1921 figures laid particular stress on its recognition. The new instructions issued with a view to meet the situation and to secure some measure of uniformity required age to be recorded according to the nearest birthday six months or more counted as a year and less than six months was to be omitted Thus at last census if a person was 20 years and 11 months old his age would be recorded as 20 years whereas at this census a person who had completed 20 years and 6 months on the final census night was put down as 21 In 1921 the age of infants less than a year old was to be recorded as zero while at this census infants who had completed 6 months on the census night went in as one year in the column of age the age of only those below 6 months being recorded as zero.

Age Distribution of Different Communities

82. As already mentioned certain age statistics of the Province along with some other data such as figures of migration, have been supplied to the Government Actuary whose expert report is not likely to be available for a considerable time to come In the remarks that follow it is not intended to

anticipate his conclusions but an attempt will be made to arouse the reader's interest in the study of the subject

It has been remarked above that the smoothing of figures at this census was aimed at removing some of the defects, caused by plumping, so that we are in a position to compare the age distribution of the population at this census with the actuarial age distribution of the population for past censuses The diagram below shows the age distribution according to actuarial estimate for the last five censuses for the male population of Hindus and Muslims only The unbroken line gives the present age distribution according to the new method of compilation It will be seen that the curves give remarkably similar results and indicate that the age distribution of the population here depicted is very nearly in accordance with the probable age distribution

Age distribution for the last six censuses (actual smoothed figures in thousands)

Variation in individual Age-groups.

83. As alluded to in paragraph 48 of Section 6 of the first Chapter the number of persons aged 60 and over at this census is 14·2 per cent. smaller than the corresponding figure appearing in the Imperial Table of 1921. The reason there assigned to this deficit was the difference in the method of tabulation, adopted on the present occasion. The deficit is further explained in the remarks that follow. We had better not keep to the number of persons aged 60 and over as this age falls in the middle of our crude septenary group and the redistribution of persons for each individual year might make the results too arithmetical. As we are only aiming at the removal of the suspicion that persons of advanced ages have been tragically reduced for some reason or other persons aged 63 and over will do as well.

If we take the number of persons at the present census at each age-period by the sorting of actual age returns into groups as done at the last census, we find that there is no real decrease in the number of persons at older ages as at first sight appears from a comparison of the smoothed figures in our Imperial Tables with the unsmoothed figures of 1921. As pointed out already the actual ages returned at this census were sorted into ternary and septenary groups, such as 57—63, 64—66, 67—73, 74 and over before being smoothed to give the quinquennial age-periods. The figures at the last census were sorted direct into quinquennial age-periods such as 60—64, 65—69, 70 and over. Now if all ages sorted direct at this census into groups 64—66 and onwards are grouped together we could compare them to the persons returned in the corresponding groups of 1921 namely 65—69 and onwards. An allowance will have to be made in our figures for persons who returned their age as 64 as these are to be excluded. We have already remarked in paragraph 81 above that any change in instructions with regard to the return of age last birthday or next birthday makes no appreciable difference in the actual returns, the ages being according to nearest birthday in so far as the people are capable of returning them intelligently. From Subsidiary Table XI we get 63 as the number of persons who returned their age as 64 out of 100 000 of actual returns. Assuming that the same proportion of the total population returned this age we find that the total number of persons returning 64 as their age at this census is about 18 000. Subtracting this from the number of persons aged 64 and over as obtained by direct sorting we get 9,50 000 persons aged 65 and over as compared to about 830 000 at the last census. It is thus evident that there is an actual increase in this census the percentage of rise being 13·6 or almost exactly though quite accidentally the same as in the total population of the Province. If for the sake of argument the transfer for the age 64 were to be doubled the percentage of increase would be only reduced to 11·5. The number however in both cases is unreal as it contains the effect of unintentional errors and anything like normal age distribution is the one now obtained by the smoothing of the figures. The curves on page 129 are the nearest approach to normal distribution, which can be obtained with the material available. This diagram shows that the number of persons of all ages over 60 is greater at this census than the real number which according to the Actuary was living at these ages in 1921.

The real yet another way of looking at the figures of the aged. The person aged over 65 in 1931 are the survivors of those aged 55 and over in 1921. The figures of the latter according to the 1921 tables are not however smoothed and the effect of plumping at 55 which certainly includes some persons of lower ages has to be removed before any comparison could be made. It has also to be borne in mind that the present figures of those aged 65 and over have been

depleted by the return of age as 60 by some of those who are really older as this is the most preferential of all the old ages This preference on the other hand does not so much affect the number aged 55 and over in 1921 Coming to the figures themselves, we find that there were 2,133,171 persons aged 55 and over in 1921 (Table VII) According to a direct grouping of the 1921 crude age-returns in Subsidiary Table I to Chapter V, 1921, page 207, there would be 9,173 persons aged 55 and over out of every 100,000 If these crude figures are first grouped into triennial and-septennial groups and then smoothed according to the process adopted at this census, there would be 8,416 persons aged 55 and over, giving a ratio of 91 100 between the smoothed and unsmoothed figures That this ratio is the correct one to apply before obtaining comparable figures is borne out by the crude age distribution (Subsidiary Table VI at the end of this Chapter) obtained at this census, which gives the same result when the present figures are similarly treated Graduating the population aged 55 and over in 1921 by the application of this ratio we find that it comes to 1,941,185 As against this we have 832 998 persons aged 65 and over at this census according to our Table VII, or in other words there has been a decrease of 57 per cent among the aged in ten years This percentage will be slightly reduced if the exclusion of a certain number from the population now aged over 65 were to be allowed for on account of preference for the age 60 An ever diminishing number of people from amongst those aged 55 and over in 1921 was below the age of 60 in the first quinquennium of the last decade, and a reduction of about 57 per cent among the aged, in ten years is fully justified by the average annual death-rate of the last decade among persons over 60, which comes to 63 *per mille* annually or 63 per cent in ten years There has been actually a reduction in this death-rate, which is shown by a comparison with the average death-rate that prevailed in the previous decade, which was 79 *per mille* among males and 84 *per mille* among females (*vide* Subsidiary Table IX on page 220 of the Punjab Census Report, 1921) The net result is that the aged have not suffered unduly during the last decade If the method of smoothing adopted on the present occasion is adhered to in the future, comparisons will become easier and much more valuable It will serve no useful purpose to compare the figures of other age-groups

Age Distribution Compared to Other Countries

84 Nothing will bring out more clearly the characteristics of the age distribution of the population of this Province than its comparison with the age distribution of some of the Western countries In the marginal table the proportional age distribution in 1921 for England and Wales and France are compared with those of this Province It is apparent that in the Punjab the number of both sexes in the early age-periods is comparatively enormous, the number of older persons being very small It is perhaps hardly necessary to add that a large number of persons in any age-period automatically reduces the proportion of persons at other ages

Number per 1,000 of both sexes of all ages

Age period	Punjab		England and Wales 1921		France 1921	
	Males	Females	Males	Females	Males	Females

60 and over	29	21	42	53	61	76

From what has been remarked above it can reasonably be concluded that the expectation of life in the Punjab is much smaller than in European countries The Actuarial Report will deal with this question at a greater length

and determine the mean of expectation of life for persons at various ages, but the fact is too patent not to be noticed.

Other Provinces.

The age distribution of this Province is compared in the marginal table with that obtaining in some of the other provinces. The Punjab has the highest proportion of children as well as old persons except that females in Madras seem to be longer lived. The proportion of people in middle life is therefore naturally smaller in this Province than in others.

Number per 1,000 of each sex.

Mean Age.

85 Having seen the proportions of persons at different ages and drawn the rather serious inference about the expectation of life, we are led naturally to a study of the "mean age" by which is meant the age for a particular community or area the number of persons below and above which is equal. This discussion has mainly an academic interest. A community with a comparatively large proportion of children will have a low mean age while a regressive population though not actually longer-lived will have a comparatively higher mean age. The determination of the mean age is however not altogether valueless as it furnishes a basis of comparison with the figures of the past and gives an indication of the various forces operating on human life. The table in the margin shows the mean age of the population by main religions and sex for all censuses since 1881. It will be seen that during the last fifty years the mean age has varied by no more than two years in a great majority of cases. The smallest figures are those for the year 1891 and the reason for this, as given in the 1911 Report (page 203), was that the preceding decade was characterised by a great rise in the birth rate. This undoubtedly accounts for a part of the variation but the real cause as referred to above was the reduction, during compilation by one year of the ages of all individuals returned at the census of 1891 in order to obtain the figures according to the years of age completed. The mean age during the period, 1901—1921 seems to have increased slightly in the case of males and decreased in the case of females. The reason seems to have been the comparative impunity of males in middle and older ages from the ravages of plague and influenza which are known to have caused heavy mortality among female adults. As compared with 1921 the mean age at this census has dropped by nearly one year in the case of males and a little more in the case of females on account of the great increase in the number of persons at earlier age-periods. The mean age would have been even lower if age had been recorded, as in 1921 according to the number of years completed.

*The mean age has been calculated by the method described in India Administrative Report of the 1901 Census page 291.

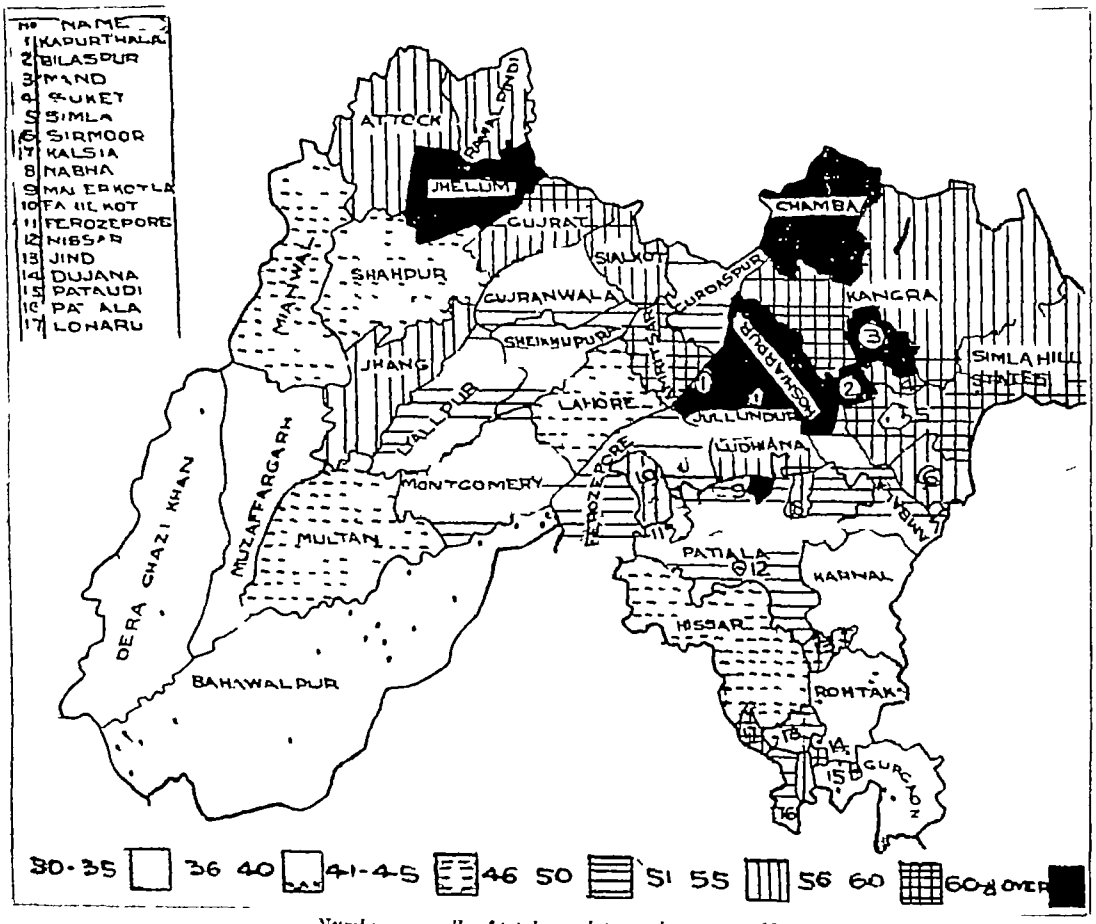

Mean Age in Natural Divisions

86 It will be of some interest to make a study of the mean age by Natural Divisions Though it does not necessarily indicate longevity, it certainly furnishes a well-known basis for comparing the age distribution From the table in the margin we see that the mean age is highest in the Himalayan Natural Division where the proportion of children is smallest, the Sub-Himalayan and the Indo-Gangetic Plain coming next in order The mean age for the North-West Dry Area with a large amount of adult migration is curiously small This is undoubtedly due to the great natural increase noticeable in the colonies where settlers have made permanent homes The subject is further discussed in the next paragraph as well as in Chapter VI under the heading "Comparative fertility in different areas '

Natural Division	Mean age
Punjab	23 7
Indo-Gangetic Plain West	23 8
Himalayan	25 6
Sub Himalayan	24 3
North West Dry Area	23 0

Longevity in Different Areas

87 Generally speaking an area with the greatest proportion of persons over 60 may be regarded as most suited to longevity It has already been pointed out that the age distribution is greatly affected by various considerations, such as large natural increase in particular areas and migration . The map below shows the number of persons per 1,000 of the total population of each district or state, who are over 60

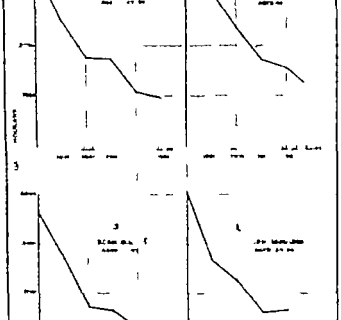

Number per mille of total population who are over 60

The Districts of Karnal and Muzaffargarh, which as noticed in Chapter I have the smallest natural increase and which in consequence should have shown a larger proportion at other ages, possess the smallest proportion of persons over 60 The two districts may therefore be regarded as being most inimical to

longevity and very unhealthy The proportion of older people is low all over the North-West Dry Area partly because of the presence of a large number of middle-aged people as a result of migration or of children owing to larger natural increase The true state of affairs about the comparative healthiness or otherwise of these areas will be known after a few more years when the conditions in the colonies will have settled down. The areas with the largest proportion of the older persons are the cooler Himalayan Division and the sub-montane districts of Hoshiarpur and Jhelum. The proportion of older people in Jullundur and Kapurthala is also fairly high, being partly attributable to the large number of young and middle-aged emigrants from these places The same remarks apply to Sialkot, Gurdaspur and Ludhiana.

Quinquennial Births and Age-groups.

88 We might now study the age distribution with the help of vital statistics Such a study is likely to throw light on the nature and extent of mis-statement of age both in the census and in the record of births and deaths, and will also give an indication of the ages, at which the death-rate is comparatively high or at which mis-statement is particularly great The marginal table appearing below gives for each quinquennium the number of births recorded in the British Territory and the number of persons returned at corresponding age-periods at this census It is evident that the latter represent the survivors of persons born in the quinquennium shown opposite them. To bring out the results more clearly the life history of persons born in each quinquennium during the period 1881—1885 to 1896—1900 has been traced in the diagram above The survivors of the persons born during the quinquennia 1881—1885, 1886—1890 1891—1895, 1896—1900 are now aged 45—50 40—45 35—40 and 30— respectively The various degrees of mortality at different ages are evident from the four

Survivorship of persons born in each quinquennium during the period 1881—85 to 1896—1900

1 1 15	4,21 1	15—[illegible] 20	[illegible] 37
1 1	[illegible] [illegible]	[illegible]—5	2 1 1,921
1 1—05	1,32[illegible] 1	5—[illegible]	1,90 [illegible] 7
1 [illegible] 1 05	6,[illegible]2,[illegible]	25—30	1,[illegible] [illegible]77
1 —95	3 1,2	[illegible]	1,[illegible] 31
1 [illegible] 90	[illegible]	[illegible]	1,31 [illegible]
1 1—	3 [illegible]	35—40	[illegible] [illegible]

curves and the number at earliest ages falls rapidly The mis-statement of ages round about 15—20 is also clearly brought out as the drop does not exist in graphs Nos 2 and 4 when the population at 10—15 at one census is traceable to the one aged 20—25 at the next, the age-period 15—20 being thus skipped over The comparative stability of figures from 25 to 35 is due to these ages being comparatively less exposed periods of life If the Province did not lose through emigration, the persons between these ages would be found to be still more numerous

Census as a Test of Vital Record

89 Having compared generally the figures of birth and quinquennial age-groups of the census, we might attempt to deduce the death-rates from the census population The present census population aged ten years and over are the survivors of the total population of 1921, the difference between the two being the total number of deaths during the decade among the population 5 years and over This assumption is the same as that adopted by the late Sir George Hardy in his Actuarial Report of 1901, and gives a death-rate for the last decade of 30 7 *per mille* on the mean population of the two censuses The corresponding death-rate, worked out from the figures of the Public Health Department, is 30 4 *per mille*, a figure sufficiently close to the one calculated above to establish the comparative accuracy of both

After we have determined the death-rate and with its help the amount of omission in the record, we can find out the number of births with the aid of actual increase in the population, which is known to us The birth-rate thus obtained is 43 9 *per mille* of the mean population The average birth-rate for the same period, calculated from the annual rates published by the Public Health Department, comes to 42 2 *per mille* The difference between the calculated and the published death and birth rates is 3 and 1 7, respectively, which bears out the view that the registration of births and deaths has steadily improved and is reliable enough, and that the record of births is comparatively less accurate than that of deaths

Effect of Migration on Age Distribution

90 In the preceding paragraphs we have discussed the various aspects of the age distribution without mentioning the effect of migration on the figures We were constrained to do so as the figures of migrants by age are not available Fortunately on account of its small magnitude the effect of migration on the figures of total population is negligible The influence of immigration on age distribution in smaller areas is to increase the number in middle age-periods The converse should hold good for localities, of which the population is depleted as a result of emigration For example, the age distribution of a big city like Lahore and some districts, such as Montgomery and Multan, ought to show the former characteristics, while the population of districts like Sialkot and Jullundur should furnish the latter peculiarity The table in the margin gives the age distribution of 1,000 of both sexes for Lahore City and the districts named above Confining our attention in the first instance to figures of persons aged 15—40, we find the largest proportion in Lahore City where the characteristic sex ratio is also clearly brought out The number of persons aged 15—40 is higher both in Montgomery

Age	Lahore City		Montgomery District		Multan District		Sialkot District.		Jullundur District	
	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females

and Multan than in Sialkot and Jullundur and this in spite of there being a large number of children in the former two districts The too old stick to their homes and predominate in their own districts.

Age Distribution by Caste

91 We may now examine the age distribution among certain castes and see how far the differences in social position are reflected therein. The table below shows the figures for certain castes grouped as Intellectual, Agricultural and Depressed The figures of criminal tribes are also separately given. Examining the figures of various castes in some detail, we find that the intellectual *Brahmans* has the largest number of person at ages over 44 and least in the youngest ages. In other words his age distribution is nearest to the one obtaining in Western countries. The *Harni* has the largest proportion of children and the *Bawaria* and the *Sansi* are not far behind in this respect. A possible conclusion is that the Indian aborigines are not a dying race as they are sometimes supposed to be As a matter of fact the age distribution in the case of criminal tribes is affected by their returning wrong age and also by a possible attempt to conceal the caste on the part of many adults who when absent from their homes are anxious to hide their identity as members of a criminal tribe

NOTE.—This table is prepared by sorting actual samples the numbers actually sorted are —

Males —Hindu 51 200 from the Western and 74,015 from the Eastern Punjab
Sikh 113 996 from the Central Punjab
Muslim 67 229 from the Western and 50,061 from the Eastern Punjab
Females.—Hindu 49 771 from the Western and 63,245 from the Eastern Punjab
Sikh 95 312 from the Central Punjab
Muslim 56,745 from the Western and 45,100 from the Eastern Punjab

SUBSIDIARY TABLE XII

The ratio of the number of males, females and persons per 100,000 at the census of 1921 to those of the census of 1931, for each year of age, as recorded in the census schedules

CHAPTER V.

SEX

92 Proportion of the sexes 93 Sex at birth 94 Masculinity at birth 95 Female infanticide 96 Neglect of females 97 Recorded male and female death rates 98 Sex proportion in Natural Population 99 Comparison with other provinces and countries 100 Sex proportion in different localities 101 Sex proportion in smaller units 102 Sex proportion by religion and localities 103 Sex proportion by caste

Reference to Statistics.

All the Imperial Tables give the detail of absolute figures for each sex separately

Subsidiary Table I gives the general proportion of the sexes by Natural Divisions, districts and states, both for the actual and Natural Population for the previous five censuses and proportional figures for actual population for the present census The sex proportion for Natural Population in 1931 by Natural Divisions and other smaller units is not available, and only the proportion for the whole Province has been given

Subsidiary Table II gives the number of females per 1 000 males for different age periods by religion at each of the last three censuses for the whole Province

Subsidiary Table III gives the same information as Table II for each Natural Division

Subsidiary Table IV gives the number of females per 1,000 males in certain selected castes at different age-periods, the names of the castes under each main religion being entered in alphabetical order

Subsidiary Table V gives the number of births and deaths reported for each sex during each year since 1901 for British Territory only and also contains the ratio of female to male births as well as the proportion of female to male deaths for the same period

Subsidiary Table VI gives the number of deaths for each sex at different ages, for each year of the decade, 1921—30 together with the average number of female deaths per 1,000 male deaths

Subsidiary Table VII* gives the yearly number of births and deaths in the British Territory by sex for Hindus, Muslims and Indian Christians separately, the term Hindu including Sikhs Jains, Ad Dharmis and Buddhists

Subsidiary Table VIII gives the proportion of females per 1 000 males for each tahsil and state for the census of 1931

Proportion of the Sexes

92 In its total population the Punjab has a particularly small proportion of women, there being 2,631,531 more males than females This peculiar characteristic has given rise to a variety of opinions and some foreign critics of the Indian census have ascribed it to the incompleteness of returns This charge has been refuted on several occasions, but if any fresh proof was needed it is furnished by the 1931 census of this Province which discloses no marked variation in the sex proportion in spite of a record intercensal increase in the population of both sexes

In the margin is given the sex proportion, or the number of females per 1,000 males, enumerated at each census since 1881 for the whole Province and its two main political divisions The sex proportion at a still earlier census, namely that of 1868, was 835 females per 1,000 males or a little higher than it is at present The proportion of females rose steadily between 1881 and 1901, but fell considerably in 1911 due to the ravages of plague, which were particularly fatal to persons leading an in-door life The proportion improved slightly in 1921 in spite of the influenza epidemic, which also took a heavier toll of female lives The proportion at the present census shows a slight increase, more marked in Punjab States than in British Territory

Locality	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Punjab	844	851	854	817	828	831
British Territory	848	855	858	818	830	831
Punjab States	828	834	836	814	820	832

In the census reports of the past the disparity of the sexes has been ascribed to female infanticide, the neglect of female children in earlier ages, the high rate of mortality due to child bearing, and the neglect of females of advanced

*New table added

ages. Admitting for the moment the effectiveness of all these contributory causes, insufficient attention in the past seems to have been paid to the cause beyond the control of man, namely the disparity in the numbers of female and male children born. According to the record of births, about half a million less girls than boys were born during the last decade in the area under registration, and yet both the sexes were able to maintain the old proportions.

Sex at Birth.

93 The determination of sex at conception, undoubtedly governed by some law of nature is one of those phenomena that have not been completely understood or explained. Some theories have been advanced about the males preponderating in births during periods following famines or war and the females during periods of prosperity or comparative freedom from disease. Though with the present material at our disposal very definite conclusions cannot be drawn yet it will be of interest to examine the conditions over a long period to see if they admit of any explanation. In the marginal table the figures of recorded births are given by sex for the whole period, for which statistics are available the number of female births per 1 000 male births being also shown. From these figures it would appear that from 1881 to 1900 the proportion of female children born was on the increase, and this period as we know was for the most part comparatively free from disease. But when we come to the period 1901 to 1921 we find that the proportion was high and low in the alternate quinquennia. It was high in the comparatively healthy quinquennium of 1901—1905 but fell during the next, which included 1907 the worst year of plague. The proportion of female births again rose in the comparatively prosperous period of 1911—1915 and declined during the next quinquennium, which witnessed the influenza epidemic of 1918. When we come to the last decade we find that the proportion of female birth drops even lower than any figures since 1891. This decrease in the proportion of female births requires some explanation. Is it due to any increase in female infanticide or any faulty registration? The former factor will be examined briefly in the next paragraph and as regards the system of registration it has if anything improved of late years particularly in rural areas. What then is the reason for the decline in the proportion of female children at birth in this Province? Is not this the result of some law of nature which in order to prevent too rapid a growth of the population of this Province has reduced the number of females? Is not this check of nature a warning that the Province is becoming over populated or at least there is a danger of its becoming so in the near future? The check of nature on the population of this country is not a thing unknown. Formerly it used to operate in the form of famines or epidemics, but since man has to a great extent subdued both of these agents by his engineering or medical skill the check seem to have become operative in another direction.

Year.	Recorded Births.		Number of females per 1,000 males.
	Males.	Females.	
1	2	3	4
1881—1885.	1,962,661	1,760,257	878
1886—1890.	1,967,892	1,777,762	884
1891—1895.	1,854,903	1,726,778	894
1896—1900.	2,114,491	1,822,037	914
1901—1905.	2,192,231	1,991,077	90
1906—1910.	2,145,044	1,914,966	891
1911—1915.	2,318,349	2,116,493	913
1916—1920.	2,229,597	2,046,481	918
1921—1925.	2,319,471	1,974,196	852
1926—1930.	2,261,149	2,170,126	961

Area under registration includes all the Punjab districts existing the cantonments and Lahore Transfer as Trans of the Lyallpur Khan District

our conclusions on them. We find that in urban areas proportionately more females are born than in rural areas. The urban areas being more prosperous than the rural, it might be safe to deduce that prosperity results in more female births and poverty in more male births, and perhaps the law of nature requires that the families with a smaller income and engaged in occupations of a more strenuous type should have a larger number of earners.

Female Infanticide.

93. It was remarked by my predecessor of the 1911 census that female infanticide which evidently prevailed to a considerable extent at the time of annexation of this Province has dwindled down to insignificance that wherever it now exists it is confined to individual families, or groups of families and that its extent is not sufficient to influence the proportion of sexes in any particular caste or locality as a whole much less, that of any caste or religion in the whole Province. *

The subject was dealt with in a note at the end of Chapter VI of the 1911 Report and the main conclusion arrived at has been cited above Undoubtedly the conditions have further improved since 1911 as is evidenced by the figures in the margin which show the proportion of Sikh-Jat females of all ages to 1 000 males in the four districts where the sinister practice was believed to be most prevalent. The figures of Hindu Rajputs of Kangra have also improved from 947 in 1911 to 938 in 1921 and 932 in 1931 The reason for the drop in the 1931 figures, as compared to those of 1921 has already been hinted at more than once namely the return home of numerous males employed formerly in the Army

District	Number of Females to 1,000 Males among Sikh-Jats.		
	1911	1921	1931
Lahore	661	714	780
Ferozepore	744	787	794
Jullundur	666	685	719
Ludhiana	707	724	747

The record of births does not give separately the figures for Hindus and Sikhs nd therefore no evidence about the existence of the practice can be adduced from that record I however got hold of the enumeration books of certain Sikh villages in the Districts of Ludhiana and Ferozepore, notorious in the past for the prevalence of female infanticide and I give in the margin the figures of Sikh girl aged under 10 and of married females aged 15—40 enumerated in those villages. The proportions thus indicated are not much at variance with those of tamin, in other places, the ratio of such female children to married females aged 15—40 for the whole Province being 8 per cent.

Village	Married females aged 15—40	Girls aged 0—10	Number of girls per 100 married females.
1	2	3	4
(Ludhiana District).			
1. Gid	2 1	211	75

7. Chak Kala	6	4	67
8. Dharma	102	4	47

* Punjab Census Report, I. II, para 720

The number of females per 1,000 males in these villages is compared in the marginal table with the corresponding figures for 1911, and an all-round improvement is noticeable, the existing larger number of women being partly due to casual migration of women from other places most of whom have been taken in marriage by the male residents of those villages

Village	Number of Sikh Jat Females per 1,000 Males	
	1911	1931
1	2	3
(Ludhiana District)		
1 Gil	571	799
2 Gujjarwal	770	908

Lahore	883	882	1,021	909	854

Neglect of Females.

96. The question of neglect of females would be best studied by a comparison of the number of females with the number of males at given ages. The figures of age as was pointed out in the last Chapter are, however full of serious errors due to mis-statement. In the same Chapter was also explained the attempt made as well as the measure of success attained at this census to free the figures as far as possible from those errors. The errors still existing is probably in ages 15—20 or thereabouts, which generally contain the greatest amount of mis-statement. The proportion of females per 1 000 males at different ages is given in the table in the margin and the graph below it illustrates the same a curve therein showing the proportion in accordance with the recorded statistics of birth. By a glance at these proportions we find that the females aged 0—5 compared to males of the same age are as 930 1,000 Thus the proportion is higher than the proportion at birth, which as we noticed was 894 per thousand This variation in the proportion signifies one of the two things, ra..., either the record of female births is more defective than that of males or that males die at a greater rate than females up to the age of 5 Though there would seem to be some defect in the recording of female birth the high death-rate among males below 5 is borne out by the death-rates, published by the Public Health Department and reproduced in Subsidiary Table IX to Chapter IV

Number of female per mille of males at different age together with proportion between recorded births of both sexes

The proportion in the next quinquennial age-period drops to 859 per 1 000 males as again t 89 per 1,000 the ratio at the tim of the birth of these girls. It would thus appear that in ages 5—10 girl die at a greater rat than boys Thi fact is also borne out by the publi hed death rates. Female children uffered particularly more than male children during th plagu epidemic of 19 1 and the general death rat i also higher among gul mainly because they tay at home while their brothers pend much time out-doors.

Th pr portion of fem les at ages 10—15 is 814 per 1 000 males a opposed to 9 for these girl at the time of birth The proportion at this quinquennium is even lower than that for the last quinquennium, being partly due to the return

of age as 10 or 12 in cases where the girl is unmarried and its jumping to 20 or so if she is married and especially if she has got a baby or two Small as the proportion in this age-group is it is higher than the proportion for the corresponding age-period at last census, which was only 750 The age figures then were unsmoothed and the plumping at 15 went into the next higher age-group

The next age-group of 15—20 is the one in which the great majority of girls get married (as we shall see in the next Chapter), and during which the mortality due to early child-bearing is considerable The proportion of females to 1,000 males in this age-period is no more than 820 as against 913 at birth This, however, is a little higher than the proportion at ages 10—15, and as already explained is mainly due to the return of ages as 20 or so on the part of young mothers, some of whom as a matter of fact belong to the earlier age-period This plumping is so much in evidence that it seems even to wipe out the effect of higher death-rate due to child-birth The female death-rate for this age-period is about 4 *per mille* higher than that of males as shown in the Subsidiary Table referred to above

The proportion in ages 20—25 is greater than for ages 15—20, being 848, and seems in this as well as all the succeeding age-periods to be affected by migration There is an excess of female immigration over emigration, though for both the sexes taken together the result is quite the other way (as noticed in Chapter III) To take the actual figures there were 273,982 Punjab-born women, enumerated in the other provinces or states of India, while 319,544 born in other provinces or states were enumerated in this Province The bulk of this migration is, as observed in Chapter III, of the casual type, and the majority of the women concerned would naturally be 20 or above This leads us to the question of the proportion of the sexes in the purely province-born, or in other words the "Natural Population" of the Province We shall deal with this subject in a subsequent paragraph, confining our attention for the present to the study of the sex proportion in higher ages

In the remaining age-periods the proportion of females to 1,000 males goes on decreasing with the exception of the periods, 40—45 and 70 and over, though even in these it does not approach anything like the figures of the proportion at birth or during youth The reason for this variation seems to be the comparatively large number of women returning ages 40—45 as a final effort to appear young The reason for the large number returned at older ages (70 and over) is the over statement of age to hide premature senility or to claim the respect due to old age This latter tendency would automatically operate to reduce the number and consequently the proportion in ages immediately preceding the age-group 70 and over The sudden drop in the proportion at ages 30—35 is due to the popularity of these ages among males and not particularly to any increase in female mortality

Thus we find that with the exception of certain age-groups, pointed out above, the proportion of females goes on decreasing till it becomes markedly lower than the proportion at birth The deaths among males continue at different ages and at different rates, and the reduction in the proportion noticeable among females is attributable to varying rates of mortality among them at different periods of life due more or less to causes peculiar to their sex

Recorded Male and Female Death rates.

97 The number of deaths by sex and age for the last ten years are given in Subsidiary Table IX at the end of Chapter IV If we calculate the rate of death for both sexes after equalizing their population we find that the average death-rates for males and females at different ages bear the ratios to each other shown in the marginal table. The population by age is taken from the figures in the 1921 tables. We find that comparatively fewer females than males die up to the age of 5 but from then onwards females die at a greater rate except in the case of those aged 50—60 when the proportion becomes equal. Comparatively the greatest mortality among females is found in the age-periods, 10—15 and 15—20 mainly because these comprise the periods of first confinements. There is thus nothing surprising about the result. The matter for surprise, however is that there should be such a large number of deaths among females aged 10—15 The only possible explanation is that in many cases girls below 15 begin to bear children and the rate of mortality among them due to this cause is enormous. Beyond this an opinion, based on these death rates, need not be hazarded as the ages, recorded at the time of death are probably full of errors and plumping to a greater extent than even our unsmoothed age returns. The recorder of deaths is not in the same position as the census enumerator to ascertain the correct age, much less to use his discretion in the matter and in fact his information is worse than second hand.

Age.	Female deaths per 1,000 male deaths.

40—50	1,048
50—60	1,000
60 and over	1,062

Sex Proportions in Natural Population.

98. In the last paragraph we referred to the sex proportion at ages 20—25 and subsequent age-periods as having been affected by immigration. The trend of the argument was that the higher proportion of females at these ages was due to the influx of females into the Province from outside. That a large number of females are brought to the Province by returning emigrants is well known and is traceable to a certain extent in the tables of "birth-place and mother tongue" though the persons concerned would naturally try to hide their identity by not disclosing their birth place and mother tongue if their presence in the locality is the result of shady transactions as is sometimes the case. Such immigration however is negligible when compared to the casual immigration from across the Jumna and the southern border adjoining Rajputana. We should thus expect to find a still smaller proportion of females in the Natural Population of the Punjab *i.e* when all foreign-born females are excluded than in its actual population and such in fact is the case. The proportion of females per 1 000 males in the Natural Population is 823 or 8 per thousand less than in the actual population.

Comparison with other Provinces and Countries.

99 After having referred to the sex proportion at birth and discussed its subsequent variation and the causes responsible therefor we can profitably turn to the sex proportion of certain Indian provinces and foreign countries. A more intimate knowledge of the conditions obtaining in some of these may

help the reader to form his own opinion as to the causes of the disparity The table in the margin compares the number of females per 1,000 males in this Province with the corresponding figures of certain other Indian provinces and some foreign countries It will be seen that of the major Indian provinces the Punjab has the smallest proportion of females The sex proportion in India seems to increase as we move to the east or to the south Perhaps the preponderance of males in the Punjab is due to its peculiar requirements, the land of five rivers not far removed from the Passes in the North-West being admittedly the gateway and sword-hand of India

Females per 1,000 Males

Province	1931	Foreign Countries (year of last census)	
1	2	3	
Punjab	831	England and Wales (1931)	1,087
N W F Province	843	France (1921)	1,083
United Provinces	906	Holland (1930)	1,012
Bihar and Orissa	1,008	Germany (1925)	1,067
Bengal	924	Japan (1930)	990
Burma	958	Turkey (1927)	1,079
Madras	1,025	United States of America (1930)	976
Bombay	909	Australia (1921)	967
Central Provinces	1,000		
Central India Agency	948		
Rajputana	908		

Turning to the figures of foreign countries we find a large excess of females over males in European countries We know that in these very countries the birth-rate has been declining of late There is also present a contributory cause in the form of male emigration

The number of females in Japan is fairly equal to males and the proportion would be lower and something akin to that obtaining in India, if all the Japanese males were to stay at home Japan has had a phenomenal rise in population in the last fifty years, and there is a great pressure of the population on its resources, resulting in the well-known efforts of the Japanese to found colonies in Manchuria The poorer countries with a large natural increase would thus appear to have a fewer number of females The sex proportion in countries such as the United States of America and Australia is, of course, greatly affected by the large amount of male immigration

Sex Proportion in Different Localities.

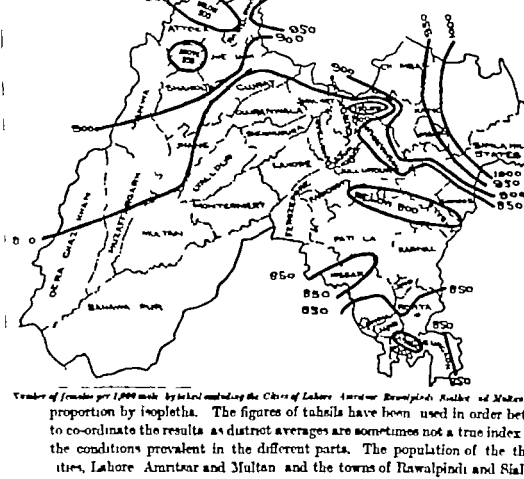

100 The proportion of the sexes is not uniform in the various parts of this Province, as is evidenced by the figures in the margin The proportion of women is highest in the cooler Himalayan Natural Division, where there is always the smallest natural increase It is smallest in the Indo-Gangetic Plain West, which has large urban areas, and if the population of the cities of Lahore and Amritsar and the towns of Jullundur, Ferozepore, Ludhiana and Gujranwala, all situated in this division, is excluded, the proportion in the remaining area will rise from 813 to 830 The proportion in the North-West Dry Area is surprisingly high for a tract, which has a great amount of immigration, indicating that the immigrants consist of fairly equal numbers of both sexes The fact that the female proportion in this tract has an upward tendency points to the permanent nature of the immigration This of course is natural as immigrants are for the most part agriculturists, who from the very nature of the industry must remain on the land, which they cultivate The proportion in the Sub-Himalayan Division is lower only than that in the Himalayan, but is no doubt affected to a certain extent by emigration which reduces the number of males

Females per 1,000 Males

Natural Division	1931	1921	1911
1	2	3	4
Punjab	*831*	*828*	*817*
Himalayan	906	907	901
Sub Himalayan	847	852	827
North West Dry Area	831	827	825
Indo Gangetic Plain West	813	805	795

Sex Proportion in Smaller Units.

101 The sex proportion for the districts and states is in keeping with the proportion obtaining in the Natural Divisions, in which they are situated though large urban areas irrespective of locality have the effect of reducing the proportion of females. The figures for each district and state are given in Subsidiary Table I at the end of this Chapter but a clear idea of the proportion of females may be obtained from the map below which shows the sex

Number of females per 1,000 male by tahsil excluding the Cities of Lahore Amritsar Rawalpindi Sialkot and Multan

proportion by isopleths. The figures of tahsils have been used in order bett r to co-ordinate the results as district averages are sometimes not a true index f the conditions prevalent in the different parts. The population of the three ities, Lahore Amritsar and Multan and the towns of Rawalpindi and Sialkot (including cantonments) has been excluded to remove the extreme effect of urbanization.

Sex Proportion by Religion and Locality.

102. The only matter now remaining for consideration is the proportion of sexes among different religions and castes or tribes. In the margin I rproduced the number of females per 1 000 males for main religions and Natural Divisions a

Natural Division.	Hindu		Muslim		Sik		Christian	
	1931	1921	1931	1921	1931	1921	1931	1921
1	2	3	4	5	6	7	8	9
Punjab	831	829	79	11	783	725	861	746
Indo-Gangetic Plain	818	809	825	827	780	735	14	796
Himalayan	917	913	1233	1231	1117	1081	1049	1111
Sub-Himalayan	872	871	893	898	864	791	765	76
North West Dry Area	813	801	854	845	792	741	804	766
British Territory	856	853	841	847	795	776	863	796
Punjab	841	847	878	871	776	749	799	857

well a British Territory and Punjab States for the ens uses of 1931 and 1921 The proportion of women among Muslims is th highest a it was in 1921 th ugh it ha decreased in all Natural Divi ion except the North West Dry Area Hindus follow next and their proportion has risen in all Natural Divi sion while Christian in spite of the comparatively larger number of European males come third Th Sikhs have the smallest number of females but their proportion is greater than in 1921 in all Divi sions. Th proportion of Hindus

is highest in the Himalayan Division, which is almost exclusively a Hindu tract The number of Sikh and Muslim females in this Division is particularly low, indicating that the followers of these religions are for the greater part immigrants, who have left their womenfolk behind On the other hand the presence of a large proportion of Christian females is mainly due to permanent Indian Christian population of hill resorts and also to the fact that the families of British soldiers serving in outlying and exposed places on the North-Western frontier remain at some hill-stations in the Punjab during the winter

In the Sub-Himalayan Division the proportion of females is comparatively higher among the prevailing religions, namely, Hindu, Muslim and Sikh Here the proportion of the Christians is considerably affected by the large excess in the number of European males over females The proportion among Europeans is 354 females to 1,000 males in the Province and 315 in the Sub-Himalayan Division

In the Indo-Gangetic Plain and the North-West Dry Area, the proportion has risen in all religions except in the former Division among Muslims For the proportion of sexes among these religions by age-periods for the whole Province and each Natural Division reference may be made to Subsidiary Tables II and III at the end of this Chapter

Sex Proportion by Caste

103 Just as the sex proportion varies in various localities and religions, so it does in the case of different castes or tribes Subsidiary Table IV at the end of this Chapter shows the proportion of females per 1,000 males for the main castes and for each religion, to which they belong and at different age-periods For facility of reference the proportion for the population of all ages for the most numerous castes as well as the four main criminal tribes are given in the margin The Kanets, who are found chiefly in the Kangra District of the Himalayan Division, have the highest proportion, *i e*, 941 females per 1,000 males The Dagi and Koh, another Himalayan tribe, shows the next highest proportion of 929 Bawarias, who are a criminal tribe, show the high proportion of 920 females to 1,000 males, but this figure is to some extent unreal as many of the adult males of this caste abscond from their homes in order to escape the provisions of the Criminal Tribes Act and when enumerated would be careful not to return their real caste Awans with a large number of males serving away from home, in the Army or the Police, and the itinerant Mirasi, many of whose males are often absent from their homes for considerable periods on professional trips and if questioned in remote places by a census enumerator would more often than not return their caste as Quraishi, show the next highest proportion of 871 The Aroras, a trading and commercial class, have a comparatively high proportion of females, *i e*, 865

Caste	Number of females per 1,000 males	Caste	Number of females per 1,000 males
1	2	1	2
1 Kanet	941	21 Nai	839
2 Dagi and Koh	929	22 Chuhra	838
3 Bawaria	920	23 Machhi	836
4 Awan	871	24 Tarkhan	836
5 Mirasi	871	25 Teli	833
6 Arora	865	26 Mochi	832
7 Mussalli	863	27 Arain	830
8 Meo	859	28 Biloch	829
9 Sayad	858	29 Sansi	823
10 Lohar	857	30 Brahman	822
11 Chamar	854	31 Gujjar	822
12 Aggarwal	853	32 Khatri	819
13 Chhimba	851	33 Ahir	811
14 Kamboh	851	34 Pathan	809
15 Rajput	850	35 Jat	803
16 Kumhar	850	36 Faqir	794
17 Sunar	847	37 Sheikh	794
18 Julaha	847	38 Kashmiri	778
19 Saini	839	39 Harni	690
20 Dhobi	839		

Of all the plain-dwellers, the Jain Aggarwals have the highest proportion of females, *i e*, 910 For the caste Aggarwal as a whole the proportion drops to

853 which is nearly equal to that of Aroras. Of all the castes the Aggarwal has the largest proportionate number of widows as will be noticed in the next Chapter and the smallest proportion of children under 10 and the same is the case with the entire Jain community This points to the conclusion that the comparatively lesser fertility of women gives them a greater chance of surviving Another caste with a fairly high proportion of females is the prolific Kamboh which has increased during the last decade by 20·60 per cent A Kamboh is a hardworking and prosperous agriculturist and as the doctrine of the survival of the fittest holds good he will have enough room to expand.

Among the other castes the case of Kumhar with 850 females per 1 000 males is of some interest. The male Kumhar is often absent from his home plying mules and donkeys on hire in distant places. Numerous Kumhars of sub-montane and neighbouring districts are found in the hill-tracts carrying on their animals, food stuffs and other commodities such as salt, tobacco *gur* and molasses for sale to hillmen. Returning home they bring, for selling in their own locality or making presents to their relatives, walnuts, soap-nuts, medicinal herbs, etc In the villages situated in the lower ranges of the Himalayas they barter common salt from the plains for *bera* (a kind of wild berry)

Turning now to the castes, which have a very small proportion of females, we find that the criminal tribe of Harnis has the lowest proportion of 690 females per 1 000 males. Unlike Bawarias the members of this tribe seem mostly to have taken to agriculture and are living in certain colony estates on the Lower Bari Doab where they are under the supervision of the Criminal Tribes Department. The males cannot absent themselves from their homes even for short periods. That the proportion of children among Harnis is the biggest among all tribes will be seen from Subsidiary Table IV to Chapter IV The excessive number of births by itself would cause comparatively greater mortality among women, a fact which partly accounts for their small proportion. The Harnis are at the same time among the poorest people of the Province and this would show that there is some connection between poverty and prolificness.

Hindu Faqirs also show a dearth of females. They are not really a caste but usually members of certain orders who often take a vow of celibacy Among Muslims, however Faqir is an agricultural and professional caste in the Eastern Punjab and the proportion of 794 is fairly high considering that some male Muslim beggars would naturally be included in the figures.

The low proportion of females among Kashmiris is due to the influx of male labourers who visit the plains in winter

The proportion of females among Sheikhs is small because of the medley of tribes and races included in the term Sheikh." Every Muslim, who is not sure of his caste or origin, or is anxious to hide it because of its inferiority would return himself as Sheikh.

The proportion of females among Jats has always been low The figures for the past three censuses are given in the margin, and indicate a steady increase In the days gone by the paucity of females was attributable partly to female infanticid which appears to be a thing of the past and the figures may be taken as representing normal condition

Census	1921	1911	1901
Jat	903	911	921

Among the Pathan there are 809 females per 1 000 males. This proportion would certainly be higher if Afghan labourers and traders who visit the Province in winter could be excluded.

CHAPTER VI.

CIVIL CONDITION

104 Introductory 105 Movement in actual figures 106 Proportional distribution according to age and civil condition 107 Age at marriage 108 Age at marriage from census data 109 Proportion of sexes in marriageable population 110 Polygamy 111 Polyandry 112 Special inquiry into marriage and fertility 113 Size of the family correlated to occupation of husband 114 Size of the family by religion and class 115 Size of the family according to age of wife at marriage 116 The amount of Sterility 117 Duration of marriages and size of family 118 Fertility data compared with general census 119 The widowed 120 Proportion of widows among females of main religions 121 Proportion of widows in different areas 122 Proportion of widows among different castes 123 Widow remarriage

Reference to Statistics.

Imperial Table VII gives the absolute figures of civil condition by main religions and age-periods for the whole Province, the British Territory, the Punjab States and each district and state as well as selected cities and towns

Imperial Table VIII gives the same information, though with slightly different age-groups, as Imperial Table VII for selected castes by locality

Subsidiary Table I gives distribution by civil condition of 1,000 of each sex, religion and main age-periods at each of the last five censuses.

Subsidiary Table II gives distribution by civil condition of 1,000 of each sex at certain ages in each religion and Natural Division

Subsidiary Table III gives distribution by main age periods and civil condition of 10 000 of each sex and religion.

Subsidiary Table IV gives proportion of sexes by civil condition at certain ages for religions and Natural Divisions.

Subsidiary Table V gives distribution by civil condition of 1,000 of each sex at certain ages for selected castes

Statistics obtained at a special enquiry into marriage and fertility are reproduced in the text as well as the unsmoothed figures of age and civil condition for the whole Province.

Introductory

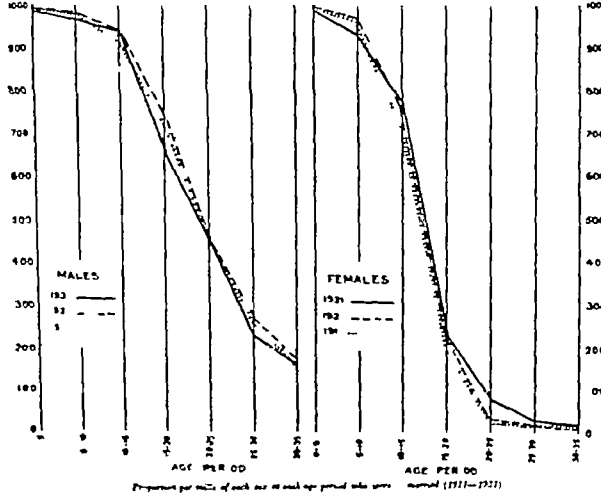

104 This Chapter deals with the marital condition of the population of the Punjab, or with the numbers of the married unmarried and widowed at different ages and in different localities religions and castes The divorced persons who had not remarried were included among the widowed Persons living as husband and wife, and recognised by custom as married, were to be treated as such though they had not gone through the ordinary formalities connected with marriage The number of such marriages is believed however to be very very small and nothing in comparison to that found in European countries where some people do not go through any religious ceremony because they think it is not necessary in a state of nature This is evidenced by the comparatively large number of children regarded by the law in European countries as illegitimate, though born to parents who are man and wife for all practical purposes The customary marriage in this country is confined to the "*Karewa*" known locally by different names, which is the taking into wedlock of the widow of a deceased brother or some other near relative, such as a first cousin

The Punjab Census Report of 1911 (p 275) deals at length with the customs and ceremonies, performed at the time of marriage among different communities and castes It is unnecessary to repeat them here except to mention that marriage is believed by a great majority of the people to be more or less a sacrament or a religious duty Divorce is unknown to the Hindu law, as also among Sikhs and Jains, and even among Muslims though it is permissible the cases of divorce are few and far between and the compilation of separate figures is uncalled for.

Before we proceed to discuss the statistical material compiled at the census with regard to civil condition, it appears necessary to refer to a detail of compilation adopted at this census, which was a departure from the procedure of the previous censuses In Imperial Table VII the figures of civil condition are combined with those of age During the smoothing of age figures, as explained in Chapter IV, the age and civil condition figures were sorted directly into

septennial and quinquennial age-groups. To take an example, ages were sorted direct into groups such as 7—13 and 14—16 which during tabulation were halved to form the quinquennial age-period of 10—15 the other half of the age-period 7—13 together with ⅓ of the number in age-group 4—6 forming the age-group 5—10 This process though it improved the age returns, and on the whole the returns of civil condition, caused a slight swelling of the figures of the married and the widowed in the case of the too young as explained below It is obvious that there would be more married and widowed persons at the ages of 12 and 13 rather than at the ages of 7 and 8 and so a process which divided the total number of the married and the widowed in age-group 7—13 equally into two parts and transferred one-half of the number to the age-group 5—10 would naturally give higher figures for the married and the widowed in the younger age-period. At the same time this process would reduce the number of such persons in the age-period 10—15 The figures of civil condition for ages 15—20 and 20—25 have not been so affected by the smoothing except that a certain number of unmarried females who would in accordance with the world wide practice return ages nearer 17 than 23 be transferred to age-group 20—25 The results obtained would therefore probably be nearer to the true state of affairs. The net result of smoothing is that a larger proportion of the population is found to be married or widowed at ages below 10 as compared to past censuses.

The effect of this change in procedure is brought out by the diagram below which shows for the last three censuses the proportion of the unmarried *per mille* of the population of each sex at each age-period below 15.

The proportion of the unmarried of ages 0—5 and 5—10 is now smaller among both sexes than at the two previous censuses The proportion of the unmarried of both sexes for ages 10—15 is for the same reason greater than before In the case of males the proportion of the unmarried among those aged 15—25 is slightly smaller on account of transfer of married males from higher ages, while the number of unmarried females in ages 15 and upwards appears to have increased

105 The table in the margin shows the variation per cent in the number of total unmarried, married and widowed for the last inter-censal period as well as at different ages The number of both the unmarried and the married has increased, while there is a small decrease n the number of the widowed The decrease in the widows of ages 0—15 is particularly noticeable and may be due partly to improved method of tabulation and partly to the improvement in conditions According to the law of averages the larger the number on which an average is based the more reliable is the result obtained The number of the widowed under 15 is a case in point Their total in the Province is 14,405 (males 6,974 and females 7,431), which is only a small fraction of the population In such a case even a slight mistake in the posting of results during any stage of abstraction might cause a large percentage of error, while in the case of the figures of the unmarried of same ages, which are many hundred times larger, similar errors will counterbalance each other and leave the results practically unaffected

Movement in Actual Figures.

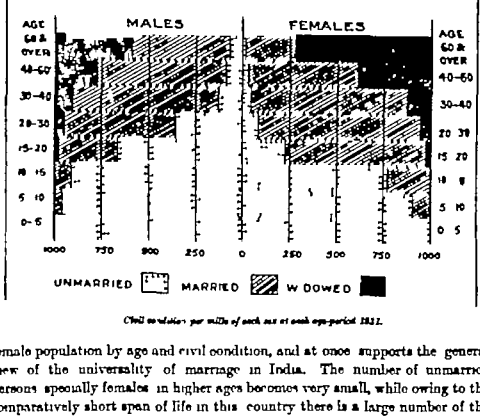

Increase or decrease per cent during the decade 1921—1931

Age-group	Total		Unmarried		Married		Widowed	
	Males	Females	Males	Females	Males	Females	Males	Females
1	2	3	4	5	6	7	8	9
All ages	13·3	13·7	14·2	18·4	15·8	14·0	−2·4	−1·0
0—15	14·4	16·9	14·0	15·4	31·0	33·9	−20·3	−11·1
15—20	24·7	34·4	12·4	34·0	58·8	35·3	27·5	9·9
20—25	36·1	35·2	39·1	174·3	36·8	30·6	−5·0	−5·3
25—30	12·3	12·2	−5·0	103·4	21·3	11·2	−5·5	4·8
30—40	13·8	8·5	10·7	12·9	16·8	6·9	−2·2	9·8
40 and over	−·2	−3·7	3·1	65·7	4	−5·3	−2·4	−3·1

Proceeding with the discussion we find that there is a noticeable increase in the number of the widowed aged 15—20, which is clearly due to the smoothing as male widowers of this age-period show the large rise of 27·5 per cent over the figures of the last census, while the next higher age-group, 20—25, shows an actual decrease of 5 per cent which is also met with in the widows of same age The cause responsible for the increase in the case of the married below the age of 10 holds good equally in the case of the widowed in age-group 15—20, which seems to have gained at the expense of the next higher age-group 20—25 This displacement in the number of widowers is noticeable in all other higher age-groups In the case of females the number of widows above 40 has slightly decreased, while there is increase at other ages though considerably smaller than the increase in total population except at ages 30—40

Proportional Distribution According to Age and Civil Condition.

106 The diagram below shows the distribution of the male and

Civil condition per mille of each sex at each age-period 1931.

female population by age and civil condition, and at once supports the general view of the universality of marriage in India. The number of unmarried persons specially females in higher ages becomes very small, while owing to the comparatively short span of life in this country there is a large number of the widowed particularly in ages over 40. Widow re-marriage is deprecated by a considerable section of the public and this fact tends to increase the number of widows elderly males widowed or otherwise generally wed young women and as older people are likely to depart first their death increases the number of widows still further.

The table in the margin gives the percentage of the married among those aged 15—40 belonging to different religions. It appears that Ad Dharmis have the greatest proportion of married persons in the reproductive period of life. The proportion among Hindus is higher than that among Muslims and Jains which is about equal. Sikhs have fewer married males owing to the paucity of women among them, but have for the same reason nearly the highest proportion of married females. The Christians Buddhists and Zoroastrians have the fewest of both sexes married.

Religion.	%Males.	%Females.
1		
All Religions	49	51
Hindu	48	53
Ad Dharmi	70	9
Sikh	55	54
Jain	59	60
Buddhist	49	51
Zoroastrian	30	71
Muslim	58	54
Christian	33	38

Rise in Marriage.

107 The number of persons returned as married below the age of 15 has increased at a rate more than double that of the general rise in total population (*vide* the table in paragraph 103) and this in spite of the legislative measure recently passed to prohibit males below 18 and females below 14 from marrying. Perhaps this measure was in a way responsible for swelling the number by accelerating early marriages in anticipation of the prohibition.

*The Sarda Act as passed in 1929, but did not come into force until 1st April 1930.

The total unsmoothed figures of civil condition for the Province are reproduced in the table below

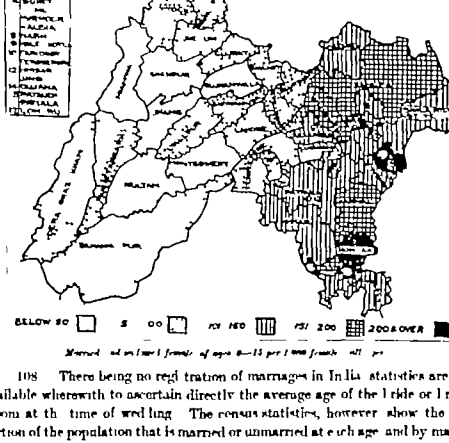

Unsmoothed figures by civil condition and age (whole Province)

Age-period	Unmarried			Married			Widowed		
	Persons	Males	Females	Persons	Males	Females	Persons	Males	Females
0—3	3,188,870	1,611,470	1,577,400	[illegible]	1,331	[illegible],184	72	56	16

67—73	12,271	11,[illegible]	1,[illegible]	143,[illegible]	113,[illegible]	[illegible],[illegible]	226,[illegible]	99,[illegible]	1,[illegible]
74 and over	11,[illegible]	[illegible],[illegible]	1,[illegible]	[illegible],[illegible]	[illegible],[illegible]	21,[illegible]	1,[illegible]	[illegible],[illegible]	[illegible],[illegible]
Total for all ages	*13,81,[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible],[illegible]*	*[illegible],[illegible],[illegible]*

It is significant that while only 391 750 persons of both sexes were returned as married up to age 0—13, 625 198 were so returned at ages 14—16. The latter are the ages at which marriage of females is permissible under the recent legislation and at which many people are actually married. A contributory cause for the large number doubtless is preference for 15 as the year of age. At last census the number of those recorded as married among those aged 0—14 was 531,619 and the corresponding figure for the present census for ages 0—15 after smoothing comes to 707 199. In the case of both sexes those returning themselves as married at ages 14—16 some were undoubtedly younger than 15 while others might be older. The smoothing has thus corrected the age as well as the civil condition of a certain number, who may not have really attained these ages but returned them owing to their being married.

That the people are returning in large numbers the ages at which marriage is permissible under the law is an indication of the new piece of legislation having become widely known. The large number of marriages celebrated in a hurry before the Act came into operation might however be regarded as a transitory step and it can be reasonably hoped that cases of early marriage will be less numerous at the next census.

The map below shows the local distribution of married and widowed females below the age of 15. It indicates where the age at marriage of females is relatively low. The results are given in terms of the proportion of married and widowed females aged 0—15 *per mille* of the total female population of all ages. Early marriages of females seem to be in vogue in the Eastern Punjab particularly in Rohtak District and Sirmoor and Bilaspur States. In the upper reaches of Sirmoor marriages of infants are reported to be common. The age of marriage is comparatively low in Jind, Karnal, Hoshiarpur and Kangra. It is a little higher in Ambala, Patiala, Hissar and Gurgaon and is highest in the western or the Muslim part of the Province.

Married children (under 15) per 1,000 females (all ages)

Age at Marriage from Census Data.

108. There being no registration of marriages in India, statistics are not available wherewith to ascertain directly the average age of the bride or bridegroom at the time of wedding. The census statistics, however, show the proportion of the population that is married or unmarried at each age and by making certain assumptions we can use them to estimate the average ages at which marriage takes place. The calculation below gives the average age of marriage for females and males of all religions. The reader who is interested in the subject may work out for himself the average age in each religion by the same method. The method is the same as that given in the Bengal Census Report of 1911 (pages 260 to 269) and is reproduced below for facility of reference.

If U_x is the number of females whether unmarried, married or widowed at the age of x, and P_x is the proportion between the ages of x and $x+1$ returned as married or widowed then U_x is the number of females between x and $x+1$ who have been married. Assuming that *mortality rates are the same for married as for unmarried females and that the age distribution of females remains the same for a year*, then of the females between x and $x+1$ who had been married U_{x+1} will be living one year later and the number of married females between the ages of $x+1$ and $x+2$

U_{x+1} P_{x+1}. The difference between these two quantities U_{x+1} P_x and U_{x+1} P_{x+1} must be the number of marriages which took place during the year among the women who were aged x at the beginning and the average age at which these marriages took place would be almost exactly $x+1$ years. We, therefore account for all the marriages which took place in the year by the series $\Sigma U_{x+1}(P_{x+1}-P_x)$.

The marriages $U_{x+1}(P_{x+1}-P_x)$ took place at the average age $x+1$ and $U_{x+2}(P_{x+2}-P_{x+1})$ at the average age $x+2$ and so on.

Thus the average age at which the marriages took place will be $\frac{\Sigma U_x (P_x - P_{x-1})x}{\Sigma U_x (P_x - P_{x-1})}$

The actual calculation for the average age of bride and bridegroom in the Province for all religions is given in the following two tables. The proportion P_x in column 2 is obtained by running a smooth curve through the points determined by the proportions of the married and widowed in quinquennial age periods and the figures in column 3 are taken from the graduated age distribution for females and males given in Subsidiary Table XI to Chapter IV.

Calculation of the average age of the bride and bridegroom

Age	Married females per 1000	Number living in thousands of the female population	Number of marriages which take place when the bride's age is between $x-\frac{1}{2}$ and $x+\frac{1}{2}$ (years)	Age	Married males per 1000	Number living (in thousands) of the male population	Number of marriages which take place when bride's age is between $x-\frac{1}{2}$ and $x+\frac{1}{2}$ (years)	
x to $x+1$	P_x	U_x	$U_x(P_x-P_{x-1})$	$U_x(P_x-P_{x-1})x$	x to $x+1$	P_x	U_x	$U_x(P_x-P_{x-1})$	$U_x(P_x-P_{x-1})x$
1	2	3	4	5	1	2	3	4	5
0—1	0	2,402	0	0	18—19	270	2,458	80	1,518
1—2	4	2,850	11	11	19—20	850	862	22	418
2—3	17	2,696	31	68	20—21	850	4,226	127	2,540
3—4	20	1,770	19	117	21—22	875	530	13	273
4—5	40	3,020	42	168	22—23	895	1,906	40	880
5—6	60	1,010	60	300	23—24	915	751	15	345
6—7	76	2,880	40	276	24—25	930	1,150	18	432
7—8	93	2,760	72	764	25—26	945	4,510	68	1,700
8—9	120	3,098	77	616	26—27	955	1,071	11	286
9—10	150	2,204	68	612	27—28	965	730	7	189
10—11	180	3,000	90	900	28—29	970	1,300	7	196
11—12	220	1,551	62	682	29—30	974	192	2	58
12—13	280	2,011	171	2,052	30—31	976	5,114	5	150
13—14	505	1,728	216	2,808	31—32	980	201	1	31
14—15	594	2,118	191	2,674	32—33	981	1,214	1	32
15—16	666	2,200	163	2,445	33—34	985	262	1	7
16—17	715	2,096	102	1,632	34—35	986	426	0	0
17—18	760	1,156	52	884					

The figures in column 4 become very small after the age 34 and it is useless to carry the series any further

Then $\frac{\Sigma U\ (l\ -P_{-1})x}{\Sigma U\ (P\ -P_{-1})} = \frac{29\,320}{2,200} = 13{\cdot}33$ years and thus the average age of the bride at marriage in the Province is 13·33 years.

Calculation of the average age of the bridegroom at marriage

Age	Married and Widowed per 1,000	Number of unmarried males in the population	Yearly Life Table Survivors	Number of marriages in the Life Table population	Age	Married and Widowed per 1,000	Number of unmarried males in the population	Ratio of marriages in the Life Table population to unmarried males	
to $+1$	l	U_x	$U_x(P-P_{x-1})$	$U\ (P-P_{x-1})x$	$+1$	P	U	$U\ (P-P_{x-1})$	$U_x\ (P-P_{x-1})x$

Here $\frac{\Sigma U\ (l\ -P_{-1})}{\Sigma U\ (P\ -P_{-1})} = \frac{29\,629}{1\,648} = 1{\cdot}98$ years and thus the average age of the bridegroom is 1·98 years.

These calculations, which give the average age at marriage for females as 13·33 and for males as 17·98 years, are based on two assumptions viz. (*a*) the age distribution does not change appreciably from year to year and (*b*) the mortality rates are the same among the married as among the unmarried. The first assumption is not far from the truth. We have not used the differences between the proportion of the population at one age and those at another and if the distribution changes slightly it does not affect the result at all appreciably. The second assumption is somewhat arbitrary as undoubtedly the mortality rates are higher in the ages of early maturity in the case of married females than of the unmarried. But the number of females who are married and survive a year would be affected only slightly. The over-statement in the ages of married girls of younger age results in an under-estimate of the proportion of married in the age-period 10—15 thus raising a little the average age of the bride at marriage. The figures of males are practically free from this defect. The disparity between average ages is therefore probably less than 4·6 years brought out by our calculations. For practical purposes we may assume that the average age of the bride at marriage is 13½ years and that of the bridegroom a little under 18.

Proportion of Sexes in different Religious Populations.

109. In the last Chapter we discussed at length the proportion of the sexes at different ages and among different religions and other subjects of a kindred type. Here it may be useful to see the proportion of the sexes in the

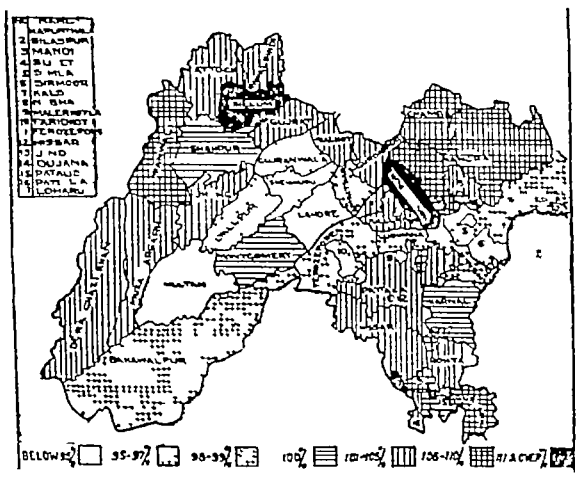

marriageable population The scarcity of females in the Province is well-known, and directly or indirectly is the cause of various complications from an administrator's standpoint The number of marriageable males (unmarried as well as widowed) of the ages 15 to 40—to ignore for the time being those who are already married or are older but still wishful for marriage—as compared to unmarried females of marriageable ages (*i e*, 15—40) is as 5,735 1,000 or about six times as much Even if the widows aged 15 to 40 were to remarry freely the proportion would still be as high as 3,252 males to 1,000 females The situation would thus be greatly relieved, but it would not approach anything like the conditions in some foreign countries where the difficulty is to secure husbands In the case of different religions the proportion of marriageable males per thousand unmarried females (aged 15—40) is 8,804 among Hindus, 6,635 among Sikhs, 5,755 among Jains, 4,702 among Muslims and 3,943 among Christians If the number of widows aged 15—40 could be available, as it certainly is to some extent among Muslims, Christians and Hindu and Sikh Jats, the proportion would drop to 3,240 among Hindus, 4,178 among Sikhs, 2,321 among Jains, 3,062 among Muslims and 3,142 among Christians

Polygamy.

110 There are 5,964,546 married males and 5,994,777 married females in the Province In other words there are 30,231 more married females than married males, which means an excess of 5 per cent This is accounted for by the excessive temporary or semi-permanent emigration of males as compared to females It is thus obvious that only a very small amount of this excess could be due to polygamy The figures of married males and females among the main religions are given in the margin The Muslims, generally believed to be the most polygamous, contain 4 per cent more wives than husbands while in the case of Sikhs this percentage is 2 6, mainly due to a comparatively larger proportion of Sikhs who emigrate The excess in both cases is small compared to the actual numbers of the married, and shows that polygamy is not practised in the Province to any appreciable extent Hindus and Christians show a larger number of husbands than wives This may be due in the case of Hindus to the presence of labourers from Rajputana, who do not in all cases bring out their wives The figures of Christians show fewer wives on account of the inclusion among them of European immigrants whose wives are often away in Europe

Religion	*Married (absolute figures)*	
	Males	Females
1	2	3
All Religions	*5,964,546*	*5 994,777*
Hindu	1,877,260	1,873,470
Sikh	828 073	849,708
Jain	8,284	8,454
Muslim	3,068,096	3,081,653
Christian	79,720	77,585

The map in the margin shows the percentage of married females to married males in each district and state The districts with more than 100 married females per 100 married males may, in the absence of special causes, be regarded as comparatively more polygamous than others Prominent in this respect are Jhelum and Hoshiarpur, in both of which the disparity may be to a considerable extent due to the absence of husbands from their homes It has been mentioned in Section 7

Number of married females to 100 married males

of Chapter I that the Army obtains a large number of recruits from Jhelum while private employment and military service draw away numerous adult males from Hoshiarpur and Kangra. The percentage is also high in Chamba and Bilaspur States where the proportion of women is comparatively larger and polygamy among certain classes well known wives being a valuable asset to those engaged in agriculture. The Mianwali District in the west and Gurgaon in the east also show a high percentage. The main reason in the case of the former is probably polygamy and in the case of the latter emigration of males to other districts in search of labour resulting from insecure agricultural condition.

Polyandry

111. The practice of polyandry was believed to be prevalent in certain part of the Himalayas and the territory known as the Malwa situated between the Sutlej and the Ghaggar rivers (in Ambala District). The percentage of married females to males in the map in the last paragraph shows Bashahr Sirmoor Ambala, Kalsia Ludhiana, Maler Kotla, Ferozepore Faridkot and Amritsar as having a smaller number of wives than husband. The proportion of married men in these areas would be still greater but for the fact that males predominate in the large emigration from those areas. The smaller percentage of married females undoubtedly creates a suspicion of polyandry particularly in the hill tracts. There are certain other districts and states such as Simla Multan, Lyallpur Gujranwala Sheikhupura Lahore and Bahawalpur which also show a larger number of married males compared to married females. These include areas which have been developing as a result of canal irrigation or which contain large towns and in both cases the element of immigration is substantial, resulting in the presence of more married males than married females. Polyandry obviously plays no part in the disparity of the proportions in these areas.

Special Enquiry into Marriage and Fertility

112. Reference was made in Chapter V to a special enquiry into marriage and fertility made in typical areas of each district and state. As a result of this enquiry six tables have been prepared the table relating to the sex of the first born appeared in Chapter V while the others are reproduced in paragraphs that follow. According to the statistics given the average number of children born per 100 wives of all religion works out at 396. In some cases a marriage no doubt result in the birth of twice as many children or even more while in a number of cases the wedlock is altogether barren. No doubt averages based on a large number of cases examined produce result that indicate in the long run the normal size of the family.

Size of the Family Correlated to Occupation of Husband.

113. The table below shows the classification according to the occupation of the husband of 173,422 families examined in the various districts and states. The families have been lumped together all occupations

TABLE IL—SIZE OF FAMILY ACCORDING TO OCCUPATION OF HUSBAND.

| Particulars. | Number of Families examined | Total Number of Children born | Average number of children born per 100 wives | Number of Families having no children | Number of Families having 1 child | Number of Families having 2 children | Number of Families having 3 children | Number of Families having 4 children | Number of Families having 5 children | Number of Families having 6 children | Number of Families having 7 children | Number of Families having 8 children | Number of Families having 9 children | Number of Families having 10 children | Number of Families having 11 children | Number of Families having 12 children | Number of Families having 13 children | Number of Families having 14 children | Number of Families having 15 children | Number of Families having 16 children | Number of Families having 17 children | Number of Families having 18 children | Number of Families having 19 children | Number of Families having 20 children | Number of Families having 21 children | Number of Families having 22 children | Number of Families having 23 children | Number of Families having 24 children | Number of Families having 25 children | Number of Families having 26 children | Number of Families having 82 children | Number of Families having 83 children | Number of Families having 84 children | Number of Families having 85 children | Number of Families having 86 children | Number of Families having 87 children | Number of Families having 88 children | Number of Families having 89 children | Number of Families having 90 children | Number of Families having 91 children | Number of Families having 92 children | Number of Families having 93 children | Number of Families having 94 children | Number of Families having 95 children | Number of Families having 96 children | Number of Families having 97 children | Number of Families having 98 children | Number of Families having 99 children | Number of Families having 100 children | Number of Families having 101 children | Number of Families having 102 children | Number of Families having 103 children | Number of Families having 104 children | Number of Families having 105 children | Number of Families having 106 children | Number of Families having 107 children | Number of Families having 108 children | Number of Families having 109 children | Number of Families having 110 children | Number of Families having 111 children | Number of Families having 112 children | Number of Families having 113 children | Number of Families having 114 children | Number of Families having 115 children | Number of Families having 116 children | Number of Families having 117 children | Number of Families having 118 children | Number of Families having 119 children | Number of Families having 120 children | Number of Families having 121 children | Number of Families having 122 children | Number of Families having 123 children | Number of Families having 124 children | Number of Families having 125 children | Number of Families having 126 children | Number of Families having 127 children | Number of Families having 128 children | Number of Families having 129 children | Number of Families having 130 children | Number of Families having 131 children | Number of Families having 132 children | Number of Families having 133 children | Number of Families having 134 children | Number of Families having 135 children | Number of Families having 136 children | Number of Families having 137 children | Number of Families having 138 children | Number of Families having 139 children | Number of Families having 140 children | Number of Families having 141 children | Number of Families having 142 children | Number of Families having 143 children | Number of Families having 144 children | Number of Families having 145 children | Number of Families having 146 children | Number of Families having 147 children | Number of Families having 148 children | Number of Families having 149 children | Number of Families having 150 children | Number of Families having 151 children | Number of Families having 152 children | Number of Families having 153 children | Number of Families having 154 children | Number of Families having 155 children | Number of Families having 156 children | Number of Families having 157 children | Number of Families having 158 children | Number of Families having 159 children | Number of Families having 160 children | Number of Families having 161 children | Number of Families having 162 children | Number of Families having 163 children | Number of Families having 164 children | Number of Families having 165 children | Number of Families having 166 children | Number of Families having 167 children | Number of Families having 168 children | Number of Families having 169 children | Number of Families having 170 children | Number of Families having 171 children | Number of Families having 172 children | Number of Families having 173 children | Number of Families having 174 children | Number of Families having 175 children | Number of Families having 176 children | Number of Families having 177 children | Number of Families having 178 children | Number of Families having 179 children | Number of Families having 180 children | Number of Families having 181 children | Number of Families having 182 children | Number of Families having 183 children | Number of Families having 184 children | Number of Families having 185 children | Number of Families having 186 children | Number of Families having 187 children | Number of Families having 188 children | Number of Families having 189 children | Number of Families having 190 children | Number of Families having 191 children | Number of Families having 192 children | Number of Families having 193 children | Number of Families having 194 children | Number of Families having 195 children | Number of Families having 196 children | Number of Families having 197 children | Number of Families having 198 children | Number of Families having 199 children | Number of Families having 200 children |
|---|---|---

being divided into 17 groups The number of families and of the children born and surviving is given in the case of each occupation followed by husband the average number of children born per 100 families and the number surviving out of every 1 000 born being also shown

It appears that lawyers, doctors and teachers have the largest proportion of children born per 100 families, while the rate of survival among their children is also high evidently because of the greater care bestowed on them It may be that the high proportion of children born is due to the members of this class remembering each and every departed child better than other classes not equally intelligent The sweepers, field labourers and beggars also seem to beget a large number of children while domestic servants have the fewest The survival rate is higher among the children of *jagirdars*, rent-receivers, etc , while weavers and beggars are not far behind in this respect The children of sweepers and washermen on the other hand have one of the lowest rates of survival indicating that a high birth-rate when accompanied by poverty and unhygienic work leads to a high death-rate

Size of the Family by Religion and Class

114 On page 153 in Chapter V were set forth the names of castes included in each of the classes, into which families of main religions have been divided Separate figures are given in the table below, which shows the size of family for different classes and religions as well as the number of wives who were married at different ages in each case

TABLE III —SIZE OF FAMILIES BY CLASSES OR RELIGION OF HUSBAND

It will be seen that proportionately the greatest number of children is born among* Indian Christian families, and the next highest among Hindus and Ad-Dharmis who like Indian Christians contain a large number of persons of lowest castes Sikhs come next with Hindus not far behind The Jains and Muslims have the lowest number of children born This result will cause surprise so far as Muslims are concerned, as they are well-known to be fairly prolific This result which is not confined to a few areas can be explained only by the fact that Muslims who are comparatively more ignorant forget some

* It has to be remembered that the number of Ad Dharmi Christian and Jain families dealt with is comparatively small

of their children they may have lost. Further as pointed out in paragraph 50 of Chapter I the greater increase in the population of Muslims is chiefly due not to a very much higher birth-rate but to a comparatively higher survival rate. We will revert to this subject in the Chapter on Religion.

Turning now to the size of family among different classes of the main religions we find that among Hindus Classes II (cultivators) and III (artisans) have the largest number of children born. The proportion of the survivors on the other hand is higher among Classes IV (backward) and I (intellectual). Among Sikhs the cultivators have the smallest proportion of children born or perhaps like Muslims they forget some who died young though this proportion is higher than that among Hindu artisans. Among Muslims the greatest number of children per family is found in Class I (intellectual) and the lowest in Class II (cultivators) It is the latter class that brings down the Muslim figures, while the other classes can hold their own against those of other religions. As we know it is the agriculturist class which is the most ignorant The proportion of survivors is also in the same order except that artisans seem to have fewer survivors than the backward classes On the whole it can be said that the artisan classes have a greater number of children born to them, but that high survival rate is found either among the richest or among the poorest classes.

Size of Family According to Age of Wife at Marriage.

113 Early marriages are quite common in this country but it is seldom that a wife goes to live with her husband before attaining the age of puberty The period of marriage for the purpose of this enquiry was to be reckoned from the date on which the wife shifted to her husband s home The question to elicit this information being of a rather delicate nature had to be put in a tactful manner so as not to cause offence In the table below is given the number of wives married at different ages among different religions and the classes of main religions. The number of children born and surviving as well as the average per 100 women in each case is also given below

TABLE IV—A [illegible] SIZE OF F[illegible] CORRELATED WITH AG[illegible] OF WIFE AT MARRIAGE.—concld

The subject of the age of wife at marriage, about which the "special enquiry" figures are given in this table, has been dealt with above and it will be sufficient here to comment on the effect of early marriage on comparative fertility The one hundred women of all religions married below the age of 12 have on an average 366 children born to them Ad-Dharmi and Christian child-wives seem to be most prolific having the high average of 421 and 423, respectively The average number of surviving children per 100 wives of all religions falling in this category comes to 271 so that almost every wife has on an average lost one child If the sterile cases, of which there is a slightly higher proportion among these wives are excluded the number of children for fertile marriages would be 391 The wives married at ages 13—14 have a slightly greater average number of children born (371 per hundred) but a smaller number surviving (265 per hundred) The wives married at ages 15—19 and upwards have everywhere a larger number of children born than child-wives, as the proportion of sterile cases is obviously low among them. The proportion of survivors among their children is however not so high The average number of surviving children per 100 wives of all religions married at ages 15—19, 20—29 and 30 and upwards is 272, 321 and 483 respectively The apparently higher rates for women marrying after the age of 30 is due to the fact that the majority of them are widows, who are likely to mix up the children born of some previous marriage with those born after remarriage The number of these cases too is small, and consequently the results are not so reliable It would seem therefore that the children of wives married at older ages die at a comparatively higher rate

Fertile cases only

Age of wife at marriage	Number of children born per 100 families	Number of children surviving per 100 families

20—29	462	333
30 and over	687	510
All Ages	*417*	*300*

The marginal table shows the proportion of children for wives married at different ages irrespective of duration and excluding sterile cases We find that wives married below 12 have a higher proportion of children surviving than those married at higher ages Is the greater survival rate among the children born to young

mothers due to the weeding out of the weaker mothers as a result of the early child-bearing or to some physiological cause which determines that children born in early ages should be more hardy? A definite answer to this question is not possible in the absence of the record of the ages of women at marriage and subsequent history of their children

The Account of Sterility.

110. The table below gives the actual number of sterile and fertile marriages observed for different durations of married life, for wives married at different ages, separately by religions and classes

The derivative table in the margin shows the percentage of fertile and sterile cases with different durations of marriage, separately for different ages of wives at marriage, by main religions It will be seen at a glance that the percentage of fertile marriages generally is very high in this Province Even among the child-wives of all religions, by which are meant those married below the age of 12 the percentage of sterile cases, after 15 years' duration is reduced to two per cent The percentage of such cases for wives married at ages 13—14, 15—19 and 20—29 after a similar duration is only one per cent The wives married at [illegible]s thirty and over, whose number is comparatively small, have a greater [illegible]adency to be sterile These results are to be taken subject to the con[illegible]deration that in some cases wives are deserted or divorced when their sterility [illegible]s established after a few years' wedded life Another thing that has also to [illegible]be borne in mind is that some families not blessed with children may have refused to furnish this information, or may not have been questioned by the enumerators owing to the delicacy of the subject One thing, about which we can safely generalise from these figures, is that the higher the age of wife at marriage the higher is the percentage of fertility even for shorter durations of marriage The highest percentage of sterility for duration of marriage beyond 15 years is 8 among Ad-Dharmi wives married when below 12, which indicates the permanent harm that may be entailed by early marriage As against these proportions the sterility is much more pronounced in European countries where the percentage of marriages that prove sterile would appear to be at least 6 *

* Pell. Law of Births and Deaths, p 27 Darwin mentions that 19 per cent of the English nobility are childless, "which is more than three times the average for the rest of the nation."

Ibid, p 123 "There seems to be a steady rise in the figures of sterile marriages as the birth rate falls. In France such marriages are about 20 per cent. of the total marriages the percentage among the wealthier classes being 25"

Duration of Marriage and Size of Family.

117 In the table below the families of different religions and classes have been divided into groups on the basis of the duration of marriage. The number of children born to families with each duration is shown, as also the number born per 100 wives in each case.

TABLE VI.—*Duration of marriage correlated with sex of religion of family.*

The durations of marriage met with most frequently are between 10 and 19 years, while naturally the greatest number of children born belongs to the marriages which have lasted between 20 and 30 years. Very few marriages seem to last longer than 30 years as during this period in most cases one or the other of the spouses is removed by death. The intervals at which children are born to a wife appear to be more or less uniform, the rate being almost one child every five years or so, although the average of duration ending with years that are multiples of five is swollen like other similar returns. For in t nce the effect of plumping on the 10th year of duration is prominent in these figures for wheres the number of children among one hundred couples who have returned a duration of 9 years comes to 187 children the average for those who have completed ten years or only a year more jumps to 2[illegible]8. This [illegible]s mean that some couples with a longer duration of marriage and consequently having a larger number of children, and some with a smaller duration have returned a duration of 10 years owing to a preference for that figure.

The number of children per one hundred couples of all religion with a duration of 33 years and over is 560. The corresponding average for European countries appears to be 420

[1] Cf. Law of Births and Deaths, p. 15. According to Dr. Dublin and other statisticians the European average is that the married women of 45 have on their [illegible] an average of 4.3 per marriage

Fertility Data Compared with General Census

118 While it is impossible to compare all the figures collected at this special enquiry with the general census results a comparison is possible in certain aspects For instance, as already noticed on an average one child is born to a married woman every five years Taking all the married females alive of ages of 15—45 and assuming that all the children born during the last ten years were born to them we get the results shown in the margin Actually some of the women might have died leaving children, while some who had children born to them during the last ten years may now be over 45 We find that for 100 women of all religions according to the figures of the general census, the number of children born comes to 224 or a little over two children in ten years The effect of infant mortality is also apparent from the figures in the third column, and we find that out of 224 children born 178 survive to be included in the population under ten recorded at this census The figures of Hindus and Muslims are also given, the former comprise Sikhs and Jains as well, there being no separate birth record for these religions This shows that Muslims had a slightly larger number of children than Hindus This is probably true as the record made at the time of birth would not like the special enquiry held many years after their death omit the children of Muslims The comparative survival rates are also clearly brought out Compared to this according to the special enquiry the number of children born to 100 wives with a ten years duration of marriage comes to 194 The figures for England and Wales needless to say, present a great contrast

Religion	Proportion of children born in the last ten years to 100 married females aged 15—45	Proportion of children under ten years to 100 married females aged 15—45
1	2	3

England and Wales (1921)	176	149

The Widowed

119 In the remaining paragraphs of this Chapter we shall take up the study of the subject of the widowed At this census there were 2,822 widows below ten, 7,431 below fifteen and 26,602 below twenty These figures are pathetic enough, but they seem insignificant when we realise that in ages above 40 every other woman is a widow The contrast that these figures present with the number of widows in England and Wales is most striking indeed, and in the table below is given the distribution by age and civil condition of 10,000 persons *of this Province according to the census of 1931* and of England and Wales for the census of 1921 The figures indicate the proportionate number of each sex unmarried, married and widowed at different ages, and whereas they facilitate comparisons of the other two civil conditions as well they prominently bring to notice the comparatively high proportion of widows in this Province

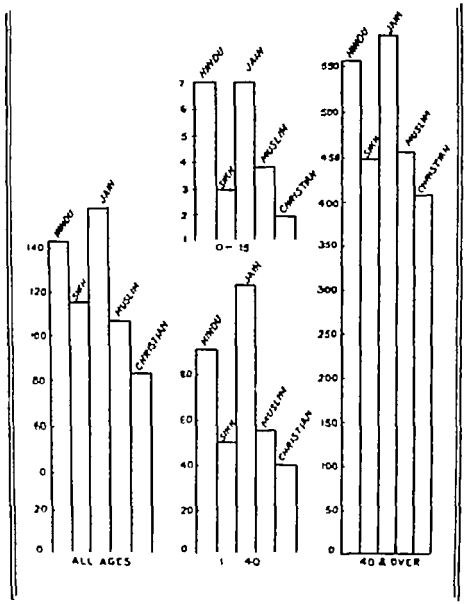

Distribution of 10,000 of total Population by Civil Condition and Age.

Age-Group	Punjab (Census 1931)								England and Wales (Census 1921)

There are hardly any widows below 20 in England and Wales, and their number even up to the age of 45 is almost insignificant. The particularly small number of widowers points to the facility with which they can remarry On the other hand the number of widowers in this Province is enormous. The fact that there is proportionately a higher number of married males in England and Wales at the ages of 35 and upwards shows that owing to longer life and late marriage the effective period of marriage in that country is much longer than here. The table also indicates in no uncertain terms the difference between the age of marriage in this Province and that in England and Wales.

Proportion of Widows Among Females of Main Religions.

120. The large number of widows presents a pathetic picture among the followers of all religions, though they are not quite uniform. The diagram given below shows the number of widows per 1 000 females in each age-period by main religions. The scales for different age-periods are different.

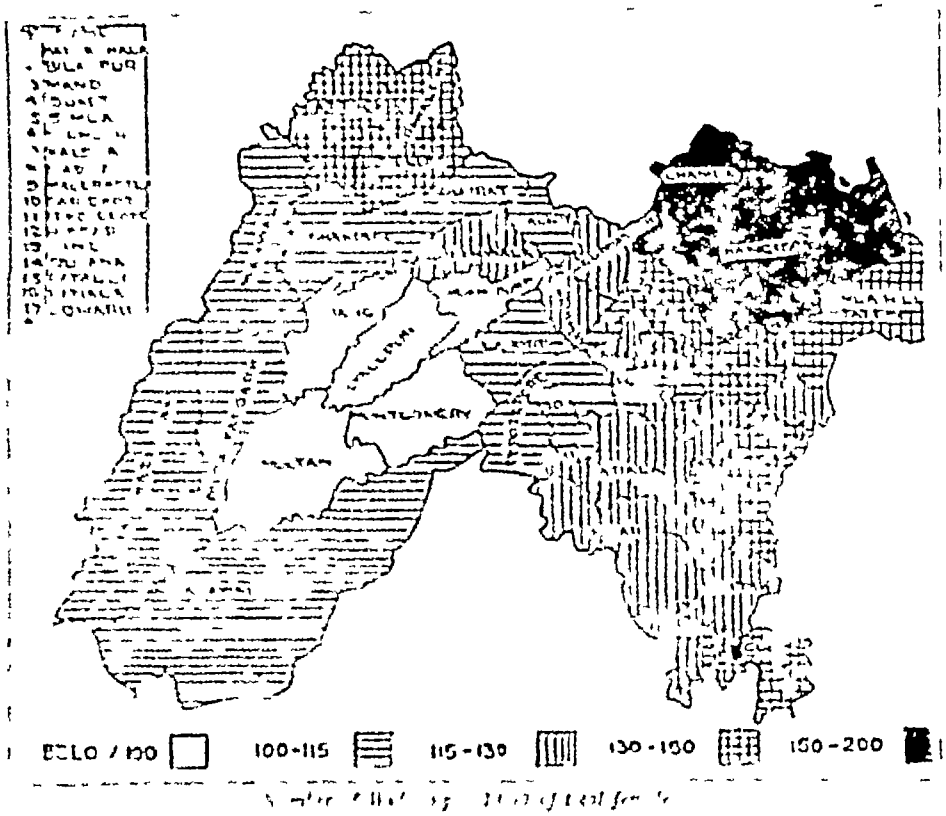

* Number of Widows per 1 000 of females in the particular age-group of each age-period.

It will be seen that Jains have the highest proportion of widows at all ages and Hindus the next highest Muslims and Sikhs are nearly on the same footing except that in the case of Sikhs the proportion for all ages is slightly lower but lower in the child-bearing period of life and ages over 40 This is

accounted for by the smaller proportion of girls aged 0—15 among Sikhs as compared to Muslims Consequently the rate of remarriage of widows among Sikhs would appear to be comparatively higher The proportion of widows among Christians is the smallest.

Proportion of Widows in Different Areas

121 The map below shows the local distribution of widows and their

number *per mille* of total females in each district and state The highest proportion of widows is found in Kangra District and Mandi Suket and Bilaspur State In the plains the small State of Pataudi heads the list Hoshiarpur, Ambala and Gurgaon have also a fairly high proportion In the north-west the proportion of widows in Jhelum Rawalpindi and Attock with their Rajput and other martial races is not at all low, a fact which refutes the view commonly held of Muslim widows remarrying in large numbers In this map all the colony districts (except Shahpur, which has a large *thal* area and the salt range similar in character to Jhelum and Attock inhabited by Awans) stand out prominently as having the smallest proportion of widows The reasons for this are not far to seek, the people of colony areas are comparatively prosperous and take into wedlock all women of marriageable age, whether widows or virgins The heterogeneous character of the population makes it easy for the people to marry widows in the absence of prejudices peculiar to their home districts

Proportion of Widows Among Different Castes

122 The marginal table gives the number of widows *per mille* of total females of each of the main castes, which have been arranged alphabetically The Brahman with 198 widows out of a thousand women, or nearly one-fifth, tops the list The Hindu Rajput with high feudal and military traditions comes next followed by the trading Aggarwal (172), a good third Then come Khatri (151),

Caste		Widows
1		2
Aggarwal	(Hindu)	172
Do	(Jain)	165
Arain	(Muslim)	95
Arora	(Hindu)	174
Do	(Sikh)	111
Awan	(Muslim)	116
Baloch	(Muslim)	90
Brahman	(Hindu)	198
Jat	(Hindu)	126
Do	(Sikh)	121
Do	(Muslim)	98
Khatri	(Hindu)	151
Pathan	(Muslim)	116
Rajput	(Hindu)	181
Do	(Sikh)	95
Do	(Muslim)	118
Sayad	(Muslim)	131
Sheikh	(Muslim)	103
Christian	(Total)	81
Chuhra	(Hindu)	91
Do	(Sikh)	99

Arora (134) and Jat (123) Among Muslims the high-born Sayad (131) the martial tribes of Pathan (110) and Awan (115) and the heterogeneous collection, known as Sheikh (103) have the highest proportion of widows while the Jat and Baloch have the smallest population. Among Sikhs the Jat (124) is the aristocrat and the Arora (111) is a mere shop-man and has a smaller proportion of widows. As compared with the figures quoted above the number of widows among Christians (81) is very small indeed

Widow Remarriage.

123 Among th followers of Islam and Christianity there is no religious tenet prohibiting widow remarriage. But social customs come into play and am ng Muslims the castes and tribes enjoying high social status consider it derogat ry for their widows to seek remarriage. For example Jats Rajputs Sayads and Pathans in many cases would not permit their widows to remarry Evidently they have been influenced by their long association with the Hindus. The table in the margin shows the difference between the proportions of Hindu and Muslim widows in the female population f their respective religion in various age periods. Thus a rough idea of the extent of remarriage among Mu lim widows can be formed from these figures

Proportion of widows per mille of all females at d f rent age periods

Age-period	Hindu.	Muslim.	Difference per mille.
1	2	3	4
0—5	2	1	1
5—10	6	3	3
10—15	5	2	33
15—40	33	177	108
40 and over			

Th number of widow remarriages among caste Hindus is still very small a is apparent from the figures for castes given in the last paragraph Among some Hindu castes su h as Jats widow remarriage i common as indicated by the smaller proportion of widows among them (125 *per mille* of total females as against 198 among Brahmans) The actual figures of remarriage of caste widows given below are based on the information supplied by th Vidhva Vivah Sahaik Sabha the main society in the Province which encourages widow remarriage. The figures comprise widow remarriages in the Punjab and the N W F Pro inces and indicate an increase from year to year but even so the number of remarriages up to-dat is negligible in view of the enormous number of widows of marriageable ages

CHAPTER VII.

INFIRMITIES

124 General 125 Insane 126 Local distribution of insanity 127 Sex proportion and age distribution among the insane 128 Punjab Mental Hospital 129 The Deaf and Dumb 130 Age distribution of deaf mutes 131 Local distribution of deaf mutes 132 The blind 133 Age distribution of the blind 134 Measures for combating blindness 135 Leprosy and its local distribution 136 Leprosy at different ages 137 Proportion of sexes among the leprous 138 Leper Asylums in the Province 139 Age distribution among different infirmities and total population 140 Comparison of the number of the infirm with other provinces 141 Sex proportion by age among the infirm

Reference to Statistics

The statistics relating to the four infirmities, insanity, deaf mutism, blindness and leprosy, by quinquennial age periods for the Province are given in Imperial Table IX, Part I, and totals for all ages by each district and state are given in Part II of the same table

Subsidiary Table I gives the number of the infirm per 100,000 of the total population of each sex for the whole Province, and each Natural Division, district and state

Subsidiary Table II gives the number of the infirm per 100,000 and females per 1,000 males at certain age periods for the whole Province

Subsidiary Table III gives age distribution of 10,000 infirm for the total Province

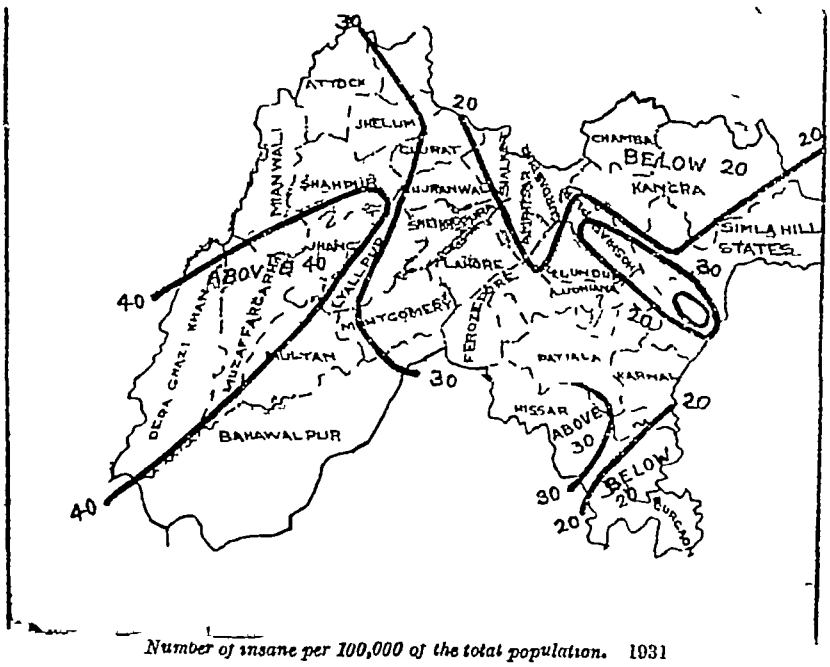

General

124 An enquiry which deals with the various aspects of the population, for instance, with the number of earners, working dependants and non-working dependants, would be incomplete if it did not make an attempt to estimate what proportion of the population suffers from some physical infirmity rendering it incapable of earning a livelihood In order to partially fulfil this purpose a column has been provided in the general schedule at each census to ascertain the number of persons, who are insane, deaf-mute, totally blind or leprous

The figures obtained as a result of this enquiry are given in Imperial Table IX, Parts I and II It may be remarked that the figures of infirmities are the least dependable of all the census figures as the presence of an infirmity, especially leprosy or insanity among females, is seldom given out The only figures comparatively reliable are those concerning blindness, an infirmity to which no stigma attaches, but here again sometimes persons with a weak eyesight or blind of one eye are returned as totally blind

Insane.

125 At this census 5,619 males and 2,720 females were recorded as insane in the Province These figures include the congenital idiots, known in some places as "*chuhas*" (literally meaning rats) owing to the shape and smallness of their heads and features, and those who become mentally deranged later in life The number of the insane appears to be very much smaller than it really is, as an infirmity of this type is kept carefully concealed, and strangers are unaware of its existence in a family unless it takes an acute form or the afflicted person becomes violent The figures of past censuses were, however, affected by similar drawbacks, and the results are therefore comparable

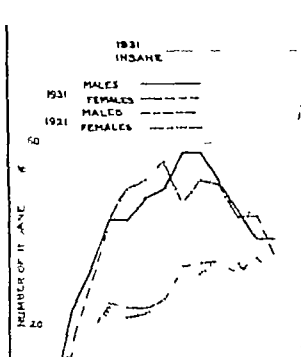

Number of insane per 100,000 of the total population. 1931

Local Distribution of Insanity

126 The map in the margin shows the local distribution of insanity in the Province, the number of the insane of both sexes per 100,000 of the total population of each area being illustrated The figures of Lahore Dis-

tract have been taken after excluding the inmates of the Lahore Mental Hospital born outside the district. It is apparent from the map that the highest number of insane persons is to be found in the Districts of Jhang Muzaffargarh and Dera Ghazi Khan. Poverty drug habit and some peculiarity of their hot climate may have their share but the main cause seems to be the practice prevailing among the inhabitants to marry within a limited circle of relationship Cousin marriages, if the process is repeated generation after generation, are in some cases directly responsible for imbecility and unsoundness of mind in children. The high proportion in some other predominantly Muslim districts also lends support to this view The proportion obtaining to the east of the isopleth showing 30 per 100 000 for the central Punjab is small except for an area of high proportion in Hoshiarpur District and the lower foot-hills of Kalsia. This area is also conspicuous for the smallest proportion of females, and there is possibly a connection between insanity and enforced sexual abstinence. That this is so is evidenced by the greater prevalence of insanity in youth and early manhood This result may also be partly due to better enumeration in these areas and partly to poverty The proportion in the other Sub-Himalayan districts and Kangra and Simla is the lowest being less than 20 per 100 000 of the total population. Hissar has a proportion of over 30 while a little more to the south-east the figures show an improvement

Sex Proportions and Age Distribution Among the Insane.

Number of insane per 100 000 of the population of each sex for each age period.

127 The graph in the margin shows the distribution of the insane by sex and age the number per 100 000 of each sex at various ages being given for 1931 and 1921

Like all other infirmities the number returned as insane is very small below the age of five but by the age of ten the imbecility of the children would be well established. The proportion then begins to rise steadily till the ages of 35—45 when it is about highest among males Afterwards it begins to fall rapidly among males while among females its decline is rather slow and the highest point is reached at 55—60 The proportions for the 1921 census are about the same and the nature of the two curves is similar except for minor variations due to the new process of smoothing the ages. The only difference at the

During the summer months the people of these localities suspend their bodies with all as protection against the evil effects of excessive heat.

present census is that the peaks of the curves have been slightly displaced The general tendency of the smaller proportion of the insane at young ages, the largest proportion obtaining in middle ages, and a rapid decline in old ages, is the same in both sets of curves The comparative difference between the male and female proportions also remains the same, and it is significant that among females the proportion of the insane is always lower than males, no doubt due partly to the concealment of the infirmity Among women too, an increase in the proportion is apparent till the age of 20, but between 20 and 30 the proportion drops slightly, indicating thereby that at this period of a woman's life she is well treated This particular drop in the proportion may be partly due to the increase in the number of able-bodied women at this age as a result of immigration The female proportion again begins to rise from 30 onwards and after remaining almost steady till 55 reaches the highest point at 55—60, dropping again for all ages over 60 This should cause no surprise as the ages of the insane have to be guessed by others, and as we know most persons are erratic even in stating their own age The higher proportion at comparatively older ages might be due partly to ill-treatment, to which old women are sometimes subjected

The drop in the proportion of the insane of both sexes at higher ages is accountable by the fact that insanity is a derangement found in the most youthful and the insane are for various reasons much shorter-lived than normal people

Punjab Mental Hospital

128 There is only one Mental Hospital in the Province, which is situated in Lahore In the margin is reproduced the average daily number of inmates of this hospital for each of the ten years, 1922—31 The figures show that on an average about 1,000 persons mentally unfit are looked after in this hospital Until recently accommodation had been much restricted, but the addition of a new section for criminals and another for women has relieved the congestion Some improvements in sanitation to ameliorate the health conditions have also been carried out Consequently the health statistics have steadily improved despite the increase in the number of patients, but even then mortality amounted to 10 39 per cent of the average daily population during the year 1929-30

Year	Total	Males	Females
1922	867	683	184
1923	900	710	190
1924	875	683	192
1925	865	681	184
1926	854	671	183
1927	890	705	185
1928	950	754	196
1929	1,011	802	209
1930	1,010	802	208
1931	993	772	221

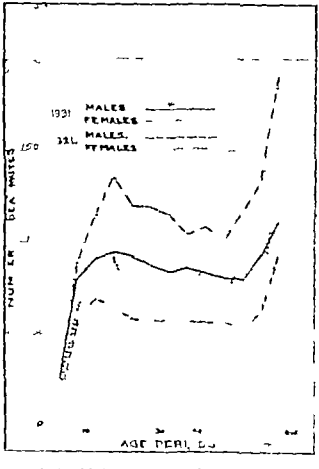

The treatment of the insane has now been brought into line, as far as possible, with modern methods Formerly all patients were removed to their cells or barracks for two or three hours during the hotter part of the day when their attendants were off duty, while violent cases were hardly allowed full liberty even within the precincts of their section and suicidal patients were kept locked in their cells at night A distinct improvement has been noticeable during the last decade All cases of acute melancholia and all patients exhibiting definite suicidal tendency are kept in an open hospital ward, with trained attendants on duty day and night While these measures cannot absolutely prevent suicides it is a fact that they have a salutary effect on the situation

The Deaf and Dumb

129 The deaf and dumb in the Province number 12,347 males and 7,185 females, as compared to 14,613 males and 8,145 females ten years ago There is thus a decrease in both sexes It was remarked in the last Census Report that some persons, who were weak of hearing only, had probably been included in the returns, especially at higher ages The intention was to

ascertain the number of the persons who were both deaf and dumb and the instructions to enumerators were made very clear on this point both in 1921 and now *The instructions appear to have been carried out more faithfully* on the present occasion.

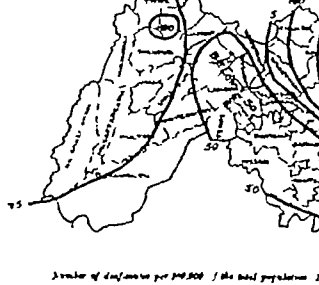

Age Distribution of Deaf-mutes.

Number of deaf-mutes per 100 000 of total population of each sex for each age-period.

120 The graph in the margin shows the age distribution of the deaf and dumb at this census and at the census of 1921 The proportion for both sexes has considerably fallen at all ages though it seems that the figures of ages after 35 have still been swollen by the inclusion of those who have lost their hearing or power of speech owing to extreme old age or a disease such as paralysis. In the earlier ages, of course the figures are for the most part made up of those born deaf and dumb The proportion as in the case of other infirmities rises up to the ages of 10—15 years but thereafter drops gradually till the age of 55 and again rises abruptly The drop in the proportion till the age of 55 shows that among those afflicted with this infirmity the rate of mortality is higher than in the rest of the population

Local Distribution of Deaf-mutes.

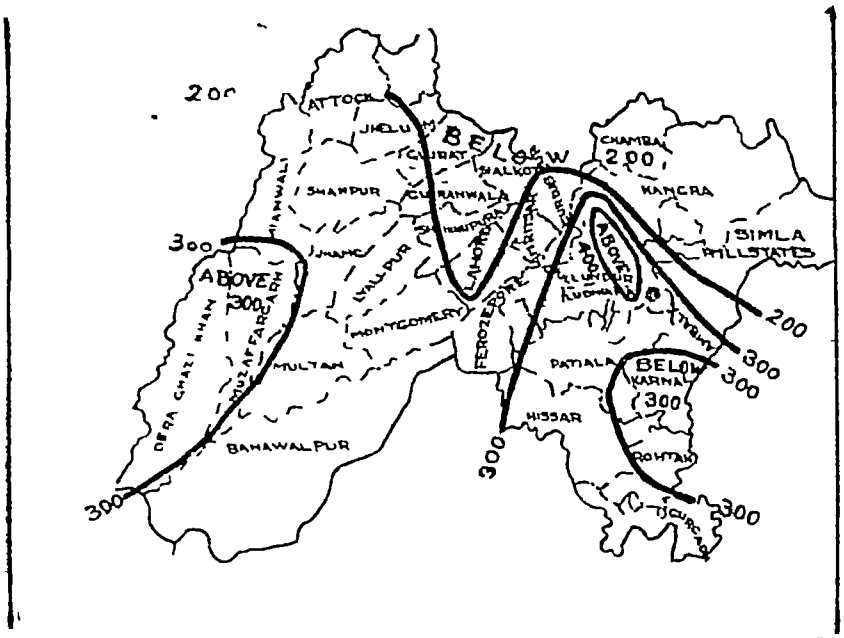

Number of deaf-mutes per 100 000 of the total population 1931.

121 The map in the margin shows the local distribution of deaf mutes The highest proportion is met with in the Himalayas the number ceases with rising altitud The prevalence of goitre in the

Himalayan areas has undoubtedly something to do with this infirmity, as also congenital syphilis The Indo-Gangetic Plain containing the greatest proportion of Hindu and Sikh population with the wider degree of exogamy has the lowest proportion The proportion in the western and predominantly Muslim districts is higher, the salt range area in Jhelum District showing a proportion of over 100 per 100,000 The high proportion in western districts might therefore have a good deal to do with the practice of cousin-marriage common among Muslims

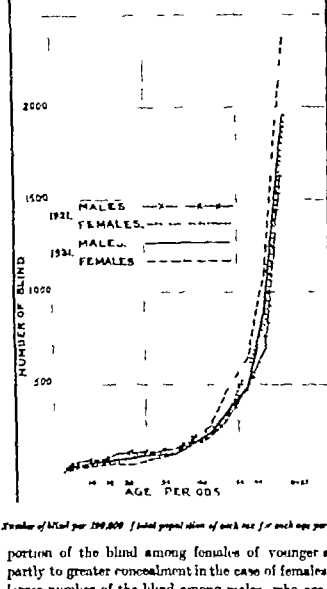

132 According to the returns there were 69,673 persons totally blind in the Province as against 65,051 ten years ago The increase is mainly due to the increase in the total population The number of blind females per 1,000 blind males is 876 **The Blind.**

Number of blind per 100,000 of the total population

The map in the margin shows the local distribution of the blind The proportion of the blind per 100,000 of the total population of each area is given It would appear that the greatest proportion of the blind is to be found in the Hoshiarpur District, mainly resulting from small-pox which according to the statistics available caused proportionately more deaths there during the last decade than in any other district Moreover, this district has got a particularly large proportion of the aged as is evident from the map on page 133, and old people as is well known are much more liable to lose their vision than others The Himalayan districts and states have the smallest proportion, as also Rawalpindi and the northern part of Attock District, evidently because of the cooler climate and comparative absence of dust The districts of eastern Punjab between the Sutlej and the Ghaggar have a higher proportion of blindness than those to the west The proportion in the south-west of the Province is again high, evidently due to the sand and dust and the strong glare of the sun

Age Distribution of the blind.

Number of blind per 100,000 of total population of each sex for each age period

133 The diagram in the margin shows the proportion of the blind per 100 000 of each sex at various ages for this census as well as the last. The number of those born blind seems to be very small and the fewness of blind children below 5 is mainly due to the refusal of fond parents to admit total blindness of their offspring while there is any hope of a cure The proportion up to ages of 30 rises slowly but steadily and afterwards begins to mount rapidly the curve becoming very steep after 5. when senility is undoubtedly the cause

The conditions for both sexes are similar with this difference that the curve for females keep lower than that of males up to the age of 35 when it crosses over indicating a smaller proportion of the blind among females of younger ages, which is attributable partly to greater concealment in the case of females, and partly to the genuinely larger number of the blind among males who are in the majority in the total population and are comparatively more exposed to accidents. The curve for females after crossing the curve for males at 35—40 keeps a higher level to the end

Measures for Combating blindness.

134 It will be evident from the diagram in the last paragraph that the proportion of the blind to the total population of both sexes has slightly risen since 1911 and considering that better means are now available to combat blindness the increase may be attributable to the improvement in enumeration at the present census

Year	Number of cataract operations performed	Year	Number of cataract operations performed	Year	Number of cataract operations performed
1	2	1	2	1	2
1901	8,704	1911	8,[illegible]	1921	11,417
1902	8,[illegible]	1912	12,663	1922	13,827

*Not available

figures for the three well-known centres, Moga, Amritsar and Gojra, are given in the margin for general interest

Leprosy and its Local Distribution.

135 The figures of leprosy are the least reliable, as it is a disease which the afflicted are anxious to conceal and in many cases can conceal successfully The instructions required the enumerators to distinguish between leucoderma and leprosy, and only to record the latter In a large number of cases an enumerator is not competent enough to make out the disease by merely looking at the sufferer, and in the case of females he has, as a rule, to depend on the version of a male member of the family It might therefore be pertinently asked why if the statistics of leprosy are so incomplete these are at all compiled at each census The answer to this question has already been given, and it may be added that with a better understanding of the object of a census, which is noticeable, an increasing measure of accuracy is being attained, moreover, the figures at any rate give the comparative local distribution of the infirmity, and those who are trying to eradicate it from the land are greatly assisted if they know in what localities their attention is most needed If it be admitted that the tendency to conceal this infirmity is uniformly strong in all parts of the Province the high proportion of lepers in a particular area will show that the number of sufferers there is comparatively larger than elsewhere At the same time it would become possible to locate the special cause of the disease in the particular locality

Proportion of lepers per 100,000 of the population

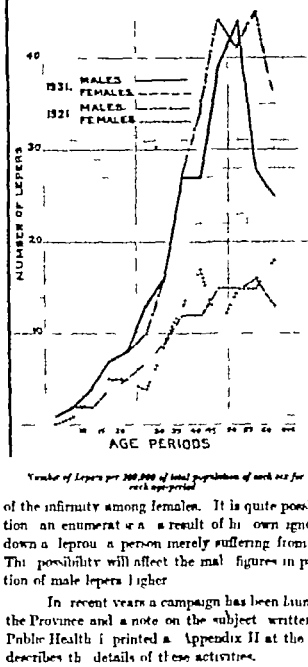

The map in the margin shows the local distribution of lepers, the number per 100,000 of total population of each area being shown The number of foreign-born inmates of leper asylumshas been excluded in each case

The proportion of the leprous is largest in the Himalayan Natural Division, the figures of Kangra (39) and Mandi (144) being the highest The affliction in the hill areas arises for the most part from the prevalence of venereal diseases The Ludhiana, Jullundur and Rawalpindi Districts and Bahawalpur State have the next highest proportion Most of the central districts as well as the

districts in the extreme north-west and the south-east across the Ghaggar show the smallest proportion.

Leprosy at Different Ages.

136 Let us now examine the number of lepers at different ages as compared to the total population at those ages. This proportion for the present census as well as the last is illustrated by the graph in the margin. We find that lepers form about the same proportion of the present population as they did ten years ago of the 1921 population. The proportion among both the sexes is also practically the same the 1931 curves being generally smoother. We notice that the maximum proportion of lepers is in the population aged between 40 and 55 years. It may therefore, be regarded as an infirmity of the middle aged, the small proportion of lepers among persons of over 50 indicating that lepers do not survive the age of 50 in considerable numbers.

Number of Lepers per 100,000 of total population of each sex for each age-period.

Proportion of Sexes among the Lepers.

137 It will have been noticed from the diagram above that proportionately fewer females are afflicted with leprosy than males. This disparity is partly due to greater concealment of the infirmity among females. It is quite possible that despite clear instruction an enumerator as a result of his own ignorance of the disease may put down a leprous person merely suffering from leucoderma yaws or syphilis. This possibility will affect the male figures in particular and raise the proportion of male lepers higher.

In recent years a campaign has been launched to eradicate leprosy from the Province and a note on the subject written specially by the Director of Public Health is printed as Appendix II at the end of this Report and briefly describes the details of these activities.

Leper Asylums in the Province.

138 In the margin is shown the number of patients in residence in the different asylums of the Province in 1931 and 1921. Admission to these asylums is voluntary and lepers are maintained and treated by specialists in the disease according to up-to-date methods and free of any charge. Any leper applying for admission is admitted if accommodation

Leper Asylum.	1931	1921
1	2	3
Pabalpur (Kangra District).	36	64
Sabathu (Simla District).	89	173
Tarn Taran (Amritsar District).	139	221
Ambala	105	69
Kasauli	32	143

is available, but in the case of Palampur those belonging to the Kangra District are given preference Similarly there is no compulsion for patients to stay in the asylums and they are at liberty to leave whenever they so desire The authorities, however, have the power not to re-admit those who have proved undesirables by previous misbehaviour Efforts are made as far as possible, to prevent migration of lepers from one asylum to another, because this necessitates their travelling in public carriages and endangering other passengers with possible infection

Age Distribution Among Different Infirmities and Total Population

139 The extent of prevalence of the various infirmities at various periods of life is clearly brought out by the table in the margin, in which the age distribution of 10,000 suffering from each infirmity is compared to the similar age distribution of the total population The highest proportion of the insane is found during adolescence and youth, that is from the ages of 10 to 35 years The proportion of deaf-mutes is greatest in childhood and goes on diminishing after the age of 15 The proportion of the blind rises with the years of age, while the leprous are most numerous in the middle age, *i e*, from 35 to 55

Age distribution of 10,000 of each sex.

Age.	Total Population		Insane.		Deaf mutes		Blind		Leprous	
	Males.	Females	Males	Females	Males.	Females	Males	Females	Males	Females

60 and over	525	460	573	684	738	709	4,298	4,405	1,021	1,015

Comparison of the Number of the Infirm with Other Provinces.

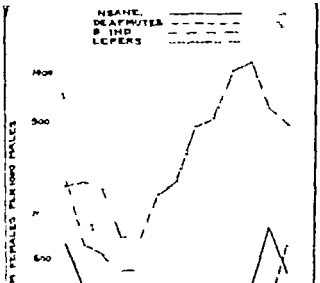

140 We can now compare the extent of the prevalence of the infirmities in this Province with that obtaining in some of the other Indian provinces and states The marginal table may be examined for this We find that the Punjab is very fortunate in respect of some of the infirmities It has got about the smallest number of the insane and lepers The number of blind is, however, very high, being only exceeded in the sandy tracts of Ajmer-Merwara and Rajputana Agency The deaf-mutes are most numerous in Kashmir, which adjoins our Himalayan Division, and it would not be improper therefore to repeat that the altitude and climate and congenital syphilis are greatly responsible for this affliction As regards leprosy, only Ajmer-Merwara, Baluchistan and N W F Province have an advantage over the Punjab The areas, which are the worst off in this respect, are Burma, Assam and Kashmir

Infirm per 100,000 of the total population

Serial No.	Province or State.	Insane	Deaf mutes.	Blind.	Lepers
1	Punjab	29	69	245	10
2	N W F Province	31	66	102	10

8	Burma	88	116	189	76
9	Assam	59	75	107	60

Sex Proportion by Age Among the Infirm.

141 An idea of the sex proportion among the infirm could be formed from the curves of the present age distribution of each sex a reference to which was made in some of the preceding paragraphs There however was shown the proportion of the infirm in the total popula tion of each sex at various ages. The dia gram in the margin gives the number of females suffering from each in firmity per 1 000 male sufferers at each age-period The most pro minent feature of these curves is that the propor tion of females is every where less than 1 000 except that in the case of the blind females of 45—50 and 70—55 are in excess of the males. All the other curves in cluding the one for the blind show a drop sharp or gradual at the ages of marriage which is an indication of the need for concealment at these ages.

Number of infirm females per 1,000 males by age-periods.

SUBSIDIARY TABLE I

CHAPTER VIII

OCCUPATIONS OR MEANS OF LIVELIHOOD

SECTION I.—GENERAL.

141. Instructions about the return of occupations. 142. Changes in instructions since 1921. 144. Classification of occupations. 145. Comparison with the figures of last census. 146. Earners and working dependants. 147 Female workers. 148. Subsidiary occupations. 149. Comparison of the population of workers with other provinces. 150. Distribution of non-working dependants.

SECTION II.—DETAILED EXAMINATION OF OCCUPATIONS.

151 Detailed examination of occupational distribution. 152. Cultivation. 153. Cultivating owners and tenants. 154. Agricultural labourers. 155. Cultivating owners and co-sharers in holdings. 156. Cultivators of special crops. 157. Stock-raising. 158. Birds and bees. 159. Order 2 Fishing. 160. Sub-Class II, Order 3, Exploitation of Minerals. 161. Class B. 162. Sub-Class III, Industry 163. Sub-Class IV Transport. 164 Sub-Class V Trade. 165. Class C, Administration; Public Force. 166. Service of the State 167 Professions and Liberal Arts. 168. Class D Miscellaneous. 169 Beggars and vagrants.

SECTION III.—OCCUPATIONS OF SELECTED CASTES.

170 Occupations of selected castes. 171. Occupations of Brahmans. 172. Female workers in each caste.

SECTION IV.—EDUCATED UNEMPLOYMENT.

172 Educated unemployment.

Reference to Statistics.

The main statistics of occupations for the total population will be found in Imperial Table X.

Imperial Table XI furnishes particulars of occupations followed by members of certain selected castes or tribes as well as Europeans, Armenians and Anglo-Indians in areas where they are numerous. In this table the occupations are arranged under 12 main heads which closely correspond to the sub-classes in the general scheme of classification.

In addition to these tables, there are six Subsidiary Tables appended to this Chapter as mentioned below

Subsidiary Table I ( ) gives, for the Province as a whole, the number of workers per 10,000 of the total population, engaged in each occupation falling under each class, sub-class and order recorded in cities and the whole Province excluding cities together with their percentage.

Subsidiary Table I (b) gives the same information as Subsidiary Table I ( ) for subsidiary occupation of earners only

Subsidiary Table II ( ) gives for each Natural Division, District and State the number of non-working dependants, working dependants and earners (principal occupation) out of every 10,000 persons as well as the number *per* mille of the total population, of earners (principal occupation) falling under 12 main sub-classes.

Subsidiary Table II (b) gives the number of earners with subsidiary occupations *per* mille of the total population in each of the 12 main sub-class for the Indo Province and each Natural Division separately

Subsidiary Table III gives the number of female workers (earners and working dependants) per 1,000 males following occupations grouped into sub-classes, orders and certain selected groups, the groups selected being those in which either the proportion of women employed or the total number of workers is large

Subsidiary Table IV gives comparative figures of actual workers in selected occupations for 1921 and 1931 with percentage of variation.

Subsidiary Table V gives, for selected castes, the distribution of 1,000 earners (principal occupation) in different occupations and the number of female earners per 100 males in each.

Subsidiary Table VI gives the number of persons (Europeans, Anglo-Indians and Indians according to departmental returns) employed in ( ) Railways, (b) Irrigation Department, and (c) Post, Telegraph and Telephone Services.

SECTION I.—GENERAL.

Instructions About the Return of Occupations.

142 This Chapter deals with the important question of the occupations or the means of livelihood of the population of the Province. There were three columns in the general schedule relating to occupations. The instructions to enumerators with regard to filling up these were —

Column 9 (*Earner or Dependant*)—Enter earner or dependant." A woman who does house work is a dependant so is a son who works in the fields but does not earn separate wages. A cultivator cultivating as a principal occupation is an earner

Column 10 (*Principal occupation of earners*)—Enter the principal means of livelihood of all persons who actually work or carry on business, whether personally or by means of servants or who live on house-rent pension, etc Enter the exact occupation and avoid vague terms such as service or writing or labour For example in the case of labour say whether in the fields or in a coal mine or in cotton mill or earthwork etc. In the case of agriculture distinguish between persons (whether owners or tenants) who do not cultivate personally who cultivate their own land who cultivate rented land and who are hired labourers If a person makes the articles he sells he should be entered as "maker and seller of them. *Women and children who work at a y occupation which helps to augment the family income indirectly must be entered in column* 9 *as dependants and their subsidiary occupation shown in column* 11 For non-working dependants make a × in columns 10 and 11

Column 11 (*Subsidiary occupation of actual workers*)—Enter here any occupation which actual workers pursue at any time of the year in addition to their principal occupation Thus if a person lives principally by his earnings as a boatman, but partly also by fishing, the word 'boatman' will be entered in column 10 and 'fisherman' in column 11 If an actual worker has no additional occupation a cross (×) will be put in column 11 Dependants who help to support the family by subsidiary work, *e g*, a woman who helps in the fields will be shown in this column

The instructions were amplified by the following provisions in the Census Code —

Columns 9 *to* 11 —The entry of occupation in columns 9 to 11 is also a matter requiring special care The first thing is to distinguish between an earner and a dependant Only those women and children will be entered as earners who help to augment the family income by permanent and regular work for which a return is obtained in cash or kind Thus a woman, whose sole business is to look after her husband's house and prepare his meal, should go in as a dependant and not as an earner, but a woman, who habitually collects and sells firewood or cowdung, thereby adds to the family income and should be shown as an earner A boy, who sometimes looks after his father's cattle, is a dependant, but one who is a regular cowherd and thus earns a wage in cash or kind should be recorded as an earner in column 9 and a cowherd in column 10 As a rough and ready rule it may be assumed that boys and girls over the age of 10, who actually do field labour or tend cattle, are adding to the family income and should therefore be entered in column 10 or 11 according to whether they earn pay or not Boys at school and college should be shown as dependants, though they may help to pay their own way by private tuition, in this case, *i e*, "private tuition" will be entered in column 11 against their names Dependants who assist in the work of the family and contribute to its support without actually earning wages should be shown as dependants in column 9 and under subsidiary occupation in column 11 Thus a woman who regularly works in the fields for her husband is a dependant and should be entered as such in column 9, but has the subsidiary occupation of cultivation, which will be recorded in column 11 Household work, done by a woman in her house, will not count as a subsidiary occupation Women and children, who are doing no manual work, should be entered as 'dependants' in column 9 but not at all in either column 10 or 11

Domestic servants must be entered in column 9 as earners, not dependants, and in column 10 as cook, *bahishti*, etc

Persons temporarily out of employ should be shown in column 9 as earners and in column 10 as following their previous occupation

When a man has two occupations, the principal one is that on which he relies mainly for his support and from which he gets the major part of his income A subsidiary occupation should be entered if followed at any time of the year (whether followed throughout the year or during a part of it) For instance, if a man is a potter by profession but he does the work of date-picker in the date season, the entry in column 10 should be potter and that in column 11 date-picker (*charha*) And if a man is a shopkeeper but keeps making mats in his spare time, the two occupations should be entered in columns 10 and 11, respectively

Only one subsidiary occupation (the most important one) should be entered in column 11

Persons living on agriculture must be distinguished as rent-receivers (*i.e.* non-cultivating owners, and lessees and tenants who have sub-let their land) cultivating owners, cultivating tenants or agricultural labourers. Where a person cultivates part of his land and sub-lets part, he should be shown in column 10 as cultivator and in column 11 as rent receiver if he gets the greater part of his income from the self-cultivated land, and vice versa otherwise. If such a person has a third profitable source of income, as, for instance legal or medical work, then that source from which he derives the greatest part of his income will be entered in column 10 that source from which he derives the next greatest part of his income in column 11 whilst the third source of income (whichever it may be) will not be shown. Gardeners or growers of special products, such as vegetables, mangoes, etc must be shown separately Persons whose income is derived from the rent of houses or land in towns should be distinguished from those who derive it from agricultural land, their occupation being noted as house-rent (*kiraya makan*) etc.

Persons who have mortgaged their land with possession and derive no profit therefrom are not agriculturists in respect of that land. Agricultural labourers should be distinguished from tenants the former receive their wage in cash or kind the latter pay rent (*batai* or cash) to the landlord.

Stress must be laid on the importance of avoiding vague words like labour" or service or shopkeeping The enumerator must enter the exact kind of labour or service and the nature of the goods sold. In the case of service, it is necessary not merely to distinguish Government service Railway service, Municipal service, Village service service in a shop or office and domestic service, etc., but also to show the exact occupation followed *e.g* in the case of Government service whether Collector or Army Officer or Civil Court Clerk or Police Inspector Patwari, Constable etc. in the case of Railway service — Engine-driver Stationmaster in Municipal service —Octroi Moharrir Sanitary Inspector in Village Service —Chaukidar etc In the case of clerks the occupation of their employer must also be shown *e.g.*, lawyer's clerk Bank clerk, *Sahukar ka gumashta*

Whenever large gangs of coolies are employed on earthwork of any kind special instruction should be given to the enumerators to enter not only the word earth-work but also the nature of the undertaking (railway road canal, etc.) in connection with which it is being done Pensioners should be shown Civil Military or Political, as the case may be

For shopkeepers and traders the nature of the articles sold should be stated, *e.g* general merchant "cloth merchant seller of food-stuff In the case of industries the precise nature of the industry should be given as cotton weaver carpet maker silk weaver "maker of glass bangles.

Mortgagee and persons who live mainly on money lent at interest, or on stocks, bonds or other securities such as shares in companies should be entered as capitalist (*sahukars*)

Persons who live by the receipt of alms should be recorded as religious mendicants professional beggars vagrants et ., as the case may be.

The above instructions in the Col were supplemented during the period of enumeration by means of circular letters, dealing with the mistakes which came to my notice in the course of my inspection in various districts and states Some of these are quoted below

(a) A person was entered a carrier" in column 9 and his occupation was shown in column 11 and not in column 10 In carrier's occupation or

source of income *must* be entered in column 10, and if he has a second occupation that should be entered in column 11

(*b*) In some cases an earner's occupation was entered as cultivation (*kasht-kari*) I have always tried to emphasize the fact that agriculturists are divided into four groups, *viz*, (1) cultivating owner (*malik khud-kasht*), (2) rent receiver (*lagan-girindah*), (3) tenant (*muzara*) and (4) agricultural labourer (*zaraati mazdur*) Earners must belong to one of these groups, and the particular name of the group should be noted in the column of occupation as the case may be For dependants, who assist the family by cultivating land, the entry in column 11 should be "cultivation"

(*c*) One patwari had put down a dependant as *zaraati mazdur* (agricultural labourer) in column 11 If a person is an agricultural labourer, which means that he receives a wage, he must go in as "earner" and not as "dependant" Evidently the entry in this case should have been "cultivation" and not "agricultural labourer"

(*d*) In some cases an earner was put down as *lagan-dahinda* As pointed out in clause (*b*) above the entry should be *muzara* (tenant) In another case I noticed that the entry about an earner in column 10 was *thekedar* (lessee) There is no such group of agriculturists, and the proper entry should have been *lagan girindah* if the lessee did not cultivate the land himself, and a *muzara* if he was himself the cultivator

(*e*) In a few cases the grown up sons of a land-owner were entered as earners in column 9 and *malik khud-kasht* or *muzara* in column 10 The entry about them should have been "dependant" in column 9 and "cultivation" in column 11 If however a land-owner's son is living separately from his father and cultivates a piece of land, which his father has set apart for him, he should be shown in column 9 as earner and in column 10 as *malik khud-kasht*

(*f*) In a few cases I noticed that the entry in column 10 was merely "*dukan*" It has been pointed out in the instructions that the entry in the column of occupation must be clear and comprehensive It should clearly state, in the case of shopkeepers, what shop or trade is theirs, *e g*, cloth merchant, general merchant, broker, etc Similarly, I found that a man was entered in column 10 as *chowkidar* About him too it should be specified whether he is a village *chowkidar* or *chowkidar* of a Rest House or *chowkidar* of a Bank *Chowkidar* by itself is not an adequate entry

(*g*) In one case a patwari entered as "dependant" a child, who had inherited his father's land and was therefore obviously possessed of a source of income, *i e*, rent-receiving He should have been entered as "rent-receiver" if his land was being cultivated by tenants, and "cultivating owner" (*malik khud-kasht*) if his land was cultivated by a relative of his, who did not pay any rent, or by an agricultural labourer

(*h*) In several cases I found that a person's occupation, shown in column 10, was repeated in column 12, which is solely meant for employees in factories, companies or other organized industries For example, a village *mochi* was entered as such in column 10 as well as in column 12

Changes in Instructions since 1921

143 Before explaining the data collected about occupations it seems preferable to deal with the points in which the present returns differ from those of 1921 Three columns (9, 10 and 11) were provided in the general schedule at last census, column 9 for principal occupation of workers, column 10 for their subsidiary occupation (if any) and column 11 for the means of subsistence of a

dependant. The instructions about the filling-up of each column were as follows —

Column 9 (*Principal occupation of actual workers*) —Enter the principal means of livelihood of all persons who actually do work or carry on business, whether personally or by means of servants, or who live on house-rent, pension, etc. Enter the exact occupation and avoid vague terms such as service or writing or labour For example in the case of labour say whether in the fields, or in a coal mine or jute factory or cotton mill or lac factory or earthwork, etc. In the case of agriculture distinguish between persons who receive rent and those who pay rent, *i.e.*, between *Malik* and *Mucara* If a person makes the articles he sells he should be entered as maker and seller of them. Women and children who work at any occupation which helps to augment the family income must be entered in column 9 under that occupation and not in column 11 Column 9 will be blank for dependants.

Column 10 (*Subsidiary occupation of actual workers*) —Enter here any occupation which actual workers pursue at any time of the year in addition to their principal occupation. Thus if a person lives principally by his earnings as a boatman but partly also by fishing, the word boatman will be entered in column 9 and fisherman in column 10 If an actual worker has no additional occupation, enter in column 10 the word none This column will be blank for dependants.

Column 11 (*means of subsistence of dependants*) —For children and women and old or infirm persons who do not work, either personally or by means of servants enter the principal occupation of the person who supports them. The column will be blank for actual workers.

It will be seen that in place of workers we have now earners and working dependants. The definition of earner has been framed so as to include those only who receive a wage or salary or derive an income from property or money investment. Under this definition even an infant, who has income from house-rent, rent of land or from shares or a fixed deposit in a bank is an earner The majority of women and children, who work and augment the family income only indirectly are classed as working dependants only those who work regularly in the fields or in the case of boys, who earn a separate wage as agricultural labourers or cowherds, are recorded as earners. In the case of non-working dependants the means of subsistence or in other words the occupation of the person on whom they depend has been omitted altogether

Another departure made at the present census is that all occupations followed by earners as subsidiary to the main occupation have been tabulated and not merely the number of workers who were partly agriculturists in addition to some other occupation as their principal means of livelihood as was the case at last census.

The net result is that in 1901 were tabulated the figures of workers of both sexes engaged in each occupation as well as the number of those who depended upon them. The number of workers engaged in each occupation with agriculture as subsidiary means of livelihood was also tabulated.

At this census we have tabulated the number of persons who are earners working dependants engaged in different occupations, non-working dependants and earners who follow an occupation subsidiary to some other In other words the present figures give a greater detail about workers than was possibl in 1901 but the number of non working dependants supported by each occupation l not available This information is however of minor im

portance as compared with a better classification of workers The classification of non-working dependants besides entailing a very great amount of labour, had another defect inasmuch as in some cases these seem to have been unwittingly included in workers A reference will be made to this presently after the method of classification of occupations adopted at this census has been described *

144 The system of classification adopted at this census which has been practically the same since 1911 was to divide the thousands of occupations met with in actual life into 4 Classes, 12 Sub-classes 55 Orders and 195 Groups The classes and sub-classes have remained unchanged since 1911, but there have been slight modifications in the number of orders and groups At the 1921 census there were 56 Orders and reduction in their number by one in 1931 was due to the amalgamation of the three Orders of 'mines' 'quarries of hard rock,' and 'salt' into two Orders of 'metallic and 'non-metallic minerals' The number of groups has been increased from 191 to 195, mainly to improve the classification by the separation of certain occupations having no essential connection, or by amalgamating others

Classification of Occupations.

The names of the Classes and Sub-classes are given below —

Classes	Sub-classes	
A —PRODUCTION OF RAW MATERIALS	1	Exploitation of animals and vegetation
	2	Exploitation of minerals
B —PREPARATION AND SUPPLY OF MATERIAL SUBSTANCES	3	Industry
	4	Transport
	5	Trade
C.—PUBLIC ADMINISTRATION AND LIBERAL ARTS	6	Public Force
	7	Public Administration
	8	Professions and Liberal Arts
D —MISCELLANEOUS	9	Persons living on their income
	10	Domestic service
	11	Insufficiently described occupations
	12	Unproductive

It may be mentioned that the compilation of the occupations table is one of the most difficult of all the census undertakings An elaborate revised index showing the classification of all occupations returned at former censuses was made available in the Administrative Volume of 1921, while the Census Commissioner for India supplied another index It will, however, be admitted that no index could be exhaustive enough adequately to provide for the diversity of the returns that were met with at the time of sorting The entries not only depend on the fancy of the persons questioned but also on that of the enumerator However complete the training, to which the huge army of enumerators is subjected, it is not possible to suppress individual freaks altogether As a result some of the most amusing occupations were recorded In some cases the columns of occupation contained such entries as 'school-boy' and '*godka*,' a most unusual term which meant an infant in arms and gave any amount of trouble to the establishment of the sorting office to decipher Even the wives of British Army officers were found to have returned the occupation of their husbands such as 'Captain in the Army' or just 'husband' In some cases the entry about political prisoners or Europeans in the column of occupation was 'refuses to disclose further particulars' Sometimes the occupation recorded was 'guest,' and a new departure made at this census was the entry of 'Congress,' 'National Worker,' 'Volunteer,' or 'Bande Matram' as the occupation of an earner These cases are quoted to give an idea of the entries which are met with and which are more or less unavoidable The total number of such entries is however small, and even if some returns have been wrongly recorded the final results of the census could not be materially

* The total non working population of the Province and each of its units can be ascertained by subtracting the workers (earners principal occupation and working dependants) from the total population

affected by the few queer returns like these. Every attempt has been made to classify the new occupations, and the revised index of occupations will be found in Part IV of this Volume.

Comparison with the Figures of Last Census.

145 In spite of the changes in instructions described above, the figures of occupations are on the whole comparable with those of 1921 Thus for example 58 5 per cent of the male and 9·1 per cent. of the female population were recorded as workers in 1921 the percentage of earners and working dependants in 1931 is 57 9 among males and 11 5 among females. The figures correspond as closely as could be expected. The small decrease in the proportion of male workers may be explained by the large increase in the number of children. The proportion of female workers has on the whole increased and is accountable by the large increase in the number of females engaged in class A, particularly agriculture, as we shall presently see

We can now take the absolute figures (British Territory) of classes B and C, where the proportion of female workers is small to show that some non working dependants were included among workers in 1921 The table in the margin gives the number of workers in 1921 by sex as well as the number of earners and working dependants in 1931 We find that there is a decrease in females employed in both classes. The figures of males show a normal increase during the last decade while there was no reason for the female figures to decline as females in many places are believed at present to be taking a more active part in bread winning The decrease in the number of female workers therefore must be due to the inclusion of some non working dependants in the workers of 1921 The entry about occupation for both worker and dependant was the same in the case of the latter was to be entered the occupation of the worker on whom he or she depended. These entries in their turn were copied in adjoining columns of a small slip and there was thus a chance for a mistake to creep in.

Occupation.	Total earners and working dependants, 1931.	Total workers 1921.	Variation Increase (+) or decrease (−).
Class B.			
Both sexes	2,290,002	2,218,981	+71,021
Males	2,016,497	1,883,488	+133,009
Females	273,505	335,493	−61,988
Class C.			
Both sexes	339,273	338,147	+1,126
Males	319,384	310,236	+9,148
Females	19,889	27,977	−8,088

We can now compare the number of workers of 1921 with the number of earners and working dependants engaged in different occupations at this census In 1921 there were 8 070,030 male and 1 035 971 female workers. There are at this census 7 980 049 males and 536 041 females recorded as earners while 1 027 900 males and 918 610 females are recorded as working dependants giving 9 007,949 males and 1 454—31 females as actual workers The case of earners with a subsidiary occupation will be dealt with at a later stage The table in the margin shows the division of 1,000 workers into the various classes and sub-classes of occupations at the two censuses Sub-class I has been further divided into main heads to show the results in somewhat greater detail

The distribution of 1,000 workers (both sexes).

Occupation.	1921.	1931.
1	2	3

VIII.—*Professions and Liberal Arts*	23	21
D.—Miscellaneous	79	73
IX.—*Persons living on their income*	3	3
X.—*Domestic service*	31	24
XI.—*Insufficiently described occupations*	24	23
XII.—*Unpaid work*	20	21

The overwhelming importance of agriculture as an occupation in a Province like the Punjab is self-evident The disconcerting feature is that the number of workers engaged in cultivation has increased from 560 *per mille* of workers in 1921 to 608 now To these figures is to be added a small number of persons returned in class D 'Miscellaneous' to which we will revert in paragraph 154 Besides this, 24 *per mille* as against 23 in 1921 are now engaged in stock-raising

There is a regrettable decrease in the proportion of those employed in Industry and Trade though the result is partially due to the accidental inclusion of non-working women in the figures of 1921 as explained above There is an increase under 'Transport' though it will be realised how small a proportion of workers are engaged in it as compared with those engaged in 'trade' or 'industry' It seems that 'transport' which has been very much in the public eye gives a false impression as to its size or the rate of its increase There is a fairly large increase in the absolute figures, no doubt, but not at a rate out of all proportion to other progressive occupations As compared to this the increase in the number of persons employed in agriculture is really enormous This increase remains more or less unnoticed, being for more reasons than one of an unobtrusive character, and is only brought out by a periodical census

In the next class, namely, C-Public Administration and Liberal Arts, there is a small reduction primarily due to the demobilization of a considerable portion of the Army carried out during the last decade The proportion in Public Administration proper shows an increase This sub-class has increased by 3 *per mille* of workers, and represents the real expansion made in all the departments of the State during the last ten years, a period which was one of great prosperity except towards the close

Of the miscellaneous professions there is a big decrease in domestic service, due probably to better classification and also perhaps to the need for economy felt by all well-to-do people since the recent economic depression set in There is a welcome decrease in insufficiently described occupations, and here the results of certain districts are very much better than of others owing to the varying degrees of care with which the work was done There is also a considerable decrease in the proportion of persons engaged on non-productive industries

146 We may now examine briefly how the number of earners compares with that of working dependants In the marginal table is given the distribution of 1,000 'workers' between earners and working dependants, engaged in different occupations In other words this is merely a further splitting up of the figures in column 3 of the table in paragraph above Thus out of 1,000 workers, that is earners and working dependants, 812 are earners as against 188 working dependants The table also indicates that the

Earners and Working Dependants

Distribution of 1,000 earners and working dependants in 1931

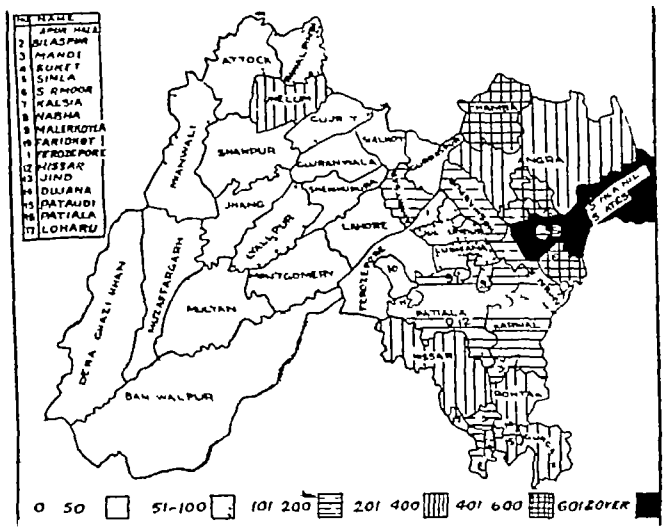

Occupation	Earners	Working dependants
TOTAL (All Occupations)	812	188
A—Production of Raw Materials	*476*	*161*
I.—*Exploitation of animals and vegetation*	475	160
(a) Cultivation	454	154
(b) Cultivation of special crops	1	
(c) Forestry	2	
(d) Stock raising	17	7
II.—*Exploitation of Minerals*	1	
B—Preparation and Supply of Material Substances	*230*	*21*

IX.—*Persons living on their income*	3	
X.—*Domestic service*	24	2
XI—*Insufficiently described occupations*	22	1
XII—*Unproductive*	19	2

bulk of working dependants is engaged in Cultivation (81 6 per cent) and the majority of the rest in Industry (9 per cent.) and Stock raising (3 6 per cent) In other occupations such as trade and domestic service there are very few working dependants. and practically none in transport and Public Administration. The ratio of females to males among working dependants is as high as 923 *per mille* while among earners it is no more than 6 *per mille*

It is sometimes not at all easy to draw a line between working dependants and earners. For instance the proportion of working dependants in the total population of Jammu and Kashmir (see table in paragraph 148) is greater than the proportion of earners themselves This difficulty is partly due to the habit in this country on the part of joint families to return only the head of the family as the earner Even the grown-up sons of a family employed in various occupations. in numerous cases hand over their earnings to the head of the family receiving occasionally sums of money to meet their own expenses. This applies with particular force to the children of cultivators in cases in which the father owns the land and the sons merely cultivate the fields as working dependants Though every endeavour was made, as is apparent from the extracts given in the first paragraph of this Chapter to obtain uniformity in the return of occupations the results of certain areas are slightly affected by the differences in the interpretation of the instructions on the subject. Separate entries for working dependants are however not valueless as they show within reasonable limits, the extent of the share taken in bread winning by the women and children in different areas A clearer view of this will, however be obtained if we confine ourselves to a study of the local distribution of women workers.

Female Workers.

147 The bulk of the female population of this Province is undoubtedly constantly engaged in numerous kinds of work which comprise among other duties cleaning and plastering the house bringing up children cooking milking of cows and buffaloes, spinning sewing and mending of clothes agricultural labour embroidery of clothes and shoes, etc All these activities though of the utmost importance would be regarded at the census as no work at all and the women engaged in them would be treated as non working dependants. The rule that the producers of economic utility alone should be treated as workers is, however very difficult to interpret and apply A reference to this was made in the following quotation reproduced from the India Census Report of 1921 (page 236 paragraph 202) "The distribution between worker and dependant and between primary and subsidiary occupation involves subtleties of interpretation which continually gave trouble in individual cases, and the extent to which the occupations of women and children actually contribute to the income of the family must always be a matter of opinion and give rise to inconsistencies in the return. The work of classification is further hampered by the different attitud in different areas of the people and enumerator towards the dignity of labour Further it is not at all easy to choose the principal occupation of working dependant who are often engaged in various kinds of work at different periods of the year On the whole even if the matter of classification is regarded as giving too small or too high a proportion of female workers the results obtained are of some value as an indication of the relative share in economic work now taken by women as a

Number of female workers per 1,000 of total females

compared with the past, or in different parts of the Province and in different occupations We shall deal first with the second of the three possible avenues of enquiry The marginal map shows the number of female workers *per mille* of total females in each district or state It can be safely said that proportionately a larger number of women are engaged in economic work in the Himalayan Natural Division than in the plains, and that in the latter the women of south-eastern districts such as Hissar, Rohtak and Gurgaon, take a greater share in such work than the women of the central districts with one or two exceptions and the districts and states of the south-west In the Himalayas as well as in the south-east of the Province women take a large share in agricultural work, and in some localities are believed to do it even better than their husbands Women of the north-western districts are also fairly active workers

Subsidiary Table III at the end of this Chapter gives the proportion of female workers engaged in important occupations per 1,000 males similarly engaged In the margin are given the absolute figures as well as proportions for certain groups, in which there are more than 500 female workers per 1,000 males There are thus actually more female workers in the three groups, (71) flour grinder, etc , (72) grain parchers, etc , and (172) mid-wives, etc In the work of scavenging too females have a large share, partly because in numerous households they are employed in preference to men, and partly because a male sweeper very often takes up odd jobs, particularly agricultural

Group No	Occupation	Absolute figures of female workers	Number of females per 1 000 male workers
1	2	3	4
15	Tea	493	504
19	Collectors of forest products	1,121	830
46	Wool carding, spinning and weaving	1,051	506
50	Lace, crepe, embroideries, fringes, etc., and insufficiently described textile industries	485	734
71	Rice pounders and huskers and flour grinders	12,754	1,455
72	Grain parchers, etc.	8,106	1,145
81	Others	6,687	566
	Order 17, Miscellaneous and unclassified industries	111,701	559
100	Scavenging	110,219	826
172	Midwives, vaccinators, compounders, nurses, masseurs	7,958	1,856
194.	Procurers and prostitutes	1,142	5,031

148 As noted in the first paragraph of this Chapter the instructions required the enumerators to record in column 11 the subsidiary occupation of earners If an earner had several subsidiary occupations only the most lucrative was to be entered This choice having perforce been left to the person enumerated would to some extent affect the returns of principal occupations, as for instance a police constable may return his principal occupation as rent-receiver and his subsidiary occupation as policeman Thus the total number of persons engaged in police service can only be obtained by adding the figures of those

Subsidiary Occupations.

who have returned police service as their principal as well as of those who have returned it as their subsidiary occupation. As a matter of fact Public Administration has been recorded as a subsidiary occupation of very few persons which indicates that either the salary of a public servant is his principal means of livelihood or he considers it more dignified to return public service as his principal occupation. In some cases though he is deriving a larger income from trade a public servant will take care not to return it as an occupation, being debarred from trading by the rules of his service. The chief occupations followed by earners as subsidiary to some others are cultivation industry or trade. Subsidiary Table I at the end of this Chapter shows the number of earners having some subsidiary occupation per 10 000 of the total population. An extract from this table in respect of the important occupations is given in the margin similar proportion for earners with principal occupations being added. These figures imply that if the whole population of the Province were assumed as 10 000 persons, 289 of them would be earners with some subsidiary occupation 171 45 and 20 being earners with agriculture, industry and trade as their subsidiary occupations, respectively. Compared to these there would in all be 2,989 persons who are earners with one occupation, or in another way out of every 10 000 earners only 968 have some subsidiary occupation. The ratio of females to 1 000 males among earners with some subsidiary occupation is 46 as compared to 67 among total earners.

For 10,000 of the total population.

Occupation.	Earners principal occupation.	Earners subsidiary occupation.
All occupations	2,989	289
Cultivation	1,672	171
Industry	986	45
Trade	204	20

In the detailed examination of occupations which we shall undertake in section 2 only workers who have returned each occupation as their principal means of livelihood will be referred to or be designated along with the working dependants as workers, except in certain important cases, in which the number of persons following it as a subsidiary occupation will be particularly mentioned.

Comparison of the Population of Workers with other Provinces.

140 Before we take up further examination of the figures of earners with principal occupations and working dependants it will be of interest to know the proportion of these in the total population of the Province and to compare it with similar proportions in other provinces. Such comparison is afforded by the figures in the marginal table

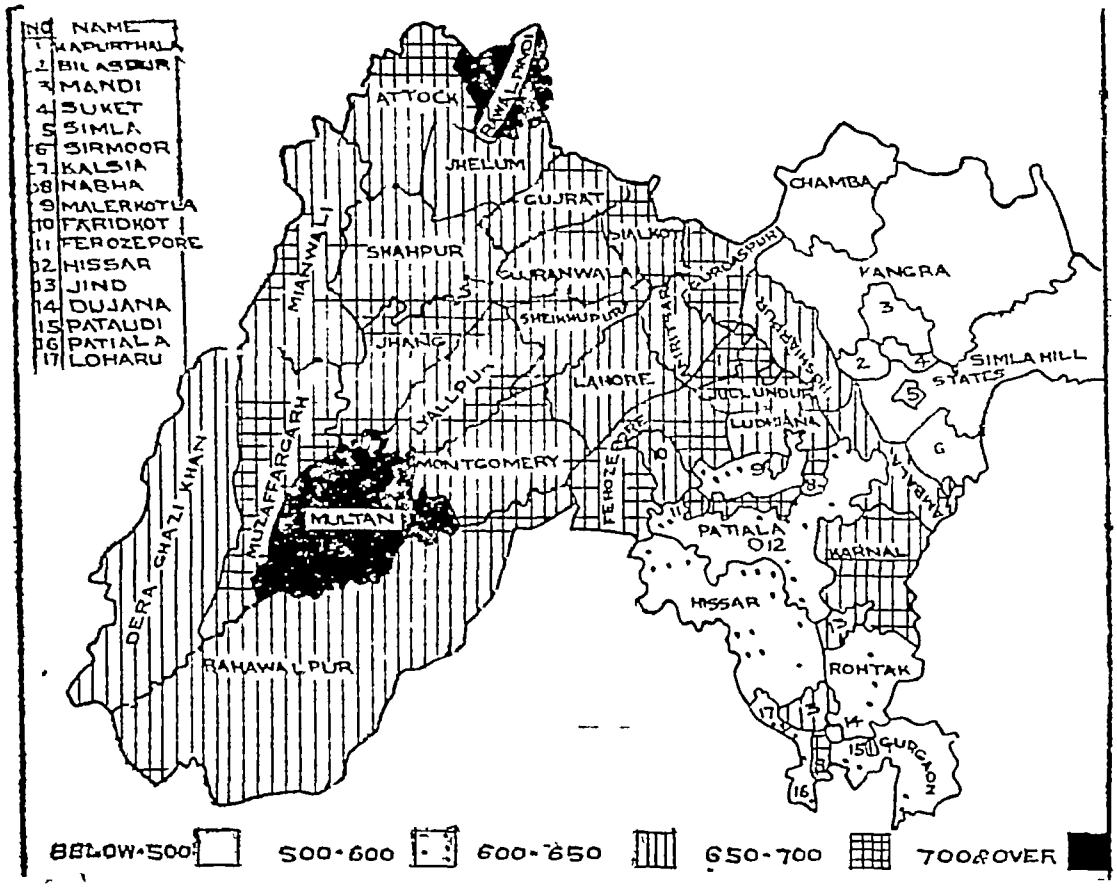

Number per 1,000 of total Population		Punjab.	N.-W. F. P.	Delhi.	United Provinces.	Central Provinces and Berar.	Bombay.	Bengal.
1		2	3	4	5	6	7	8
Who are—								
EARNERS (PRINCIPAL OCCUPATION).	Both sexes	299	311	318	411	321	345	378
	Males	299	304	314	393	308	339	344
	Females	19	15	20	17	13	27	34
Working Dependants.	Both sexes	69	68	47	69	66	69	62
	Males	36	34	14	41	32	36	31
	Females	33	34	34	28	34	33	31
Total Workers.	Both sexes	368	379	365	480	387	414	440
	Males	335	338	328	434	340	375	375
	Females	33	41	37	46	47	39	65
Non-working dependants.	Both sexes	632	621	635	520	613	586	560
	Males	330	328	317	193	283	229	220
	Females	302	293	318	327	330	357	340

It will be noticed that except in the case of Bengal and N W F P the proportionat number of workers is smallest in this Province If we turn to earners alone we find that their proportion in the North West Frontier Province is larger than in the Province but is very much smaller in Bengal while Kashmir State with a large proportion of workers has a smaller proportion of earners We have already referred to the case of female workers and it may be remarked here that the number of these is insignificant in this Province as compared to certain other provinces such as the United Provinces and Burma or Kashmir

State The only provinces where there is a still smaller proportion of female workers are the N -W F P and Bengal Though the difference in these proportions might partly be due to different interpretations of instructions, yet it cannot be denied that they indicate in some measure the main characteristics of the people of the provinces, a subject to which we shall revert after examining the conditions in the different parts of our own Province

Distribution of Non-working Dependants.

150 In order to ascertain the comparative industry of the various localities, we may examine the proportion of non-working dependants in the total population of each district or state of the Province The map below shows the non-working dependants *per mille* of the total population in each district and state The Himalayan tracts appear to have the smallest number of non-working dependants, *i e* below 400 *per mille* of total population, and consequently a larger proportion of workers [see also Subsidiary Table II (*a*)]

Non working dependants per 1,000 of the total population

The proportion of non-working dependants is again comparatively small in the eastern districts, such as Hissar, Gurgaon and Rohtak, while Lahore, Amritsar, Hoshiarpur, Ambala, Ludhiana, Faridkot and Maler Kotla as well as Jhelum and Dera Ghazi Khan have less than 650 non-working dependants *per mille* of the total population The proportion in Karnal and Ferozepore and Jullundur is higher than 650 In Karnal this may partly be due to the bad climate of the district, and in Ferozepore and Jullundur to a comparatively larger population under 15 years of age and to migration of able-bodied persons to the colonies The proportion in the central Punjab districts, mentioned above, would be still lower but for the large amount of emigration from them The proportion of non-working dependants is higher than 650 *per mille* in the rest of the districts to the west of the Ravi These districts are predominantly Muslim, and their female population, particularly the women of well-to-do families, are secluded and do no out-door work After this it should

not be difficult to connect the causes of the small number of workers in this Province and N W F Province and Bengal the provinces with a Muslim majority

SECTION 2—DETAILED EXAMINATION OF OCCUPATIONS

Detailed Examination of Occupational Distribution.

151 We can now take up some of the most important occupations individually In a survey such as this it is only possible to touch the most important items, and what follows is intended as an explanation of the census statistics rather than any comprehensive attempt to discuss the changes or to ascertain their causes much less to suggest remedies

Cultivation.

152 In the premier industry of the Province namely cultivation, are employed 5 340 486 males and 1,040,228 females of these 4,537 644 males and 229 8 8 females are recorded as earners, and 802,842 males and 810,350 females as working dependants, while 466 995 males and 19 486 females follow this industry as subsidiary to some other occupation.

The groups included in the category are 1—8 namely —

(A) CULTIVATION.

1. Non-cultivating proprietors taking rent in money or kind.
2. Estate agents and managers of owners.
3. Estate agents and managers of Government.
4. Rent collectors, clerks, etc
5. Cultivating owners.
6. Tenant cultivators.
7. Agricultural labourers.
8. Cultivators of Jhum, taungya and shifting areas.

No one in this Province has been returned in group No. 8 while the entries of groups 2 3 and 4 are relatively very small.

The following extract from Subsidiary Table IV at the end of this Chapter gives the actual figures of workers engaged in each of these groups, and compares them with the figures of 1021 Groups 2 and 4 and 5 and 6 have been amalgamated in order to facilitate comparison. Cultivation has shown a very big increase.

Group No.	PRINCIPAL OCCUPATION	Total actual 1931.	Number of workers in 1921.	Percentage variation 1921—31.
1	2	3	4	5
	A.—CULTIVATION	6,380,714	8,074,854	+20·7
1	Non-cultivating proprietors taking rent in money or kind	320 472	337 779	—5·1
2, 4	Estate agents and managers of owners, rent collectors, clerks, etc.	3,846	7,34.	—51·7
5, 6	Cultivating owners and tenants cultivators	5,176,395	4,243,877	+74·7
7	Agricultural Labourers	734,051	443,956	+65·3

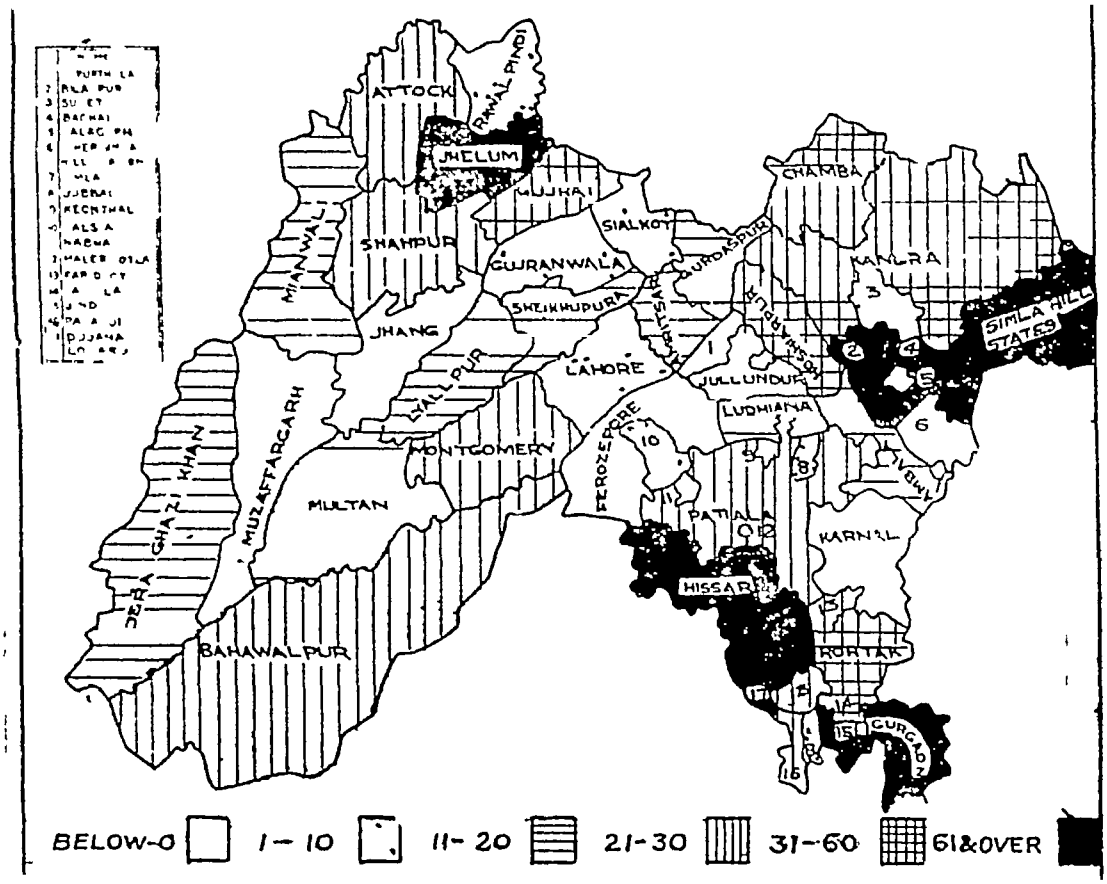

Rent-receivers.

It will be seen that there is a decrease of 5 1 per cent among non-cultivating proprietors who receive rent in money or kind In the first instance one might be disposed to urge that rent receivers are not workers and their figures should be excluded from cultivators altogether and included in class D meant for those who live on their income But rent receiving is directly associated with agriculture and a landlord as well as a tenant can be a rent-receiver if he leases out his land to another man. As a matter of fact a great majority of rent-receivers are also cultivators of some portion of their land though they prefer to return the more dignified occupation of rent receiving as their principal or only occupation.

There are almost half as many more persons returning rent-receiving as their subsidiary occupation (143 616) and no doubt there should be some more in this group who are now included in group 185 as "Jagirdrs," many of whom are in reality either rent-receivers or actual cultivators

Cultivating Owners and Tenants

153 There has been a very big increase in the already numerous category of cultivators The subject is of vital importance to the Province, and the map below shows the percentage increase in the number of cultivators including tenants since 1921 in each district and state

Increase per cent among cultivating owners and tenant cultivators (1921—31)

The increase is biggest in Simla and adjacent hill states and the districts of Gurgaon, Hissar and Jhelum It is fairly big in Rohtak, Kangra, Hoshiarpur and Gujrat In all these districts the demobilization of men serving in the Army may partly account for the increase, while in Gujrat the expansion of cultivation is the main cause The increase is between 20 and 30 per cent in Patiala, Montgomery, Bahawalpur, Shahpur and Attock, due to the first cause, especially in Patiala, Shahpur and Attock and to the large increase in cultivation in Montgomery and Bahawalpur The increase in Dera Ghazi Khan, Mianwali, Sheikhupura, Amritsar, Gurdaspur, Ludhiana and Ambala is between 11 and 20 per cent or about the same as the general rise in population during the last decade An increase of 10 per cent or less is only found in Rawalpindi, Sialkot, Gujranwala, Jhang, Lahore, Faridkot, Nabha and Mandi, while Jullundur, Karnal, Ferozepore, Muzaffargarh, Kapurthala and Sirmoor show a decrease. The conclusion to be drawn is that in these last-named areas the limit has been reached, beyond which the land is unable to yield a return to the labour of cultivators The main reason for the total increase, no doubt, is that in this

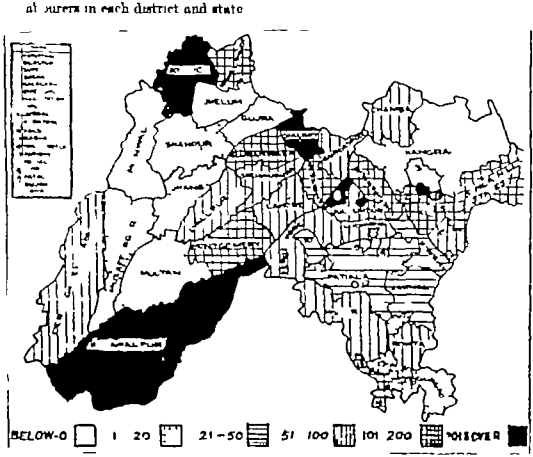

country agriculture is the mainstay of the people. The other resources of the Province are obviously not keeping pace with the rate of increase in the popu lation. Agriculture when pressed beyond a certain limit is said by economists to give diminishing returns for the capital and labour expended on it The increasing pressure on land unaccompanied by any great advance in the methods of agriculture or introduction of improved implements resulting in increased output must re-act on the economic condition of cultivators.

Agricultural labourers.

154 The increase among agricultural labourers is the next noticeable figure The number of these in British Territory is 591 960 males and 63 485 females inclusive of subsidiary workers, and 339 018 males and 38 944 females exclusive of these. The number for the whole Province exclusive of subsidiary workers is given in the table in paragraph 139 which shows an intercensal increase of 38 7 per cent The variation in the number of agricultural labourers ha to be examined along with the number returned as unspecified labourers, because the figures of the two are apt to get mixed up These figures for the two censuses are given in the margin, and indicate an enormous increase in the number of agricultural labourers.

Occupation.	1931.	1921.	Variation, increase (+) or decrease (−).
Agricultural labourers	736,028	653,806	+82·7
Labourers unspecified	18,727	22,572	−4

The map below shows the percentage increase among agricultural labourers in each district and state

Percentage increase among agricultural labourers (workers with principal occupation and working dependents of 1931 as compared to actual workers of 1921)

There i an increase of over 200 per cent in Bahawalpur State Attock Sialkot Kapurthala and Suket. Th actual number of fi ld labourers in other area xcept Sialkot was never very large so the percent ge increase i not a

true criterion of increase Moreover, in the case of such occupations it is difficult to vouch for the accuracy of each individual item for each district It is possible that there may be wrong classification of particular class of cultivators as agricultural labourers In numerous cases a rent-paying tenant is put down as an agricultural labourer and *vice versa*, more often the former Also tenants of Crown lands in the canal colonies are likely to have been returned as mere cultivators and as such would be included among field-labourers The increase in Montgomery, Gujranwala, Rawalpindi, Amritsar Hoshiarpur and Simla Hill States has been over cent per cent , and a large part of it must be real particularly in Montgomery where cultivated area has largely increased during the last decade Rohtak Hissar, Ferozepore Lahore Sheikhupura, Lyallpur and Dera Ghazi Khan show an increase of between 50 and 100 per cent , and when the results for two or more of the neighbouring districts are similar they furnish a strong testimony of the veracity of the figures In Patiala, Karnal and Ambala (all contiguous) there has been an increase of between 20 and 50 per cent There is an increase of less than 20 per cent in the districts of Shahpur, Jhang, Multan, Muzaffargarh and Gurgaon while there is an actual decrease in Mianwali, Jhelum, Gujrat and Mandi This may be due to emigration or only to the local differences in the interpretation of the terms

On the whole it will be safe to say that agricultural labourers have very greatly increased since last census

155 At this census cultivating owners have for the first time been tabulated separately from tenants The number of cultivating owners inclusive of subsidiary earners is 1,870,116 males and 102,831 females in British Territory and the number of tenants is 1,706,964 males and 449,850 females The number of cultivating owners will of course not be equal to the total number of owners of land entered as such in the records of rights as all the co-sharers in a *khewat* (joint holding) do not cultivate the land while many owners are joint in some and separate in other holdings The table in the margin shows the number of holdings in each district of British Territory together with the number of co-sharers as well as the total number of cultivating owners according to our tables It would seem that some of the sons of the owners, though separately cultivating part of the ancestral land have been returned as tenants, etc.

Cultivating Owners and Co sharers in Holdings.

Statement showing the number of Jamabandi holdings owners for the year 1930 31 and Total cultivating owners given in Table No X (Occupation)

Serial No	District	Number of Jamabandi holdings for the year 1930-31	Number of Co-sharers for the year 1930 31	Total cultivating owners given in Table X (Occupation)
1	2	3	4	5
1	Hissar	90,094	139 703	73,657
2	Rohtak	137 714	165,707	93,716
3	Gurgaon	165,687	144,817	77 940
4	Karnal	127,248	171,536	74,816

15	Sialkot	185,444	173,327	83,206
16	Gujranwala	71,144	81,592	17,902
17	Sheikhupura	55,167	85,041	43 742
18	Gujrat	103 971	102,311	110 440
19	Shahpur	85,370	108,640	49,804
20	Jhelum	150,581	150,051	72,851
21	Rawalpindi	212,165	189 025	51,229
22	Attock	117,425	105,313	51,059
23	Mianwali	87,703	135,986	40,661
24	Montgomery	46,766	72,893	24,283
25	Lyallpur	72,020	105,751	90,345
26	Jhang	62,122	123,589	36,062
27	Multan	83,603	123,571	36,030
28	Muzaffargarh	130,795	200,749	48,515
29	Dera Ghazi Khan	103,388	248,563	36,547
	British Territory	3,759,183	4,567,123	1,972,947

The average size of an agricultural holding in each district is very difficult to determine.* But even when correctly determined, the mere size is of little value if the number of persons supported by each holding is not available. Thus in districts like Multan, Shahpur and Attock where holdings are fairly large the average size of a holding will give an untrue picture of the conditions under which a cultivator works. The table in the margin shows the number of acres of cultivated land falling to the share of each worker engaged in cultivation whether as owner tenant or agricultural labourer The figures of workers only of Order I (a) have been taken as they are all workers in ordinary agriculture. The district with the smallest holding appears first The districts seem to be more or less in the same order as in the table in paragraph 53 (page 74) arranged according to the incidence of rural population on matured area. It will be realised that the average area per agricultural worker nowhere exceeds 13.2 acres, the average for the Province working out to no more than 6.4 acres

District.	Cultivated acres per worker engaged in cultivation (Sub-Class I Sub-Order I).	District.	Cultivated acres per worker engaged in cultivation (Sub-Class I Sub-Order I).
1		1	2
British Territory	6·7	Karnal	6·7
Simla	1·0	Muzaffargarh	6·7
Kangra	1·7	Lahore	7·1
Hoshiarpur	2·9	Dera Ghazi Khan	7·4
Jullundur	3·7	Lyallpur	7·8
Gurgaon	4·5	Gujranwala	8·1
Amritsar	4·8	Sheikhupura	8·1
Rohtak	4·7	Hissar	8·3
Gurdaspur	4·8	Attock	8·9
Simla	5·0	Montgomery	9·1
Ambala	5·1	Jhang	9·9
Rawalpindi	5·1	Ferozepore	9·9
Ludhiana	5·3	Multan	10·2
Gogra	5·8	Shahpur	11·0
Jhelum	6·1	Mianwali	13·2

The figures of persons who have cultivation as a subsidiary means of livelihood have not been included in the above calculations. In 1921 there were 149,230 persons, recorded as partially agriculturists At this census there are 486 481 persons who being earners with a principal occupation have cultivation as their subsidiary means of livelihood These half a million people and their dependants share the agricultural resources of the Province and the increase in their number is remarkably great

The other groups under cultivation namely estate agents and managers (owners and Government rent-collectors, clerks, etc., contain too few entries to require special notice The decrease among them is due to the more or less complete absence of Settlement operations the Settlement officials being usually the chief contributors to these groups.

Cultivation of Special Crops, etc.

150 The Sub-Order (b) of Order I namely cultivation of special crops" is only notable for the small part it plays in the economic conditions of the Province There are 8 033 workers (7 100 males 933 females) of all kinds returned as engaged in it.

Forestry

In Sub-order (c) of Order I the number of Forest officers, rangers, guard etc (group 17) and wood-cutters, charcoal burners and collectors of forest produce (group 18) has increased by cent per cent and 61 1 per cent respectively In Kangra the figures for Forest officers guard etc. are larger than those of wood-cutters, a the latter migrate to other places during the winter and were absent at the time of the cen us

Particulars.	Males.	Females.
1	2	3
Earners	14,471	1,197
Working Dependants	981	813
Earners 1th Subsidiary Occupation	1,415	22

Stock Raising

15" In Sub-Order (d) of Order I the total number of workers with stock raising a their principal occupation ha increased from 210 116 in 1921 to 256,564 in 1931 In addition to thes th re are 16,016 earners who are engaged

* See Calvert's Wealth and Welfare of th Punjab, page 74, here some of the difficulties are described.

in this work as subsidiary to some other occupation The districts with the greatest number are Karnal, Shahpur, Lyallpur and Multan In the groups under this sub-order there is an intercensal decrease among cattle-breeders, but the number of breeders of animals for transport, herdsmen, shepherds and breeders of other animals has increased

Birds and Bees

158 In Sub-order (*e*) of Order I, the number of keepers of birds and bees is almost negligible though it shows an increase over the figures of the last census

	Males	Females
Total workers 1931	76	6

Order 2 Fishing

159 In the main group of Order 2, there are only 4,653 workers whose principal occupation is fishing as compared to 4,011 at last census, which means an increase of 16 per cent There are 990 more earners who have fishing as an occupation subsidiary to some other Fishing appears to be a *spare-time job of Jhiwars and boatsmen*, who do not often care to return it

Sub-class II Order 8 Exploitation of Minerals

160 The number of persons engaged in the exploitation of minerals is very small The only considerable figure belongs to the Rawalpindi Division where the coal and salt mines, cement rock and petroleum fields are situated There is a decrease in this sub-class since 1921 owing no doubt to the recent depression Mining of metals like iron, lead, silver, zinc and manganese is entirely unknown, while the handful of persons returned as mining gold are either "*Nayariyas*" or persons presumably employed on gold fields in Mysore, who happened to be home on leave at the time of the census As regards the non-metallic minerals, there are salt workers of the salt range, situated in the Jhelum and Shahpur Districts, and workers in the washing of saltpetre, etc , chiefly in the Ambala Division There are also some coal mines in Jhelum District, but the figures seem to be obscured by the return of a vague term "*kan men kam karna*" (working in mine)

	Males	Females
Earners	4,936	616
Working Dependants	260	73
Earners with Subsidiary Occupation	193	1

	Males	Females
Group 40, Non metallic minerals, Salt, etc	2 448	609

	Males	Females
Group 41, Other mines	276	

Class B

161 So far we have been dealing with Class A or with "the supply of raw material by exploitation of the surface of the earth, animals or vegetation" We shall now proceed with the next class B, that is with "the preparation and supply of material substances" or in other words Industry, Transport and Trade We shall take each of the sub-classes individually

Sub-Class III Industry

Number per mille of the total population occupied as earners with principal occupation and working dependants engaged in Industry 1931

162 The map in the margin shows the population *per mille* of each district and state engaged in Industry The proportion is highest in Lahore, Amritsar, Ambala, Gujrat, Jhelum and Gujranwala Remote areas

like Jhangra, Dera Ghazi Khan, Bahawalpur Chamba the Simla Hill States and other states in the neighbourhood being the most backward in this respect The chief industries are confined to the supply of the primitive needs of agriculture or household.

The figures of workers in Industries show a decrease of one per cent., which may be due partly to an increase in group No. 188 a portion of whose figures, if properly recorded would undoubtedly have been included in some of the orders under Industry The table in the margin gives the main figures of the various kinds of industries, the figures of group 188 being also shown

Occupations.	Principal occupation (Different kinds of Industry)	Total number of actual workers. 1921.	1921.	Increase+ or decrease−
1	2	3	4	5
Sub-Class III	*Industry*	1,791,589	1,781,767	−1
Order 6	Textiles	460,628	460,228	+1
Order 6	Hides and Skins	16,992	22,656	−25·0
Order 7	Wood	168,991	173,986	+2·5·1
Order 8	Metals	83,847	77,296	+2·1·4
Order 9	Ceramics	108,710	84,730	+14·6
Order 10	Chemical Products	47,905	51,881	−7·7
Order 11	Food Industries	87,206	90,936	−1·9
Order 12	Industries of dress and the toilet	434,820	441,702	+2·1
Order 13	Furniture Industries	1,099	1,531	−29·1
Order 17	Miscellaneous	313,981	342,813	−9·2
Group 188	Manufacturers, businessmen, contractors otherwise unspecified.	11,..88	6,962	+71·6

Textiles. The number of persons recorded as workers in textile industry is about the same as in 1921 while the total population of the Province has risen by 12·5 per cent This may be due to the introduction of labour-saving devices and does not necessarily mean any decrease in output The only industry to show a real increase in personnel is "Metals under which the main occupation are blacksmithy implement making and the making of metal utensils for domestic use. The increase therefore is merely due to the expansion of local requirements as the industry carried on by the *lohar* (blacksmith) and *thathiar* (utensil-maker) is primarily to meet local needs.

	Males.	Females.
Earners	304,029	43,616
Working Dependents	14,733	22,311
Earners with Subsidiary Occupation	24,851	4,363

Metals.

	Males.	Females.
Group 80, Blacksmiths		
Total workers 1921	91,314	1,729

	Males.	Females.
Groups 80 and 81, Utensil makers		
Total workers 1921	7,2..1	27

Ceramics. Another industry showing expansion almost commensurate with the increase in total population is ceramics, which has pottery as its chief item. The need supplied by the potter is evidently increasing at the same rate as the population.

	Males.	Females.
Group 82, Pottery		
Total workers 1921	108,441	8,261

Wood. Wood is another industry which shows an increase corresponding to the rise in the population. The main group in this order is that of carpenters and turners and the carpenter like the blacksmith and the potter is just as much in demand as before

	Males.	Females.
Group 83, Carpentry etc		
Earners	112,877	1,974
Working Dependents	7,997	864
Earners with Subsidiary Occupation	11,853	49

Food Industries and of Dress and Toilet. These industries seem to be more or less stationary It may be added that those engaged in food industries are in most cases also the sellers and thus the figures are liable to a slight interchange There is a small increase for instance among sellers of sweetmeats and part of it is possibly due to this interchange

Hides and Skins. These industries show a large decrease and very probably numerous persons engaged in tanning mainly Chamars have returned some agricultural occupation.

Chemical Products. The Chemical industry does not seem to be flourishing having declined by about 8 per cent

There is a decrease of 9 3 per cent in miscellaneous industry mainly accountable by a larger decrease from 280,781 to 213 616 or 13 2 per cent in the chief item of this order, namely scavenging The decrease in the figures for scavenging may be due to an increasing dislike for the work itself or for its return as an occupation When a Chuhra becomes a *Mazhabi* (Sikh) or a *Wassalli* (Muslim) he as a rule gives up the work of scavenging There are 8,350 males and 2 098 females with scavenging as a subsidiary occupation Other industries in this order namely makers of jewellery printers engravers, etc show a slight increase Miscellaneous.

163 The number of persons employed in transport of all kinds shows an increase of 2 1 2 per cent The transport by air is at present quite negligible in amount Transport by water which enjoyed a considerable patronage in the past is decreasing owing to the improvement in transport by road and rail and most of the persons included in the present figures are the employees of the irrigation department some of whom are possibly included in groups 189 and 191 The figures of other main heads under transport are given in the margin for this as well as the 1921 Census Sub-Class IV Transport

		1931	1921	Variation
Sub-Class IV	Transport	[illegible]	[illegible]	+9·7
Order 20	Transport [illegible]	[illegible]	[illegible]	10·3
21	Transport by Rail	8,13,8	6,6,5	+23·0
22	Post Telegraph and Telephone services	11,2[illegible]	8,0[illegible]	+39·7

This branch of transport has made great progress during the last decade Its importance so far as public utility is concerned is very much greater than the number of persons actually engaged in it The indirect advantages resulting from the development in transport far outweigh the disadvantages of some unemployment caused among muleteers, tonga and bullock cart drivers, etc Transport by Road

Transport by rail shows an increase of 25 per cent over the figures of 1921 That both the figures of 1921 and 1931 are incomplete and some persons employed in Railway workshops or railway construction might have been included in other groups particularly group 191 is shown by the figures of railway employees given in Subsidiary Table VI at the end of this Chapter and reproduced in the margin It may be pointed out that the North Western Railway which has supplied these figures extends over this Province as well as the North-West Frontier Province British Baluchistan Sind and parts of the United Provinces and the figures are possibly not fully adjusted Transport by Rail.

	Railway Department	
1	*Total number of persons employed*	*107 0[illegible]*
2	Officers	332
3	Subordinates on scales of pay rising to Rs 250 p.m. or over	1,338
4	Subordinates on scales of pay rising from Rs 70 to Rs 249 p.m	38 070
5	Subordinates on scales of pay under Rs 70 p.m	66 927

The number of workers in these services inclusive of those having one or the other of the services as a subsidiary occupation show an increase of 39 7 per cent The figures as supplied by the department inclusive of Delhi give a total of 14,000 employees as against 13,000, the aggregate in the census tables * The difference is very slight and may be due to some employees, especially branch post-masters, who are very often school-teachers and shop-keepers of villages not having returned Postal service as their means of livelihood The Postal Administration like the Railway is not co-terminous with this Province, the N W F Province, Delhi and even Kashmir State being included in the Punjab Postmaster-General's circle Post, Telegraph and Telephone Services

* Inclusive of Delhi Order 12 has got 12,850 persons

Sub-Class V Trade.

164 The last sub-class of Class B is trade and the number of persons employed therein shows an increase, which is really larger than is indicated by the figures owing to an inaccuracy in the 1921 figures Some of the figures are reproduced in the margin for facility of reference Orders 23 and 24 which deal mainly with commerce show a decrease as compared with the figures of 1921 which can be explained only by a decrease among money lenders. It is rather striking that the number of persons engaged in commerce should be relatively so small.

Sub-Class or Order	Occupation.	Actual Workers. 1931.	Actual Workers. 1921.	Variation per cent.
1	2	3	4	5
Sub-Class V	Trade	617,113	443,455	+39
Order 23	Banking and Exchange	43,479	44,803	−2·9
Order 24	Brokerage and Commission Agents	10,299	10,479	−2·0
Order 25	Trade in Textiles	53,478	40,823	+30·9
Order 26	Trade in Skins	11,522	5,601	+105·7
Order 27	Trade in Wood	11,251	7,212	+67·2
Order 28	Trade in Metals	4,160	1,733	+139·9
Order 29	Trade in Pottery Bricks and Tiles	3,021	339	+790·9
Order 30	Trade in Chemical Products	8,318	8,906	−34·7
Order 31	Trade in Hotels, Cafes, Restaurants	1,858	4,864	+214·0
Order 32	Trade in sales and food stuff	167 798	317 943	−47·2
Order 33	Trade in Toilet articles and Clothing	9 413	8,221	+14·6
Order 34	Trade in Furniture	2,899	4,069	−37·9
Order 35	Trade in Building materials	961	813	+98·3
Order 36	Trade in means of Transport	13,861	21,857	−36·7
Order 37	Trade in Fuel	7 780	1,817	+329·3
Order 38	Trade in articles of luxury	5,923	5,713	+11·6
Order 39	Trade in other Sorts	225,721	63,231	+170·2

Commerce.

Money-lenders

According to the present returns, there are in group 115 (which includes bank managers money lenders money-changers, etc) in the British Territory 30 903 males and 1 191 females returned as such in the column of principal occupation In addition to this there are 4 661 males and 88 females returned as working dependants These must be persons who follow this occupation in order to assist the head of the family in his daily business Thus the total number of persons engaged in money lending, etc as principal occupation is 36,803 persons (35,564 males and 1,279 females) There are moreover 11,613 males and 86 females with whom money lending is a subsidiary occupation and apparently the majority of these are agriculturist money lenders The number of workers in the corresponding group in 1921 was 38 132 persons (35 043 males and 3 089 females) and there is thus a decrease among money lenders pure and simple The census return however may not be quite complete as the occupation of money lending has become unpopular in many places and may therefore not have been returned as such

In the Provincial Banking Inquiry Report (1930) at page 190 we find the following remarks —

"The chief problem of banking in the Punjab is the problem of the money lender In 1922 Mr Calvert calculated the number of money lenders at about 40 000 The estimate appears to have been based upon various statistical returns mainly relating to income-tax and none later than 1918 10 Latterly account can have been taken of either the agriculturist or the female money lender because the latter has probably never appeared in the income-tax returns and the former has only begun to do so since 1921 when income-tax administration became more efficient We shall see presently that agriculturist money lenders excluding those who advance only against mortgage number about 19 000 It is impossible to calculate the number of women who lend but the evidence of the Inspectress Co-operative Societies, shows that it must be considerable for about 5 per cent of the 2 000 members of women's co-operative societies apparently make a practice of it The Census Report for

1921, on the other hand, states that the number of ordinary money-lenders has almost certainly declined If we set off the number of women who lend against this decline, we are still left with 59,000 money-lenders Tentatively, therefore, but cautiously, we may say that in the Punjab there must be at least 55,000 who depend solely or in part upon money-lending We are upon surer ground when we add that after agriculture money-lending is the most important industry in the Province, and that in 1928-29 it paid 36 per cent of the total income-tax by business and industry "

On page 133 of the same Report the reasons given for the decline in money-lending business are summed up as follows —

" All agree that the *sahukar* is reducing his business For this many reasons are assigned, the most important of which are the following.—

(*a*) The legal protection given to the peasant proprietor borrower, combined with a greater tendency on his part to take full advantage of it ,

(*b*) the rise of the agriculturist money-lender ,

(*c*) the rapid growth of co-operative credit societies, and

(*d*) the counter-attractions of trade "

Order 25 Trade in Textile.

Trade in textiles has shown a fairly big increase This order includes the " *Bazaz* " (cloth merchant), who has plied a profitable trade during the prosperous years of the last decade

Order 26 Trade in Skins, Leathers and Furs

This industry appears to have declined, but the trade in skins which is the chief item in this order shows an increase of 19 4 per cent

Wood, etc.

There is an increase in the trade in wood, pottery, bricks and tiles, but the trade in chemical products like the industry shows a decline The comparatively small trade in metals seems to be growing

Order 31 Hotels, etc.

Hotels, cafes and restaurants show a big increase indicative of a new social development Formerly taking refreshments and meals at hotels and restaurants was almost unknown, but with the increased facilities of travelling the habit is spreading and promises to play a prominent part in the social life Thus in a place like Lahore the house-wife could in many cases be considerably relieved of her ordinary duties and will find more leisure for handicrafts such as embroidery, knitting and spinning

Order 32 Trade in Food Stuffs.

There is a decrease in this order due almost entirely to the transfer of " *dukan nun-tel* " (a popular term for the village general merchant) from group 134 to group 150 The village general merchant deals in all kinds of commodities for daily use, from sugar candy to medicinal herbs, from paraffin oil to rat poisons, and what not

Order 33 Trade in Clothing and Toilet Articles

This order deals with the " *bisati* " *par excellence*, and shows an increase nearly proportionate to the general rise in the total population

Smaller Trades

The figures of Orders 34, 35 and 36 are too small to need any comment except that trade in building material seems to be on the increase The decrease in Order 35 is due probably to the great decline in the number of sellers of *ekkas*, tongas and other carts, and also to the centralization of the motor trade in large towns

Fuel etc.

Trade in fuel has grown though its figures are even now rather small This trade is generally combined with some other trade such as selling of *bhusa* (straw) The trade in articles of luxury has declined, there being a big decrease

in sellers of bangles, neoklaces etc There is an increase in Order 20 Trade of other sorts, due to the reasons referred to above namely the inclusion in it of village shopmen.

Class C. Administration. Public Force.

165 The next class of occupation C is Public Administration and Liberal Arts The main figures are given in the margin There is a large decrease in the Imperial Army and a slight decrease in the Air Force while the figures for the Indian States Army show a small increase In the British Territory there were 41 009 persons, both principal workers and with subsidiary occupation, in the Police or 2 *per mille* of the total population. Village watchmen show a big increase partly due to the increase in the number of villages, and work out at one *per mille* of the total rural population

Class, Sub-Class or Group.	Total number of actual workers		Increase or decrease per cent.
	1931	1921	
1	2	3	4
Class C.	413,451	374,178	+10·5
VI.—Public Force	103,850	117,115	−11·7
183 Imperial Army	40,246	74,811	−45·0
184 State Army	9,853	9,518	+3·7
185 Navy	1	1	100·0
186 Air Force	197	208	−5·1
187 Police	49,306	31,885	+54·4
188 Watchmen (village)	4,043	2,199	+141·9
VII.—Public Administration	64,718	44,171	+79·2
189 Service of the State	39,961	39,042	+69·0
190 Service of Indian and Foreign States	14,333	11,211	+29·6
191 Service of Local Bodies	10,424	6,128	+171·4
192 Village Service	14,910	8,243	+80·8

Service of the State.

166 There is a big increase under Public Administration. In British Territory the number of servants of the State works out at 2 *per mille* of the total population while their proportion in the Punjab States is 3 *per mille*. There is also a very big increase in the number of servants employed in local bodies. It is possible however that some of the servants of local bodies have been included in State service or *vice versa*. The classification of Public Service is difficult a vague terms such as *sadar sarkar* creep in and are difficult of allocation to different departments. It is perhaps needless to add that every endeavour has been made to include in this category all State servants except the employees of the Irrigation and Postal Departments as well as the P W D officials engaged on road and buildings professors teachers and doctors, who go under other heads. The figures are also obscured by some of the State servant hooning to return rent receiving *Jagir* bank interest etc as their principal and subsidiary occupation

Professions and Liberal Arts.

167 The sub-class VIII shows an increase of 6·7 per cent over the figures of 1931 The main figures for the two censuses are given in the margin There is a marked increase in Law Medicine and Instruction though Religion shows a decrease If the groups in each order are examined we find the biggest increase among lawyers and teachers In Order 49 Letters Art and Sciences, there is an increase of 28·8 per cent among journalist etc (group) but the total number is still no more than 3,208. The most numerous category of musicians, etc., (group 178) how a decline in no way unexpected while astrologers acrobats etc, (group 181) have increased

Sub-Class VIII.	*Professions and Liberal Arts*	1931.	1921	Variation per cent.
Order 45	Religion	102,33.	110,711	−11·5
46	Law	18,227	8,431	+8·1
47	Medicine	9,843	17,808	+6·8
4	Instruction	27,823	21,45.	+30·2
49	Letters, Arts and Sciences	3,.20	33,333	−8·8

Class D. Miscellaneous.

168 The last Class D contain "miscellaneous occupation Th important items of this la are domestic service in sufficiently described and "non productive" occupations. The cla on the whole h shown a small

decrease The main figures are given in the margin There is an increase in the comparatively small number of persons (sub-class IX) living on their income In addition, 28,228 persons have this occupation as a subsidiary means of livelihood There is a decrease under 'domestic service' as already alluded to There is a small but unfortunate increase in sub-class XI (insufficiently described occupations), though only confined to group 188 This group should rightly belong to Industry, group 189* to Commerce and the major portion of group 191† to Cultivation Fortunately the last two groups show a decrease since last census

Class, Sub-class or Group. 1	Principal Occupation. 2	1931 3	1921 4	Variation per cent 5
Class D		760,904	807,231	−4·6
Sub-Class IX	Persons living on their income	33,415	23,898	+39 8
Sub Class X	Domestic Service	268,534	278,905	−3 7
Sub-Class XI	Insufficiently described occupations	242,089	239,388	+1 1
Group 188	(a) Manufacturers, business men and contractors otherwise unspecified	11,256	6,563	+71 5
Group 189	(b) Cashiers, accountants, book keepers, clerks and their employees	9,691	11,108	−12 8
Group 191	(c) Labourers and workmen otherwise unspecified	219,737	220,572	−4
Sub Class XII	Unproductive	225,866	285,040	−14 8

169 The unproductive occupations (sub-class XII) show a decline especially among the number of beggars and vagrants, the latter now number 208,616 though some part of the decrease may possibly be accounted for by an increase in group 165, in which are included religious mendicants, and in group 166, which includes servants of religious edifices But even if the whole increase in those two groups were due to the inclusion of beggars, which is improbable, beggars it is satisfactory to note have decreased by 29,570 or by 11 8 per cent Beggars and vagrants still form 7 *per mille* of the total population, but in this connection it has to be borne in mind that unlike the rest of the population in their case almost every male, female or child is a 'worker' **Beggars and Vagrants**

SECTION 3.—OCCUPATIONS OF SELECTED CASTES.

170 We can now take up the subject of the occupations followed by members of the most numerous or important castes The absolute figures according to occupations for these are given in Imperial Table XI in which the occupations have been grouped under 13 main heads The extent to which the members of each caste are workers or non-working dependants is of some interest, as also the question as to what proportion of all workers is engaged in the traditional occupation now as compared with the past The table below furnishes the necessary statistics **Occupations of Selected Castes.**

Caste by Religion and traditional occupations		Number per 1,000 workers engaged in traditional occupation		Number of workers per 1,000 of the total strength

Sheikh	(Muslim)	298	348	352	335

*The full heading is "Cashiers, accountants book keepers, clerks and other employees in unspecified offices and warehouses and shops."

†The full heading is "Labourers and workmen otherwise unspecified."

To take up the traditional occupations first it can be said that with the exception of Muslim Tarkhans (carpenters) and Sheikhs and Hindu Aroras the proportion of workers of each and every caste following traditional occupation has fallen. The castes most conspicuous in discarding the traditional occupations are Chamar both Hindu and Sikh (proportionately more Hindus than Sikhs) Chhimba (both Muslim and Hindu) Hindu Julaha, Hindu Tarkhan and Lohar

Turning to the proportion of workers in the total population we find that Hindu Jat Ahir and Rajput have a high proportion of workers, no doubt due to their industriousness as well as to the large number of women workers among them. Muslim Rajputs are comparatively indolent and their women as a rule do not work, mainly because of the *purdah* system. Meos seem to be fairly hardworking now and the effect of uplift work would appear to be more lasting than some people imagine. In Industrial occupations the proportion of Chuhra Chamar Tarkhan, Lohar and Kumhar workers is still very high and though they have considerably discarded their traditional occupations Chuhras and Chamars are not thereby becoming idle. In the case of Chamars the biggest increase is among field labourers and under the head Transport, but the figures for these Orders are not quite comparable with those of 1921 as on the present occasion only principal occupations of earners have been tabulated for all occupations other than traditional. Among the artisan classes the proportion of workers among Hindus is higher than among Muslims, see for instance *Kumhar Lohar* and *Tarkhan* So it is not the number of female workers alone which is responsible for this disparity but Hindus are probably more industrious and another drawback from which Muslims suffer is the comparatively larger number of children who are necessarily dependants.

Among the castes which have trade as their traditional occupation the total workers range between 305 and 312 *per mille* of the total population. Aggarwal, a caste of the eastern Punjab has a somewhat larger proportion than Arora or Khatri Sheikhs, with trade as their traditional occupation would at first sight appear to be more industrious than their Hindu brethren but only a few of them are really traders. Sheikh is an all-embracing term and comprises followers of all sorts of occupations, particularly industrial

Occupation of Brahmans.

171 Due to their pre-eminence among castes, Brahmans deserve special mention in respect of their occupations. In the marginal table are given the number of earners following each occupation as well as the proportion per 1 000 of the total earners in each case Brahman in this Province are mainly agriculturists more than 50 per cent of the earners being engaged in exploitation of animals and vegetation and 44 per cent in cultivation pure and simple The next highest

Brahman (*Hindu*).

OCCUPATION.	(1931 CENSUS.) EARNERS.	
	Actual figures.	Proportional figures.
1	2	3
All Occupations	330 797	1 000
1. Exploitation of animals and vegetation	167,909	509
2. Exploitation of minerals	278	1
3. Industries	9 071	27
4. Transport	10,529	32
5. Trade	39,315	119
6. Public force	2,043	6
7. Public administration	8,156	25
8. Arts and professions	50 078	152
9. Persons living on their income	2 114	6
10. Domestic service	15,519	47
11. Contractors, clerks, makers etc	1 ,3	4
12. Labourers unspecified	4, 70	13
13. Beggars, prostitutes, criminals and inmates of jails and asylums	7,316	22

percentage (18·2) of Brahman which is higher than that for all other castes except Sayad is engaged in Arts and profession mainly in callings connected with religion which in their case is the traditional occupation. Earners engaged in trade amount to 11·9 per cent of the total while 4 per cent are domestic servant and 2 per cent are employed in Industries and 2·5 in Public Administration

172 It will not be without interest to examine the extent to which women of different castes are found to be workers or non-working dependants The table in the margin shows the number of female workers per 1,000 male workers among 42 of the most numerous or other selected castes

Female Workers in each Caste

Number of female workers per 1,000 male workers

Caste	Number of female workers per 1,000 male workers	Caste	Number of female workers per 1,000 male workers	Caste	Number of female workers per 1,000 male workers.
1	2	1	2	1	2

Dhobi	129	Mirasi	124	Tarkhan	93
Faqir	104	Mochi	84	Teli	104

The hill-women of the Rathi Kanet and Dagi and Koli castes seem to be real amazons and as many as 740 to 799 *per mille* of males are recorded as workers Among the plain-dwellers the *Meo* women of Gurgaon have a share in the men's work in large numbers (652 *per mille*) The Ahir women of the south-east are also very hard-working, as also the Brahman women Brahmans abound in the south-east of the Province, where they are not priests but agriculturists The *Chuhra* women too are a hardworking class, as also the *Jhiwar* and the *Chamar* The Sansi women also appear to be comparatively more numerous as out-door workers I have used the term 'out-door work' because in the majority of these cases women assist in cultivation or other work, and if they did only domestic work however hard or profitable they would not be treated as workers according to the census classification Among the castes with the smallest number of female workers Arora, Biloch Aggarwal and Khatri are conspicuous Only a small proportion of the Pathan, Sayad and Sheikh women has been returned as workers, chiefly owing to the *purdah* system prevailing among them The proportion of female workers *per mille* of male workers in 1921 for Arain and Kamboh is 52 and 45 respectively and the present results are not much different The Arain and Kamboh women may thus be regarded as taking very little share in the work of their husbands in the fields

SECTION 4.—EDUCATED UNEMPLOYMENT.

Educated Unemployment

173 On the next page appears Table XII of this census the only Imperial Table to be printed in this part of the Volume The figures contained in it are abstracted from special schedules, filled up by those whose minimum educational qualification was Matriculation standard, and who were unemployed or dissatisfied with their jobs and wishful for employment These schedules were distributed by the enumerators in the course of the preliminary enumeration and collected when they went round their blocks on the final census night The filling-up of the schedules was voluntary, and the response was extremely meagre The figures in the table consequently do not at all represent the extent of the educated unemployment It is difficult to draw definite conclusions from the figures, but it may be safely remarked that the greatest unemployment exists among the matriculates, aged between 20 and 24 years The next highest figures are among the Arts graduates of the same age The number among other classes is very small These remarks relate to Part II of the Table The only indication of the figures in Part I is that among the unemployed the proportion of those unemployed for longer than a year and those who are the sons of cultivators is the highest

TABLE XII

EDUCATED UNEMPLOYMENT

1 This is a new Table and is divided into two parts. Part I shows the educated unemployed by class and Part II by degree.

2. There being no separate column in Part II for persons, who have passed the Intermediate Examination, their figures have been included in those of Matrics and are shown separately in the following statement —

INTERMEDIATE PASSED	Total.	Aged 20—24.	Aged 25—29.	Aged 30—34.	Aged 35—39.

CHAPTER IX

LITERACY

171 General. 172. Local distribution of literacy. 176. Literacy in cities and selected towns. 177 Literacy by main religions. 178. Progress of literacy in the younger generation. 179. Returns of Education Department. 180 Adult literacy 181 Literacy by selected castes. 182. Literacy in English 183. English literacy by castes. 184 Literacy in vernaculars. 185. Comparison with other provinces.

Reference to Statistics. The statistics figures for literacy by age sex and religion are given in Imperial Table XIII; Part A contains the provincial summary and Part B the details for each district and state, while Part C shows the details for cities and selected towns. Imperial Table XIV gives the details of literacy by castes selected castes, tribes and races.

The Provincial Tables in Part III of this volume are XIII A., giving the statistics of literates in the four vernaculars, Urdu, Hindi, Gurmukhi and Roman by religion for the whole Province, its main political divisions and each district and state and XIV A giving literacy figures of the three castes of Vedic Dharm, Brahmo and Dev Dharm.

Of the nine Subsidiary Tables which show derivative figures of literacy and are briefly described below eight appear at the end of this Chapter.

Subsidiary Table I gives the literacy *per mille* by age-groups, sex and religion for the whole Province as well as the number of total literates in English *per mille* of the populations, aged 5 years and over This is reproduced in the text

Subsidiary Table II gives the number of literates *per mille* by age sex and locality for each district, state and Natural Division.

Subsidiary Table III gives by religion, sex and locality for each district, state and Natural Division the total literacy *per mille* of the population, aged 5 years and over the number of literates in certain vernaculars and the number of the primary-passed per 1,000 literates.

Subsidiary Table IV gives by sex and locality for each district, state and Natural Division the number of literates in English per 10,000 of the population in the four age-periods, 5—10, 10—15, 15—20 and 20 and over for the 1911 Census as well as the number of total literates (for each sex separately) in English per 10,000 of the population aged 5 years and over for the four decades, 1901 to 1921.

Subsidiary Table V gives for the two censuses of 1921 and 1911 the number of literates *per mille* as well as the number of literates in English per 10,000 of each selected caste.

Subsidiary Table VI gives the number of literates of both sexes *per mille* of the total population in each of the six censuses since 1881 and for the three age-groups, 10—15, 15—20 and 20 and over for the last two censuses for each district, state and Natural Division, separately

Subsidiary Table VII gives by sex, the absolute figures of population, literacy and literacy in English for four age-periods, 5—10, 10—15, 15—20 and 20 and over for the whole Province.

Subsidiary Table VIII shows the growth in the number of educational institutions, scholars and expenditure on education from 1859 60 to 1930-31, based on departmental returns.

Subsidiary Table IX gives the total number of schools and scholars by tahsil and district as well as the average number of scholars per school in each case according to the information supplied by the Director of Public Instruction, Punjab. These figures relate to the year 1930 31

General. 174 The instruction to enumerators with regard to the return of literacy were as follows —

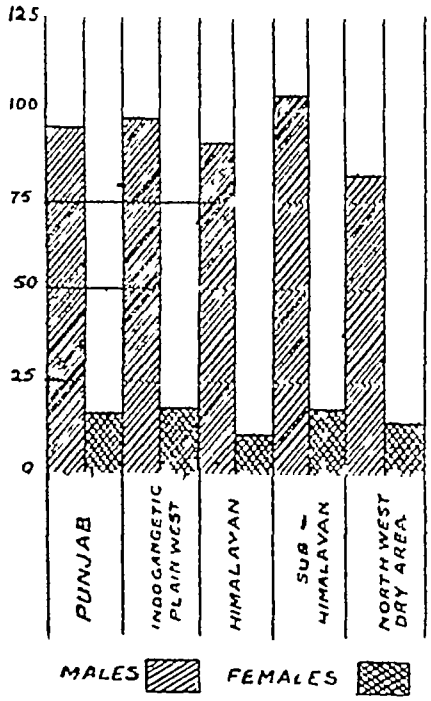

(*Col. 16 (literate or illiterate)*.—If literate in Urdu write Urdu if literate in Hindi write Hindi if literate in Gurmukhi write Gurmukhi if a person can read *and* write in Roman *characters write Roman. Otherwise* enter against all persons who can both read and write a letter in any other language the word literate If not make a cross (×)

The test of literacy which was the same as at the last three censuses, was thus simple enough, *i.e.* the ability to read and write a letter The actual figures of literates in the Province and its two main political divisions are given in the margin together with the proportion of literates 5 years and over *per mille* of each sex. Even according to the simple test of ability to read and write a letter the number of literates in the whole of British Territory is 1 097 041 males and 1,50 713 females, or 100 and 17 *per mille* of the total population aged 5 years and over of each sex, respectively as compared with 77 and 10 *per mille* at last census The intercensal increase in literates amounts to 45 4 and 92·9 per cent among males and females respectively as against 12·9 and 14 1 per cent increase in the actual population of each sex In spite of the large increase in the number of literates the amount of illiteracy is still very great the actual number of illiterates aged 5 and over in British Territory (15 698 40) being greater than in 1921 (14 148 817)

Territorial Division.	Literate aged 5 years and over 1931		Proportion per mille of each sex	
	Males.	Females.	Males.	Females.
Punjab	1,...54,715	162,297	85	13
British Territory	1,097,01	150,713	100	17
Punjab States	141,4[illegible]	12,167	70	7

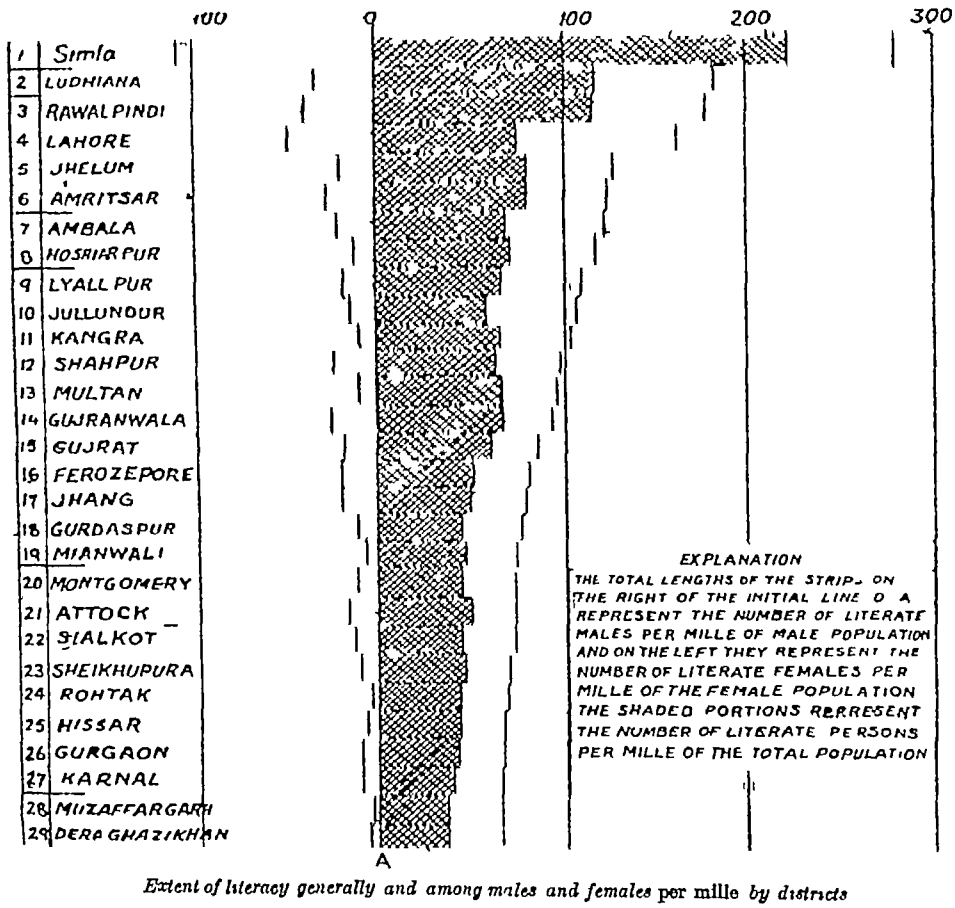

Local Distribution of Literacy

175 The distribution of literates may first be examined by Natural Divisions The diagram in the margin shows by means of rectangles the number of literates *per mille* of each sex in each Natural Division The Sub-Himalayan Division shows the highest amount of literacy, both male and female The Indo-Gangetic Plain comes next, followed by the Himalayan, the North-West Dry Area being the most backward This distribution is indicative of the fact that a high proportion of literacy obtains in areas, whose development took place several decades before the canal colonies in the North-West Dry Area came into existence

Number of persons per 1,000 who are literates in each Natural Division

The diagram below shows the distribution of literacy *per mille* of the total population of all British districts The literacy of males *per mille* of the male population is shown by the entire length of the rectangles on the right side of line O A, its shaded portion representing literacy *per mille* for both sexes The smaller rectangles on the left represent female literacy

Extent of literacy generally and among males and females per mille *by districts*

The districts have been arranged in the order of male literacy, and we find that Simla with a large number of persons engaged in Public Administration

has the largest proportion of literacy both male and female. Of the districts in the plains, Ludhiana, Rawalpindi Lahore, Jhelum, Amritsar Ambala, Hoshiarpur Jullundur Kangra, Shahpur and Multan appear at the top in point of male literacy With the exception of Lahore, which is the capital of the Province and the biggest educational and a large business centre, the high percentage of literacy in these districts seems to be considerably affected by the large number of ex-soldiers residing in those districts or owing to the existence of cantonments. The high incidence of literacy in Ludhiana is mainly due to its being a small compact district, with a large Sikh population, which finds it comparatively easy to become literate in their peculiar script, Gurmukhi. The same applies to the Sikh population of Rawalpindi The returns of some districts might slightly be affected by bogus returns, a fact to which reference will be made later in this Chapter The most backward districts in point of literacy would seem to be Dera Ghazi Khan, Muzaffargarh Karnal, Gurgaon, Hissar and Rohtak.

Variation per cent. among literates of all ages (1921—1931).

The map in the margin shows the increase per cent. for the last decade in literates of all ages and of both sexes in each district and state of the Province. There has been a big increase in literacy in the central districts Ludhiana, Amritsar and Lahore the colony districts, Sheikhupura, Lyallpur Montgomery Multan and Shahpur and Bahawalpur State. In these areas the increase in total population has also been about the biggest The increase in the three first named districts is solely due to an advancement in literacy on the part of the population, a factor probably only secondary in the case of colony districts, where the main cause is immigration. A big natural increase, which means a replacement of the old population by children, might easily result in retrogression so far as proportional literacy is concerned, but immigration which for the most part adds adults to the population often causes the opposite result. Men in the various branches of public service lessees land-agents, shopkeepers etc. whose number goes up with the colonization of a tract mean so many literates added to the population of a locality

Of the districts named above Ludhiana and Shahpur and most of the districts with the next highest percentage of increase namely Rawalpindi Jhelum, Gujrat and Mianwali also owe the increase in literacy to the return home of demobilized soldiers who very often pick up reading and writing in Roman or in one of the vernaculars in the course of their military career The large percentage increase among literates in Mianwali is due to the recent prosperity consequent upon a large rise in cultivated area during the last decade

The percentage increase in Gujranwala Nabha and Chamba too is high and though in Gujranwala like Amritsar and Lahore this represents an

advancement in literacy the increase in the case of the two states is more apparent than real For instance the number of literates in Chamba has only risen from 3,238 in 1921 to 4,610 in 1931 and even now only 36 persons *per mille* are literate

The increase in literacy in Attock Gurdaspur, Hoshiarpur, Jullundur, Ambala, Maler Kotla Ferozepore, Hissar and Karnal is very considerable, and all these districts with the exception of Attock belong to the eastern half of the Province The increase in Jhang Sialkot Mandi and Patiala is quite small, and in Sialkot, as remarked in Section 7 of Chapter I, rural population has decreased during the last decade The smallest increase in literacy is to be found in Rohtak, Gurgaon, Kangra Muzaffargarh, Sirmoor and the Simla Hill States The only district which has registered a decrease in literacy is Dera Ghazi Khan

Literacy in Cities and Selected Towns

176 The table below gives the absolute as well as the proportionate figures of literates *per mille* of the population in each of the cities and selected towns of the Province, the figures for literacy in English being also shown So far as the absolute figures are concerned, Lahore City—the educational centre of the Province—is at the top both in respect of general literacy and literacy in English Nearly one-fourth of its inhabitants can read and write, but only 43,000 inhabitants are literate in English, about one-eighth of whom are females From the standpoint of the proportion of literates in the total population Lyallpur eclipses Lahore both in respect of literacy of all kinds and literacy in English Even the town of Sargodha seems to be better off than Lahore in respect of the proportion of literates *per mille* of the total population These facts need not occasion a surprise, as the causes responsible are not difficult to locate For example, a contributory cause may be the different interpretations of instructions or the overzeal of a citizen to return himself as literate Moreover, according to the census definition a University graduate as well as a *Mahajan* knowing only *Lande* or *Hindi Mahajani* (business script) is returned as literate, and Lyallpur and Sargodha are the chief colony towns, crowded with businessmen, and have also a large proportion of persons employed in occupations connected with Public Administration and the Liberal Arts and Professions as compared with Lahore, which has a large proportion of old residents

Town	Total Literates			Literates in English			Number of Literates *per mille* of the Population 5 years and over					
							Total Literacy			*English Literacy*		
	Persons.	Males	Females.	Persons	Males	Females	Persons	Males	Females	Persons	Males	Females
Lahore	100,885	81,631	19,254	42 916	37,478	5,478	269	333	140	114	153	42
Amritsar	39,037	32,043	7,294	12,288	10,485	1,803	174	231	82	53	74	20
Multan	15,301	13,596	1,705	5,035	4,640	395	147	225	39	48	77	9
Rawalpindi	27,523	24,769	2,754	12,397	11,158	1,239	264	364	76	119	164	34
Sialkot	12,054	10,987	1,067	4,844	4,145	699	140	210	32	56	79	21
Jullundur	14,028	11,607	2,421	4,262	3,823	439	183	259	76	56	85	14
Ambala	16,180	13,479	2,701	6,367	5,954	413	214	293	91	84	129	14
Ludhiana	11,898	8,891	3,007	4,772	4,173	599	200	251	124	80	118	25
Ferozepore	12,210	10,126	2,084	4,550	4,164	386	216	292	96	81	120	18
Lyallpur	14,546	11,190	3,356	4,621	4,022	599	389	463	264	124	163	47
Sargodha	7,517	5,494	2,023	2,324	2,159	165	327	378	240	101	140	20

The amount of literacy in other towns requires no special notice except that the figures for towns with cantonments are comparatively higher For example, the number of literates in Rawalpindi and Ambala seems to be particularly affected by this cause

Literacy by Main Religions.

177 The absolute figures of literacy are given by religions and main age-periods in Table XIII. Subsidiary Table I below shows the proportional distribution of literates *per mille* by age for each religion and sex for the whole

SUBSIDIARY TABLE I.

Literacy by age, sex and religion.

Religion	Number *per mille** who are Literate.										Number *per mille* aged 5 and over, who are Literate in English.		
	All ages 5 and over			5—10		10—15		15—20		20 and over.

Sikh	87	158	16	28	3	111	16	164	24	181	12	12	23	2
Jain	362	494	218	114	44	258	123	434	217	506	254	43	82	4
Buddhist	63	121	13	11	1	116	15	168	15	187	16	1	2	
Zoroastrian	529	555	445	45	36	500	417	452	373	631	511	463	446	321
Muslim	21	33	8	12	4	43	8	80	12	61	7	7	12	1
Christian	162	153	171	34	36	80	84	136	164	164	184	46	49	44
(European)	695	690	433	333	215	434	480	778	448	708	412	486	483	283
(Indian)	59	71	50	28	30	80	34	97	93	83	48	37	38	25
Jew	230	400	104	1 000						200		133		133

Proportion is calculated on the population of the age-period concerned and not on the total population.

Province. Europeans and Anglo-Indians naturally have the largest proportion, while Zoroastrians (Parsis) are a good second. In general literacy Hindus and Sikhs are nearly equal but very much behind Jains who as a rule belong to the trading classes, mainly Aggarwal. The literacy among Muslims is about the lowest being even lower than that among Indian Christians, whose females are particularly well advanced. The amount of literacy is not only small among Muslims of all ages but the number of literates *per mille* of (school-going) ages 5—10 and 10—15 is even now less than half that of Hindus. In the higher ages the proportion drops to about one-third Ad Dharmis can lay no claim to literacy to any considerable extent, and their proportion is nearly half that for Muslims. Buddhists dwell mainly in the remoter parts of Kangra District and the Simla Hill States, and most of them are illiterate

One of the important causes for the comparatively small number of literates among Muslims is that unlike Hindus and Sikhs they do not, to any appreciable extent acquire literacy without going to school. The only sphere of life which gives them an opportunity to become literate in adult age is military service In the case of Hindus and Sikhs their occupations very often help them in learning to read and write This is borne out by the high proportion of literates among Jains The proportion of literates among the trading class of Hindus such as Arora and Khatri is similarly very high. Among Sikhs a large number of artisans pick up reading and writing in their every-day business, and numerous Sikh women are literate in Gurmukhi which is not at all difficult to learn. The proportion of literacy is higher among Sikh females than among the Hindu, and it is even more pronounced among the young generation (female children aged 5—10) As compared with Muslims the proportion of literates among Hindus and Sikhs becomes higher at ages over 15 This may be due to several causes, such as the great r possibility of relapse into

illiteracy among Muslims or the greater advance made by them only in recent years A corroborative fact is that the proportion of the primary-passed is smaller among Hindu and Sikh literates than among the Muslim

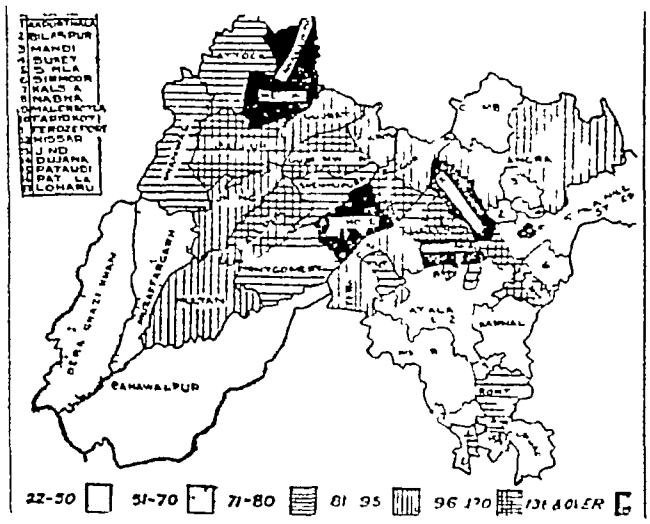

Proportion of primary passed per 1,000 literates

Locality	Hindu & Sikh				Muslim		Christian	
	Males	Females	Males	Females	Males	Females	Males	Females
Punjab	512	239	406	118	755	650	702	120
I —Indo-Gangetic Plain	524	203	364	127	740	678	353	490
II —Himalayan	385	77	430	150	741	448	244	171
III —Sub Himalayan	589	241	478	108	762	604	203	313
IV —North West Dry Area	487	189	430	113	771	500	495	624

In the marginal table are given the proportions of the primary-passed* *per mille* of all literates belonging to the main religions in each Natural Division It shows that more Muslim literates of both sexes are primary-passed than literates of all other religions Very few of the literate Sikh females are primary-passed indicating that they pick up Gurmukhi at home

178 The advance made in literacy during the last decade, no doubt mainly due to the activities of the Education Department, is confined mainly to persons aged over 10 and under 20 It is believed to be mainly responsible for the proportion of literates in ages 10—20 The map in the margin shows the proportion of literate males of these ages *per mille* of all males of those ages enumerated in each district or state This proportion would seem to be highest in Lahore, Hoshiarpur, Simla, Ludhiana Jhelum and Rawalpindi (136 and over *per mille*), the next highest proportion (over 95 *per mille*) obtaining in Shahpur, Lyallpur, Gujranwala, Amritsar, Jullundur and Ambala The districts with a proportion lower than 95 *per mille* are Multan, Jhang Gujrat Sialkot, Gurdaspur Ferozepore and Kangra, followed by Rohtak, Montgomery Sheikhupura, Mianwali and Attock and the States of Nabha, Pataudi, Faridkot and Kapurthala The proportion of literates is very small in the Districts of Hissar Gurgaon Karnal, Muzaffargarh and Dera Ghazi Khan and the States of Patiala and Mandi the Simla Hill States and Sirmoor while the remaining states show a still smaller proportion It is unsafe to generalize about the amount of literacy imparted in schools, but it appears that in most of the districts the educational institutions (schools *pathshalas* and *maktabs*) at present in existence have not turned out male literates from amongst the members of the younger generation (aged 10—20) in excess of 95 *per mille* which is the average proportion of male literacy in the Province for all ages In these districts literacy is hardly making any headway, and the hope of spreading education in the backward tracts in order to raise the provincial proportion of literacy seems to be far from realization When this younger

Progress of Literacy in the Younger generation

Male literates aged 10—20 per mille of the Boys of the same age (1931)

*Primary passed was made a question in the Census for the first time in 1921 and therefore the figures after that year The figures at the previous Census were reduced from five to four classes [illegible]

generation grows up the position of the Province will, I am afraid, not be substantially better than it is now The census figures of literacy could not be materially wrong and if an error at all exists it would be due rather to the overzeal on the part of a community to swell the figures of its literates. In the face of these facts the view expressed in the Annual Report on the Progress of Education (1930-31 p 12) quoted below might occasion some surprise.

> Time was when we heard much of the backwardness of the Multan Division and in particular the Ilis of Muzaffargarh but our Inspector of the Multan Division writes:—
>
> The percentage of boys in school to the male school-going population ranges from 61 to 81 as shown in the following table:—
>
> | | | |
> |---|---|---|
> | Montgomery | .. | 81 per cent. |
> | Jhang | | 61 |
> | Lyallpur | | 77 |
> | Multan | | 78 " |
> | Dera Ghazi Khan | | 69 " |
> | Muzaffargarh | | 61 |
>
> "These figures again approach what we used to hope to achieve only through compulsion. The second class in this Dr. boast is 61 per cent. of the first, and the fourth class is 78 per cent. of the enrolment in the third.

Reform of Education Department.

179 It will be of interest if we could here summarize the position of the Province from the standpoint of educational progress as gathered from the statistics published by the Education Department in their annual reports. The figures given in the margin show the number of scholars (both sexes) in the different stages in all the schools in British Territory for each year of the last decade According to the view expressed by the Indian Statutory Commission* a sustained course of instructions for a minimum period of four years is essential to establish a literacy that lasts. About two-thirds of the scholars in the fourth stage may thus be regarded as becoming literate every year If the figures at one stage are compared with the figures for the next higher stage in the following year the amount of stagnation will be evident.

Number of pupils (males and females) in schools by stages

Year.	Class I.	Class II.	Class III	Class IV	Literates below 20 surviving at the time of census (taking 1 of Class IV and allowing 15 per mille as death-rate annually).
1	2	3	4	5	6
1911-22	233,817	91,243	69,580	50,406	29,119
1922-23	313,605	89,698	73,402	47,221	33,959
1923-24	317,120	109,398	76,471	41,229	34,373
1924-25	325,849	111,206	86,430	47,447	40,915
1925-26	409,644	160,219	93,190	73,230	45,461
1926-27	449,961	178,109	90,122	62,911	51,029
1927-28	457,648	203,314	103,812	61,.11	53,436
1928-29	425,110	218,690	117,981	90,298	58,272
1929-30	443,737	221,807	129 639	97,854	61,255
1930-31	471,422	242,303	131 681	109,619	71,979
Total literates below 20 estimated from departmental returns (1922-31)					457,696
Literates below 20 according to the 1921 Census (British Territory)					395,812
Difference					62,784

The figures of literates turned out during the last nine years very approximately give the total literates below 20 at this census after an allowance is made for the deaths during the last decade In the last column of the table above an estimate of the survivors has been made on the assumption of an annual death rate of 15 *per mille* The number actually returned as literates below 20 at this census has also been given The difference between the estimated outturn and the actual figure might be regarded as due to relapse into illiteracy of boys, who passed their fourth class in the early years of the decade and to some of them being now above 20 which is not at all improbable The primary standard was reduced from 5 to 4 classes in 1919 and the amount of relapse during the last decade would naturally be greater than before

* Report of the Indian Statutory Commission, Vol. I, P. 264.

Number of girls in schools by stages

Year.	Class I.	Class II	Class III	Class IV
1	2	3	4	5
1922 23	36,488	10,142	7,260	5,055
1923 24	35,594	10,075	7,543	5,293
1924-25	36,623	10,387	7,933	5,395
1925-26	42,079	11,208	8,336	5,752
1926-27	47,295	12,374	8,700	6,130
1927 28	58,683	14,200	9,776	6,627
1928-29	59,777	16,072	11,763	8,191
1929-30	60,550	18,941	12,732	8,977
1930 31	77,823	21,480	14,815	10,546

The table in the margin shows the figures of girls at school during the last nine years of the decade It appears that in the case of girls the extent of decline in numbers at each higher stage is even greater than that among boys

Adult Literacy

180 The view has been held in Educational circles that an important means of fighting illiteracy among the masses in this country is by the education of adults The Co-operative Department has also been paying considerable attention to adult education Numerous night schools were opened during the last decade, most of them being conducted by the local bodies with the assistance of Government grants and some by the Co-operative Department The statement in the margin shows the annual number of scholars in these institutions and the number of literacy certificates granted by the Education Department to adult scholars at some of these schools It is very probable that the presence of these schools has given a great stimulus to adults acquiring literacy on their own account, as the figures which we shall soon examine admit of no other satisfactory explanation According to this statement the number of adults, who have acquired literacy during the last decade (about 30,000), though in a way gratifying, is negligible We shall now endeavour with the aid of census statistics to form an idea of the attainment of literacy by adults

Literacy certificates granted in the Punjab British Territory

1927 28	90,834	*4,856*	2,663	1,256	332	605	
1928 29	Not available	*4,113*	2,413	1,075	278	200	147
1929-30	48,997	*4,402*	2,083	1,013	515	681	110
1930-31	45,788	*5,211*	2,391	1,705	462	476	177
Total	*491,941*	*28,197*	*17,436*	*6,262*	*1,797*	*2,089*	*613*

The total number of literates aged 20 and over in 1931 should obviously be less than that of literates aged 10 and over in 1921 Their number is less in Punjab States but considerably in excess in British Territory The actual figures are given in the margin, and it will be useful to compare these with similar figures of an educationally advanced province like Madras, where the forces operating in this Province were probably absent It is apparent that in Madras Presidency the existing literacy among males and females aged 20 and over is considerably less than the 1921 literacy in the population aged 10 and over

Locality	Literates aged 20 and over in 1931	Literates aged 10 and over in 1921	Increase (+), Decrease (—)
1	2	3	4
Punjab	894,464	871,278	+23,186
British Territory	768,475	745,118	+23,357
Punjab States	125,989	126,160	—171
Madras	3,086,013	3 531,448	—445,435

The main cause for the excess in the figures of literates in British Territory is acquisition of literacy by adults Another reason is that many pupils in the primary classes aged 10 or above in 1921 attained literacy subsequently This result may also be due partly to a fictitious return of

literacy in some vernacular on account of the communal tension and the Urdu-Hindi-Gurmukhi controversy Perhaps the fact that on the present occasion specific instructions were issued about the recording of literacy in commercial scripts (*Lande Sarrafe* and *Hindi Mahajani*) as well as in Roman may also be a contributory cause

Before examining by religions the figures of adult literacy we may discuss them by locality We shall for the present ignore the literacy among females as it will be admitted that among them the age of attainment of literacy even at school is higher than among males, and many a female now over 20 has in fact acquired it at school during the last decade as a result of general awakening among females. The table in the margin shows the figures for districts, in which male literates aged 20 and over exceed the total male literates aged 10 and over in 1921 without any allowance having been made for deaths during the decade. In Mianwali and Gujranwala the excess is negligible. The increase in Montgomery is mainly due to the large influx of immigrants from the various parts of the Province many of whom were literates. The large increase in Lahore is mainly due to an enormous adult immigration to the capital of the Province during the last decade. A similarly satisfactory explanation is not available for the increase in the figures for Lyallpur Multan Ludhiana Amritsar Shikhupura Gujrat and Shahpur but in these districts the increase may partly be due to the fact that many boys in the primary classes in 1921 attained literacy after the age of ten. The increase in Amritsar Multan Lyallpur and Ludhiana is particularly marked and may in these places more than elsewhere be due in part to the Urdu Hindi Gurmukhi controversy

Male Literacy figures for some districts.

District.	Literates 20 years and over in 1931.	Literates 10 years and over in 1921.	Excess.

The second column of the table shows the figures of male literates aged 20 and over in 1931 In column 3 are shown the figures of literates who would be still surviving out of the 1921 literates aged 10 and over the death-rate of 150 *per mille* during the last decade having been applied to obtain their number It will be conceded that the assumed death-rate is not at all excessive and should at the same time leave enough margin for slight movements of population that might have occurred Column 4 gives the excess of the figures in column 2 over those in column 3, while columns 5, 6 and 7 show similar results for females It is evident that figures of all religions show an excess of varying magnitude being due mainly to adults having acquired literacy

We have dealt so far with the districts, in which the excess in literacy figures among persons aged 20 and over was transparent The figures for other districts may also contain a small increase in adult literacy, but not large enough to wipe out the effect of deaths among literates during the last decade and thus to show an actual excess in the present figures Details for each district need not be gone into, but a reference to the total figures for British Territory is necessary The figures in the first six lines of the table above give the information for the total British Territory similar to that about the districts appearing in the table The figures for Christians and Jains which have also been added, do not show any acquisition of literacy by adults Jains become literate in early life while numerous Indian Christians have occupations which

afford no opportunity for acquiring literacy in adult age. On the whole we find from columns 4 and 7 in respect of literacy among adults, an increase of 135,125 in males and 22,476 in females of all religions, while the degree of increase varies in the case of the three main religions. Assuming the excess to be 100 among Sikhs the proportions of increase will be as given in the margin. It has, however to be remembered that many literate Hindus who adopt Sikhism at each census swell the figures of literacy among Sikhs. Hindus come next in this respect, while Muslims, especially their females, seem very apathetic

	Sikh.	Hindu.	Muslim
Persons	300	72	52
Males	100	24	29
Females	100	39	17

In paragraph 156 of the 1921 Report, Mr Jacob made a forecast of the number of literate males above the age of 20 at this census. He estimated an annual increase of 50 000 as a result of the attainment of fresh literacy by boys at school. To the probable survivors of these he added the probable survivors of the literates of 1921 and thus obtained the figure of 814 808 as the total number of male literates over 20 in British Territory at this census. His surmise about the number of literates, turned out by the schools during the last decade, has proved to be fairly correct, but what he seems to have over looked is that a great majority of these boys would be still below 20 in 1931 The literates now aged 20 and above comprise (1) the survivors of all literates aged 10 and over of 1921 (2) the persons who became literate in adult age during the decade, and (3) a certain number of boys who attained literacy at school during the first year or two of the last decade The number of literates of the last two categories could not have been predicted with any amount of precision.

Literacy by Selected Castes.

181 The table below shows the literates *per mille* of the total popula tion of certain selected castes for the 1921 and the present census.

Statement showing the number per mille of the total strength of each sex who are literate among certain castes.

Caste.	1931.		1921.		Caste.	1931		1921	
	Males.	Females.	Males.	Females.		Males.	Females.	Males.	Females.
I.—Agricultural					3. Dhobi	28	4	19	3
1. Ahir	28	2	21	1	4. Julaha	28	2	20	1
2. Arain	41	7	28	3	5. Kumhar	17	2	9	1
3. Awan	54	8	36	1	6. Machhi	13	2	6	1
4. Baloch	19	1	16	1	7. Lohar	41	4	29	2
5. Gadbr	27	2	19	1	8. Mochi	17	1	9	1
6. Jat	45	6	31	3	9. Nai	32	2	17	
7. Kamboh	49	7	40	2	10. Sunar	58	14	146	15
8. Mera	17		13		11. Tarkhan	36	7	24	5
9. Pathan	114	10	84	13	12. Teli	19	2	13	1
10. Rajput	63	8	57	5					
11. Saini	16	7	61	4	V.—Criminal Tribes				
					1. Bawaria	16	3	3	
II.—Pastoral					2. Harni	1		1	
1. Bachhara	228	27	108	17	3. Pakhiwara	23	2	21	1
2. Gujral	175	26	141	23	4. Sansi	13	2	80	8
III.—Traders					VI.—Others				
1. Aggarwal	402	37	371	18	1. Chohra	10	2	4	
2. Arora	294	56	294	29	2. Jogi	47	3	37	2
3. Khatri	280	91	273	68	3. Jhiwar	22	2	21	2
4. Mehta	262	34	196	23	4. Machhi	14	1	7	1
IV.—Artisans					5. Mirasi	23	2	24	1
1. Chhimba	53	5	57	4	6. Musalli	5		2	
2. Chuhar	11	1	9		7. Dagi and Kali	6		9	

In each and every caste except Sansi whose 1921 figures seem to be excessive there is an increase in the number of literates, both male and female.

The table also shows how certain castes, such as Aggarwal, Khatri and Arora, have stood out at both the censuses with a prominently high percentage of literacy The figures of these castes would compare favourably even with those of Europeans, Anglo-Indians or Zoroastrians, if the comparison were confined to persons between the ages of 15 and 40 Brahmans, Sayads and Sheikhs seem to be literate in fairly large numbers, and to a lesser extent Pathans and Kashmiris The agricultural castes are, of course, very backward, but Rajputs, who receive large accretions from the well-to-do and educated members of lower castes, and Sainis are proportionately better educated, while of the others Kambohs, Jats, Awans and Arains are almost on the same level The Ahirs, Gujjars and Meos are in the background, though the two last-named have made much progress during the last decade As regards the artisan castes, such as Lohar and Tarkhan, there is not much to choose between them and their agriculturist neighbours Jat and Arain, while the Sunar (goldsmith) is comparatively much better off Of the village menials, *Kumhar*, *Mochi*, *Teli*, *Machhi* and *Dhobi* are still backward, and the criminal tribes under State supervision have drawn level with them, the Pakhiwara actually claiming a higher proportion of literacy The depressed classes, namely, Dagi and Koli, Chamar and Chuhra, and their Muslim counterparts, Mochi and Mussalli, are the most backward of all

Literacy in English

182 In British Territory there are now 230,390 males and 19,217 females who are literate in English as compared with 128,242 males and 11,293 females in 1921 Excluding the Europeans and Anglo-Indians the literates in English comprise 222,006 males and 17,117 females, or 22 and 2 *per mille* of the population of each sex over 5 years old respectively

The progress of English literacy is shown below by an extract from Subsidiary Table IV, the figures of general literacy being also shown side by side

Natural Division	*Total number of literates per mille* *								*Literates in English per 10,000 of each sex aged over 5*							
	1931		1921		1911		1901		1931		1921		1911		1901	
	Males.	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
Punjab	*95*	*15*	*74*	*9*	*62*	*6*	*64*	*3*	*188*	*19*	*118*	*12*	*92*	*12*	*71*	*7*
I.—Indo Gangetic Plain West	98	17	74	9	62	6	59	3	206	24	128	25	104	13	75	7
II —Himalayan	91	8	83	9	61	5	67	4	109	9	85	26	58	24	48	16
III.—Sub Himalayan	104	17	85	11	65	7	68	4	241	21	155	16	115	13	90	9
IV —North West Dry Area	82	13	62	7	60	4	69	3	126	9	70	4	54	4	46	3

* The proportion of literates for 1931 and 1921 has been worked out on the basis of the population of each sex aged over 5, and for 1911 and 1901 on the basis of the total population

English literacy like that in vernaculars is making progress everywhere with this difference that in its case the Himalayan Division is more backward than the North-West Dry Area

English Literacy by Castes

183 The literacy in English is most widespread among the castes noted in the marginal table, which compares the number of literates in English per 10,000 of the total strength of each caste with that of 1921 The castes are arranged alphabetically The Khatris, both male and female, have the largest proportion of literates in English The Sheikhs, Sayads, Aggarwals, Brahmans and Aroras come next in the order The Kashmiris take the seventh place, having doubled their proportion since last census, and are followed by Pathans

Statement showing the number per 10,000 of the total strength of each caste.

Caste	Literate in English			
	1931		1921	
	Males	Females	Males	Females
Aggarwal	383	13	258	7
Arora	350	23	255	10
Brahman	379	17	312	7
Kashmiri	336	26	167	7
Khatri	1,048	67	976	37
Pathan	291	17	212	7
Sayad	392	20	297	4
Sheikh	448	34	385	12

Literacy in Vernaculars.

184 As already stated, literacy in four main vernaculars, namely Urdu, Hindi, Gurmukhi and Roman was recorded at this census. Roman is Urdu or Punjabi written in English characters. The figures of other scripts like *Hindi Mahajani* and *Lande* though recorded were not tabulated for reasons of economy Table XIII A, printed in Part III of this Volume gives the literacy in each of the important vernaculars by religion for each district and state. The Provincial Summary is reproduced below for facility of reference.

The number of persons literate in these vernaculars is smaller than the detail given under each vernacular as some persons are literate in more vernaculars than one and have been included in the figures for each. The detail of dual literacy appears on the first of the above mentioned Tables.

A large majority of the people are literate in Urdu their number being double that of literates in other vernaculars put together. The strength of Hindi and Gurmukhi is about equal while literates in Roman are comparatively few. Roman is being taught in the Army to illiterate soldiers and at next census the number of literates in this script is bound to increase. The number

of literates among Hindus despite their numerical inferiority is much greater than that among Muslims, the latter claiming a larger number of literates in Urdu Only very few Muslims and Christians are literate in Hindi and Gurmukhi, while the number of Hindus literate in Hindi is one-half of those literate in Urdu Gurmukhi is, of course, the vernacular of Sikhs, and actually more Sikhs are literate in Gurmukhi than in Urdu, more particularly so in the Punjab States

185 The table in the margin shows the number of literates *per mille* among those aged over 5 years in this Province and some other provinces and states of India The proportion of literacy is higher in this Province than in the contiguous provinces and states, such as the North-West Frontier Province, Rajputana Agency, Jammu and Kashmir State and the United Provinces The proportion of literates in the Presidencies is, however, very much greater, Madras having a proportion of literates almost twice as large as the Punjab The proportions for provinces with a large urban population like Delhi and Ajmer-Merwara are also higher

Comparison with other Provinces

Province	Literates aged 5 and over *per mille* of the population aged 5 and over

CHAPTER X.

LANGUAGE

186 General 187 Scheme of Classification of languages 188 The Linguistic families 189 Indo-European languages 190 Tibeto-Chinese languages 191 Linguistic division. 192 Punjabi. 193 Lahnda or Western Punjabi 194 Hindustani 195 Western Pahari 196 Rajasthani 197 Pashto 198 Balochi 199 English 200 Tibeto Chinese languages 201 Kashmiri 202 Sindhi 203 Nepali 204 Minor languages Odki 205 Persian 206 Bhili 207 Bengali 208 Gujarati 209 Marhatti. 210 Tamil and Telugu 211 Arabic 212 Central Pahari 213 Other minor languages 214 Bi lingualism 215 Literary activity in different languages

Reference to Statistics

Imperial Table XV gives the absolute figures, Part A containing the mother tongue of persons living in the Province and Part II showing the number of persons who habitually use some other language as subsidiary to their mother tongue

Subsidiary Table I gives the distribution of the population by mother tongue for the whole Province according to the censuses of 1931 and 1921, languages being arranged according to the main heads in Sir George Grierson's Scheme An additional column, showing for each language the number of speakers *per mille* of the population according to the 1931 Census is inserted in this table

Subsidiary Table II (a) gives the total number of speakers of each of the eight important languages, returned in the Province as mother tongues, and the number of persons using each of these languages purely as their mother tongue per 10 000 of the population for each natural division district and state

Subsidiary Table II (b) gives the number per 10 000 of the speakers of each mother tongue, who speaks some other language in addition to it for each natural division, district and state

Subsidiary Table III shows the number of books published annually in each language from 1922 to 1931

General.

186 The instructions to enumerators with respect to the return of language were as follows —

"*Column* 14 (*Language*) —Enter each person's mother-tongue In the case of infants and deaf-mutes the language of the mother should be entered

"*Column* 15 (*Subsidiary language*) —Enter the language or language habitually spoken by each person in addition to his mother-tongue in daily intercourse"

No column was provided for subsidiary languages at last census The instructions about the entry of mother-tongue are the same as those issued in 1921 except that they were supplemented by a direction that Urdu and Hindi should be recorded as Hindustani It is quite impossible to draw a definite line between Urdu and Hindi as spoken In fact the discrimination between the two had been given up in other provinces at previous censuses because it was held that the distinction could not be drawn, depending as it did on a choice of vocabulary rather than any clearly defined linguistic test

At this census the return of language was one of those things, in which many people, particularly in towns, took a keen interest Below are reproduced the contents of a handbill distributed far and wide on the eve of the preliminary enumeration

CENSUS OPERATIONS HAVE BEGUN

Question !	*You Should Answer*
Religion	Vedic Dharm
Sect	Arya Samajist
Caste	Nil
Race	Aryan
Language	Arya Bhasha (Hindi)

The Census Committee, Arya Samaj, Wachhowali, Lahore

No doubt this sort of propaganda had a certain amount of effect, particularly on the figures of urban areas The District Officers of several districts have mentioned in their reports on the census enumeration that numerous persons in some admittedly Punjabi-speaking urban areas, both Hindus and

Muslims, insisted upon returning Hindi or Urdu as their mother tongue Efforts were made by the enumerating agency to explain to them that under the instructions Urdu and Hindi would be recorded in the census schedule as Hindustani and therefore it was no use returning either as mother tongue in place of Punjabi In a town in the Gujranwala District I myself had to remonstrate with certain persons who were in possession of the above-quoted handbill and wanted to return Hindi in place of Punjabi as their mother tongue In Lyallpur Town a Muslim barrister interviewed me while the preliminary enumeration was in progress and enquired whether he could return Urdu as his mother tongue, because the language as spoken by him contained many Arabic and Persian words, and was therefore more akin to Urdu than Punjabi I pointed out that Punjabi did not cease to be Punjabi even if it became polished in the manner described. I wonder whether my advice found favour with him at the time of actual enumeration. There is no doubt in my mind that many persons returned Urdu or Hindi as their mother tongue in place of Punjabi, and thus the figures of Hindustani have been unduly swollen at the expense of Punjabi

The difficulties in the way of a correct return of languages have been referred to in all the previous census reports. The stumbling block is the uncertainty on the part of the speakers themselves, as to the name of the language or dialect spoken. I cannot do better than quote the remarks of Sir Edward Maclagan in his Report on the 1891 Census, which still hold good.

> The chief difficulty lies in the matter of names. The orders to enumerators were that the mother tongue of each person should be entered under the name applied to it by that person, and experience officers were fervently cautioned against substituting names of their own. But the present as little known that he is talking Punjabi or Hindi as M. Jourdain knew he was talking prose and it would be very difficult to get any definite answer from him without certain degree of prompting. The question is whether such prompting should be officially recommended, or whether the official recollection of the name under which the language of the district is to be returned is not sufficient of itself that which it is intended to save. That such official notifications are given out by local officers in spite of all instructions is obvious. In Karnal for instance Hindi and Urdu were under orders entered as Hindustani, in Rajanpur the common dialect of the people as under orders entered as Jatki and the large Gujar population of Harnai as Varnali, Hindi in Loharu and Punjabi and Hindi in Pahawalpur which will be noticed later show clearly enough that the enumerators are working under some general orders on the subject. Mr Younghusband, Deputy Commissioner Dera Ghazi Khan, writes strongly in favour of some system by which, here different words are applied to the same language sons should by authority be selected and the people asked In west another tongue each must mark language and if not, which is it? I think myself that in following such prescription we should be ill of be mockeries as we were before of the census, but am not myself prepared I recommend any wa out of the difficulty other than that of omitting the language returns altogether as being unreliable and unnecessary

In this connection the following remarks of Mr Rose in the 1901 Census Report will also be of much interest.

> It was, however clearly the best and safest course to record in the actual Census, the dialects as returned by the people themselves, leaving their final classification to linguistic expert. But there are great obstacles to complete record on this simple basis. In the first place men will seldom admit that his language is Jangli, or of he is at all educated, Punjabi, just as few people in Earlham Hall plead guilty to provincial accent. It is also the people little further on, little deeper in the hills,—whose speech is Jangli or pahari—of the desert or of the mountains. In the next place every official is more or less of linguistic expert himself and quite ready to inform you how such dialect should be classified, with the result that all distinct, as well as few disappears, and many minor but distinct dialects are not fully returned.

I am disposed to agree with Sir Edward Maclagan that the return of language should be omitted altogether and more attention paid instead to the entries of age literacy or occupation. The figures of the language table are so much affected by the difficulties of classification that the results are in some places very difficult to explain. We shall however endeavour to elucidate them as far as possible

Scheme of Classification of Languages.

187 The scheme of classification of languages is almost the same as that adopted at the last three censuses, being based on the "Linguistic Survey of India" by Sir George Grierson. The revised classification as far as applicable to this Province is reproduced in Subsidiary Table I at the end of this Chapter together with the figures of the present and the last census. The only important change that has now been made in this classification is the substitution of Hindustani for Urdu and Hindi.

The Linguistic Families

188 All the languages of the Punjab belong almost entirely to the Aryan branch of the Indo-European family There are 28,302,000 persons who return these languages as their mother tongue, or in other words these are spoken by 996 out of every 1,000 people of this Province If to this were added the speakers of European sub families the number of speakers of Indo-European languages would rise to 997 *per mille* of the population Of the remaining 3 *per mille* of the population, 2 *per mille* speak the languages of Tibeto Chinese family and the remainder all the other languages such as Odki (unclassed Gypsy family), Arabic (Semitic family), and Tamil and Telugu (Dravidian family)

Indo-European Languages

189 The chief languages of this family belong to the Aryan sub-family and fall almost entirely in the category of the Indo-Aryan branch These are the mother-tongues of 990 *per mille* of the population, while the languages coming under the Eastern group of the Eranian branch, *viz*, Bilochi and Pashto, are spoken by 2 and 3 *per mille*, respectively The Dardic branch, to which belongs Kashmiri, is the mother-tongue of the remaining 1 *per mille* Taking up the sub-branches of the Indo-Aryan branch we find that Lahnda belonging to the Western group of the outer sub-branch is spoken by 259 *per mille* of the people, while of the languages falling under the Central group of the inner sub-branch, Hindustani is spoken by 140, Rajasthani by 22 and Punjabi by 509 *per mille*, the Western Pahari of the Pahari groups of this (inner) sub-branch being spoken by 59 *per mille* The only language, spoken by about 5,000 persons and falling under unclassed gypsy languages of India, is Odki

Tibeto Chinese Languages

190 The only other languages spoken by any considerable number of people are those belonging to the Himalayan sub-branch of Burman-Tibeto sub-family of the Tibeto-Chinese family Such languages are Tibetan spoken by about 5,000 persons and unspecified Bhotia spoken by about 4,000 persons These two languages belong to the Tibetan group of this sub-branch while Lahuli and Kanauri belonging to its pronominalized Himalayan group are spoken by 27,000 and 26,000 persons, respectively The total number of speakers of the Tibeto Chinese languages, as already noticed, forms only 2 *per mille* of the total population The proportion of speakers of languages other than Indo-European and Tibeto Chinese is thus only 1 *per mille*

We can now take up the individual distribution of the most important languages The Linguistic Map in the beginning of this Chapter shows by means of rectangles the number of persons speaking the different languages in each district and state of the Province, and gives a fair idea of the linguistic distribution Languages spoken by less than 5 per cent of the population in each area have been omitted The Map also shows bilingualism by means of double hatching, or in other words by the hatching representing a subsidiary language being placed over the hatching representing the mother-tongue

Linguistic Division

191 The chief languages of the Province are Hindustani, Rajasthani, Punjabi, Lahnda, Western Pahari, Balochi and Pashto Of these, Hindustani is spoken in the south-east of the Province, and on its southern border passing through Gurgaon, Hissar and Ferozepore it comes into contact with Rajasthani Punjabi is spoken in most of the Sub-Himalayan and central districts, Lahnda (Western Punjabi) in the bulk of the North-West Dry Area, and Western Pahari in the Himalayan Natural Division Balochi is in vogue in the western parts of Dera Ghazi Khan, while speakers of Pashto are found in the trans-Indus portion of Mianwali and some riparian villages of Attock

There are no sharp divisions separating one linguistic area from another, but where physical features of the country undergo an abrupt change the border

becomes well marked. For instance, the Lahnda-speaking tract is separated from the Pashto and Balochi tracts by the barrier provided in the case of the former by the Indus and in the case of the latter by the hills of the Suleman range. Similarly we find that the Punjabi-speaking tract is separated from the Western Pahari tract by the lower ranges of the Himalayas. In the south-east the Ghaggar may be regarded as the dividing line between the Punjabi and the Hindustani speaking tracts. The border lines between Punjabi proper and Lahnda and between Hindustani and Rajasthani are comparatively less distinct.

Punjabi.

102 Punjabi is spoken by 14,515 090 persons or as already remarked by 500 *per mille* of the population. The intercensal increase in the number of Punjabi-speakers in most districts is about equal to the increase in the total population, but in Kangra and the States shown in the margin there is a large decrease accompanied by a corresponding increase in the number of Pahari-speaking people. The obvious explanation is that at this census in many cases Pahari has been correctly returned as the language instead of Punjabi. Besides this, at other places on the border line the figures of Punjabi have been affected on this occasion by interchange with Lahnda as explained below.

Variations in Punjabi and Pahari, 1921—1931

Locality	Actual decrease in Punjabi-speakers.	Actual increase in Pahari-speakers.
Kangra	230,238	227,777
Mandi	66,834	66,542
Chamba	27,272	29,348
Simla Hill States	19,802	42,396

Lahnda or Western Punjabi.

103 The figures of Lahnda in Imperial Table XV are not in accordance with actual returns, but are based on an estimate carefully made. According to Sir George Grierson the dividing line between Lahnda and Punjabi passes through the districts of Gujrat, Gujranwala Sheikhupura and Montgomery. All the persons born and enumerated in the tracts, which according to Sir George Grierson's survey are Lahnda-speaking, have been treated as speakers of Lahnda even if their mother tongue as happened in most cases, was recorded as Punjabi. Our justification for this step is that the return of Lahnda in the past censuses had little value as the figures in the margin will indicate. The actual figures differed greatly from the estimates of such great authorities on the subject as Dr Jukes and Sir George Grierson due to the return of Punjabi as the mother tongue of persons who admittedly spoke Lahnda. The actual returns of Lahnda are given below and

(*In millions*).

Census.	Actual returns.	Estimates.
1881	1·9	
1891	1·4	
1901	0·8	3 to 8*
1911	4·3	6†
1921	4·3	
1931	3·1	7·4

Jukes. Punjabi and English Dictionary Preface p. iv

*Grierson. Linguistic Survey of India, Vol. VIII Part I, p. 214.

District or State affected.	PART I. Speakers of Lahnda (Actual Returns). Males.	Females.	PART II. Number of persons using Language Subsidiary to Lahnda. Total. Males.	Females.	Punjabi. Males.	Females.	Hindustani. Males.	Females.	Pahari. Males.	Females.
Punjab Province	1,859,771	1,470,371								
British Territory	1,856,534	1,470,373								
Punjab States forming political relations with the Government of India.	70	81								
Gujranwala	21	12			Not affected					
Shaikhupura	21	1			Not affected					
Gurgaon	3	1			Not affected					
Shahpur	2,228	1,998								
Jhelum	8	4	3	2	1					
Rawalpindi	1,5	13	65	14	41				3	
Attock	13	7	9	3	6	5				
Montgomery	148,977	134,41			Not affected					
Jhang	229	131			Not affected					
Dalhousie	66	45								

the difference between these and the corresponding figures in Imperial Table XV are to be added to the figures of Punjabi in order to get its actual figures Lahnda according to our estimate is spoken by 7,378,252 persons, but according to actual returns by 3,087,048 The various dialects classified as Lahnda are Lahnda proper, *Jatki* of Multan, Muzaffargarh, Dera Ghazi Khan and Jhang, *Awan-lari* and *Hindko* of Attock and Mianwali, *Pothowari* and *Jhelumi* of Jhelum *Thalochari* of Mianwali and Shahpur, *Kachhari* and *Chanhaon* of Jhang, and *Bar-di-boli*, *Landhokai* and *Jangli* of Shahpur Gujrat, Gujranwala, Sheikhupura, Montgomery and Lyallpur This list is not at all exhaustive, and in many districts several local dialects bear different names The figures of Lahnda and Punjabi can only be compared with the past when combined

Hindustani

194 The difficulties attending a correct classification of Hindustani have been considerable like those in the case of Lahnda as acknowledged in the past census reports A further complication has been introduced by the repercussions of the Urdu-Hindi controversy Hindustani is an all-embracing term, covering the language spoken in Delhi and Lucknow, the less polished speech of all the real town-dwellers to the south of Ambala and the rough dialects of the country-folk in the bulk of the Ambala Division The language spoken in rural tracts is called Deswali (meaning peculiar to the country or of the country), as opposed to Bagri other names for it in various localities are Hindustani Hindi or Urdu, or terms indicating the tribes speaking the dialect, such as *Jatki*, a term merely implying the language spoken by *Jats* All these names or the dialects returned were at the time of sorting classified into the wide term, Hindustani, and the returns represent, at least in the area where the language is indigenous, all the persons actually speaking one or other of its numerous dialects Hindustani so classified is spoken by 3,988,000 persons in the Province as against 3,561,000 speaking its equivalents, Urdu and Hindi, at the last census, an increase of 12 per cent The number of Hindustani-speaking persons in the Ambala Division is 3,182,000 as against 2,864,000 in 1921, an increase of 11 1 per cent The increase in the rest of British Territory is 38,000 or 17 8 per cent which is mainly the outcome of the Urdu-Hindi controversy and only partly due to immigration In British Territory there are 132,298 persons, who have returned their birth-place as the United Provinces or Delhi and who are evidently Hindustani-speaking Compared to this the number of those returned as Hindustani-speakers is 249,036, and though we must make allowance for the children of immigrants from those Provinces, who though born in this Province have Hindustani as their mother-tongue the large difference in the figures indicates that the Punjabi-speaking people of this Province, particularly in large urban areas, have returned Urdu or Hindi as their mother-tongue It must, however, be remarked that many Punjabi families in large towns have discarded Punjabi in favour of Hindustani, and their children would naturally return the latter as their mother-tongue

Western Pahari

195 Western Pahari is spoken by 1,691,000 people as compared with 1,097,000 at last census The main cause of the variation is, as already remarked in paragraph 192 above, the return of Punjabi in place of Pahari in 1921 by a large number of Pahari-speaking people, the other cause being, of course, the natural increase in the population The Pahari spoken in the Province is known in linguistic phraseology as Western Pahari, the Eastern being spoken in Nepal and the Central in Kumaon and Garhwal hills

Rajasthani

196 Rajasthani is spoken by 613,000 persons as against 703,000 in 1921 The main reason for the decrease is interchange of the figures with those of

Hindustani as for instance in Loharu State this language was returned in 1921 by 20,23. persons. but by none now while the figure for Hindustani has risen from 38 to 23,3 0 The variation in the returns of Gurgaon District though smaller in proportion is of even bigger magnitude Rajasthani is now returned there as mother tongue by 159 777 persons as compared to 266,209 in 1921 which means a decrease of 106 432 or 40 per cent. while the number of Hindustani-speakers has increased by 164 331 or 39·6 per cent The main dialects classified into this language are Bagri of the Ferozepore and Hissar border and Mewati or the language of the Meos of Gurgaon, among the other dialects returned in small numbers being Jaipuri, Marwari etc. The border line between Rajasthani and Hindustani would thus seem to be rather vague

Pashto.

107 Pashto is spoken by 93 000 persons as compared with 59 000 at last census The difference is mainly due to the fact that Povindahs, who migrate from the trans-frontier tracts into this Province during the winter were still present in large numbers at the time of the census which was held in the end of February about three weeks earlier than in 1921 Another reason may be the return of Pashto as mother tongue by many residents of Attock and Mianwali who speak both Lahnda and Pashto. The speakers of Pashto number 27 483 in Mianwali and 22 634 in Attock and 42 437 in the rest of the Province The other districts, which have returned Pashto as mother tongue in considerable numbers, are Multan 8 000 Shahpur and Montgomery 6 000 each, Lahore 5 000 and Dera Ghazi Khan, Rawalpindi and Bahawalpur 2 000 each. Of the persons with Pashto as their mother tongue 13 646 have returned Punjabi 1 806 Hindustani and 4 103 other vernaculars of the Province as subsidiary languages. Those who have returned Pashto as their language subsidiary to Punjabi number only 156

Baluchi.

108 Baluchi has been returned as the mother tongue of 61 000 persons as compared to 57 000 at the last census The return for Dera Ghazi Khan is 57 307 the other places with any considerable number being Multan (1 868) and Bahawalpur (1 176). The strength of the Biloch tribe in the Province is 624 695 or ten times the number of those having Baluchi as their mother tongue. This shows that the bulk of the Biloch tribe does not speak Baluchi and no doubt many persons have been returned as Biloches merely because they are camel drivers.

English.

109 English has been returned as the mother tongue of 20,204 persons as against 23 724 which is the total number of Europeans Armenians and Anglo-Indians in the Province with some of whom English is not the mother tongue. The difference is evidently due to a certain number of Indians, especially Christians, who speak English from their cradle and have returned it as their mother tongue Of the persons having English as their mother tongue 4 067 speak Punjabi 3 474 Hindustani and 410 some other vernaculars of the Province as a subsidiary language

Tibeto-Chinese Languages.

200 We have already referred to the figures of Kanauri, which is spoken only in Ba hahr and Lahuli and Tibetan, which are spoken in the Kulu subdivision of Kangra District Tibetan is also returned as mother tongue by a certain number of immigrants sprinkled here and there over the Province.

Kashmiri.

201 Kashmiri is spoken by 22 000 people as compared with 4 679 in 1921 As against this 7 691 persons have returned Jammu and Kashmir as their birth place Th increase is mainly due to the fact that th annual winter visitors from Ka hmir had not begun their homeward march at the time of the census, which was on the present occa ion held comparatively earlier

The number of persons returned as Kashmiris according to the Caste table is 202,920 or 9 times as many as those who return Kashmiri as mother-tongue, which gives an estimate of the number of persons hailing from Kashmir who have settled permanently in the Province Numerous persons with Kashmiri as mother-tongue have returned Punjabi as subsidiary language (8,269), and most of these are the Kashmiris, who have been staying for some years past in large urban areas, particularly Amritsar Hindustani has been returned by 2,268 persons and other vernaculars of the Province by 855 as subsidiary languages Kashmiri has been returned as a subsidiary language by 6,650 persons who returned Punjabi as their mother-tongue

Sindhi.

202 Sindhi is the mother-tongue of 12,000 persons as against 20,000 in 1921 The chief decrease is to be found in Bahawalpur State where their number has come down from 16,732 in 1921 to 9,328 in 1931 Of other places claiming Sindhi-speakers Lahore has 811 and Lyallpur 782, while small numbers are found in nearly all other districts and states

Nepali.

203 The language next in numerical strength is Nepali which has about 8 000 speakers As compared to this there are 7,000 persons with Nepal as their birth-place and the rest were probably born in the hills of the United Provinces, or they may be the children of Nepalis born in this Province The number of persons speaking Eastern Pahari in 1921 was 9,243 The decrease, however, may be due to the return of Pahari as mother-tongue by some Gurkhas, who could not make the enumerator comprehend the difference between the two languages, or to a decrease in the number of Gurkha units stationed in the Province at the time of the census

Minor Languages : Odki

204 Odki has been returned as mother-tongue by about 5,000 persons as against 3,000 at last census Compared to this there are 32,719 persons returned as Ods, a fact which tends to show that all Ods are not keen on the return of this language, as many of them are now regarded as permanent residents of this Province and their children have Punjabi as their mother-tongue As a matter of fact most of the vagrant tribes have their own peculiar languages besides being conversant with the language of the areas frequented by them

Persian.

205 Persian has been returned as the mother-tongue of 4,000 persons as against 2,000 in 1921 The main figures relate to Lahore (1,215), Amritsar (1,168) and Ludhiana (735) Of the persons with Persian as their mother-tongue 1,486 have returned Punjabi, 649 Hindustani and 77 other vernaculars of the Province as their subsidiary language and most of these are no doubt more or less permanent settlers in the Province Persian is spoken as a subsidiary language by 975 persons who have returned Punjabi as mother-tongue Most of these are evidently Afghan refugees, who have settled down permanently in the Punjab, particularly in Ludhiana and Lahore Those who have returned Afghanistan as their birth-place number about 15,000, but with most of these Pashto is the mother-tongue The number of persons with Persia as their country of birth is only 900

Bhili.

206 The main language among those classed as Bhili is Bawari, returned by 2,042 persons, mainly in Faridkot State The number of Bawarias in the Province is 32,527, and it is evident that most of the Bawarias are now permanent settlers in the Punjab and speak Punjabi or Hindustani This language was returned by only five persons at the last census Of course, numerous members of the Bawaria tribe have a mysterious dialect of their own, used when talking to each other

Bengali.

207 Bengali has been returned as the mother tongue of 2 667 persons as against 2,181 in 1921 Bengali-speakers are found in all districts except Muzaffargarh. The largest figures relate to Lahore (902) Simla (343), Amritsar (208), Rawalpindi (103) Sialkot (177) and Ambala (141) There are 235 persons who speak Bengali as a language subsidiary to Hindustani or Punjabi, while 4 600 persons have returned Bengal as their birth place and they evidently include some Punjabis.

Gujarati.

208. Gujarati is mostly returned as the mother tongue of Parsis or immigrants from Gujarat, Baroda, etc It is spoken by 2,821 persons as compared with 1,895 in 1921 These are scattered all over the Province the chief returns relating to the districts having cantonments. In addition, there are 91 persons who speak Gujarati as a language subsidiary to Hindustani or Punjabi.

Marhatti.

209 Marhatti has been returned as the mother tongue of 973 persons as against 1,375 in 1921 it is the subsidiary language of only 9 The decrease may be due to the larger return of Gujarati with which this language is liable to be confused by a Punjab enumerator or it may be due to the movements of the troops. The largest return of 541 is found in Lahore, there being a mere sprinkling in other districts.

Tamil and Telugu.

210. Tamil, one of the chief vernaculars of Madras, is the mother tongue of 852 persons in this Province, mainly returned from Lahore Amritsar and Rawalpindi Telugu the most widely spoken of all Madras languages, has been returned as the mother tongue of only 124 persons in this Province.

Arabic.

211 Arabic is the mother tongue of 675 persons (426 males and 249 females). The number of those with Arabia, Iraq Egypt and Syria as their countries of birth is 460 The majority of the returns are thus genuine but a number of local Muslims conversant with Arabic seem to have returned it as mother tongue instead of a subsidiary language. The chief figures of Arabic relate to Lahore (456) and Gurdaspur (53), in which Qadian (the holy place of Ahmadis) is situated. Of the persons with Arabic as their mother tongue 343 speak Punjabi and 286 Hindustani as subsidiary languages Some of these might have reversed the returns, while others with Arabic genuinely as their mother tongue have picked up the vernaculars of the Province. Arabic has been returned as a subsidiary language by 300 persons, whose mother tongue is Punjabi or Hindustani which would corroborate that some Punjabis returned Arabic as their mother tongue.

Central Pahari.

212. Central Pahari has been returned as the mother tongue of 454 persons found scattered in the Jullundur and Lahore Divisions, who are mainly soldiers or domestic servants.

Other Minor Languages.

213. The speakers of Indian languages grouped as others in the Imperial Table are Assamese 10 Burmese 196 Gondi 1 Khasi 1 Malayalam (of Malabar) 23 Oriya (of Orissa) 198 and Sanskrit 21

Other Asiatic languages returned in small numbers are Chinese 160 found mostly in Lahore and Rawalpindi Japanese 4 Javanese 7 Malayan 3 Siamese 1 Singhalese 1 Syriac 1 and Turkish 17 Persons recorded as Other Asiatics are much more numerous, but have probably returned English or some other language as their mother tongue

The figures of foreign languages found in small numbers are unspecified African (7) in Lahore and Jullundur Irish (51) mostly in Rawalpindi, and Gaelic (Scotch) (95) in Rawalpindi and Ambala. In addition to these Portu

guese (51), French (82), German (30), and Italian (26) are found sprinkled here and there Flemish is the mother-tongue of 42 persons, chiefly returned from Lyallpur, Sheikhupura, Sialkot and Gurdaspur, the persons concerned being mostly Christian missionaries

European languages grouped among 'Other languages' are Danish (1), Dutch (1), Norwegian (4), Russian (6), Spanish (6), Swedish (2), and Welsh (3)

214 As already remarked in the beginning of this Chapter, column 15 of the general schedule was meant for the entry of the language (one or more), habitually spoken by the person enumerated in addition to his mother tongue This information was intended to obtain an estimate of the amount of bilingualism The absolute figures of bilinguists, or those who speak any two or more of the main vernaculars of the Province, namely, Pashto, Balochi, Lahnda, Punjabi, Pahari, Hindustani and Rajasthani, appear in Part II of Imperial Table XV, a summary of which is quoted in the margin In addition to the figures in this table there are some people, whose mother-tongue is a foreign language, such as Gujarati or English, and who speak some of the vernaculars of this Province in every-day life On the other hand, many Punjabis with Punjabi or Hindustani as their mother-tongue speak English or some other foreign language as a matter of habit Their figures have not been tabulated, as only those languages could be considered to combine as mother-tongue and subsidiary, which exist in the Province or its immediate neighbourhood Such languages appear in the table above, but English, French and Bengali have their homes remote from this Province and they have not been taken into consideration for the purpose of bilingualism It may be remarked that Punjabi and Lahnda also do not combine as mother-tongue and subsidiary language, as Lahnda is in reality another name of Punjabi spoken in the western Punjab and cannot be treated as a distinctly separate language

Bilingualism.

Mother tongue	Subsidiary Languages							
	1-Punjabi	2-Lahnda	4-Hindustani	5-Western Pahari.	6-Rajasthani	7-Pashto	8-Balochi.	9-Kashmiri.
1								
Punjabi			121,118	2,076	377	156		6,650
Lahnda			1,716		299	6,564	57,668	
Hindustani	69,326	951		483	340	100		74
Western Pahari	3,797		6 707					
Rajasthani	8,200	3,131	3,853					
Pashto	16,033	3,567	2,370	17				
Balochi		10,599	82					
Kashmiri	9 422		3,104	1,245		24		

As already mentioned, the Linguistic map in the beginning of this Chapter shows bilingualism by the transposition of the hatching of each subsidiary language on the hatching of the mother-tongue concerned The area so double-hatched represents the amount of bilingualism It is evident from the map that the amount of bilingualism is very small The only places where there is any bilingualism worth the name are Lahore, which has a large number of immigrants, and Dera Ghazi Khan where Balochi is spoken as a language subsidiary to Lahnda and *vice versa* Hindustani is spoken as subsidiary to Punjabi in parts of Ferozepore and Patiala The use of Hindustani as subsidiary to Punjabi or *vice versa* in areas like Lahore does not indicate any real linguistic border but only the presence of immigrants from remote places Another striking thing is the almost entire lack of bilingualism in districts or states, through which the linguistic borders pass, except in the solitary case of Dera Ghazi Khan referred to above Thus Ambala and Hissar, through which passes the Punjabi-Hindustani border, show very few bilinguists, while the figures of Patiala though slightly larger probably contain a mistake

The number of persons, who speak Hindustani as mother tongue and Punjabi as a subsidiary language, is smaller than of those who speak Hindustani as subsidiary to the mother tongue, Punjabi The reason for this may be the comparative ease with which a Punjabi can pick up Hindustani, or it may be the zeal of the Punjabi to return Urdu or Hindi as his mother tongue Besides this Hindustani is the *lingua franca* in the various Provinces, and numerous educated Punjabis particularly those in large urban areas, use it as the medium of speech in their official capacity or in social intercourse

We might now examine the causes of the small amount of bilingualism on the linguistic borders. Ordinarily persons living on such borders ought to be able to speak both languages fluently The table in the margin gives the figures of speakers of Hindustani as subsidiary to the mother tongue, Punjabi and *vice versa* for the districts of Ambala, Hissar and Karnal and the States of Patiala and Jind. The figures are very small, the number of those speaking Hindustani as subsidiary to Punjabi being comparatively larger mainly due to Punjabi immigrants to these areas picking up Hindustani. The explanation is in the words of the Census Superintendent, Patiala as follows —

District or State.	Persons speaking	
	Hindustani as subsidiary to Punjabi.	Punjabi as subsidiary to Hindustani.
1	2	3
Ambala	3,634	1,322
Hissar	266	213
Karnal	1,167	301
Patiala	11,809	8,377
Jind	221	733

"Apparently it would seem likely that the people of villages situated on the border line of the linguistic blocks, should be more prone to bilingualism. But when we examine the returns, we find that contrary expectations are fulfilment however To meet the requirements of daily life, it is easier to supplement one's own language by adopting important words from the neighbours' language than to learn his language entirely Thus proximity works perhaps more to aid in corrupting the two languages than induce their learning. I am supported in his view by the statistics.

The Hindustani Punjabi, Hindustani Rajasthani and Punjabi Pahari borders pass through Patiala State and what has been remarked above in respect of Punjabi Hindustani is also true of Hindustani Rajasthani border The figures of bilingualism for the past censuses are not available, and no comparison can therefore be made.

The figures of bilingualism are of interest also from another point of view inasmuch as they indicate to what extent the persons with a foreign language as their mother tongue are mere visitors to or have developed a closer interest in this Province The figures in the margin relate to the most numerous returns The speakers of foreign languages pure and simple are probably mere visitors, while those who have picked up one of the vernaculars of this Province as a subsidiary language are semi permanent or permanent immigrant

Mother-tongue.	Total speakers.	Speakers among very secondary of the Punjab as subsidiary
1	2	3
Pushto	22,834	19,537
English	28,204	7,831
Kashmiri	21,822	11,282
Persian	4,660	2,212
Arabic	673	634

Literary Activity in Different Languages.

215 The comparative statement in the margin shows the number of newspapers and periodicals published in different languages during each census year since 1891 It is apparent that Urdu is the most popular medium of circulation for news the number of Urdu papers having risen from 64 to 273 during the last four decades. There is also a great deal of literary activity in other languages, indicative of the general awakening among the masses.

Year	Urdu.	English.	Urdu.	Gurmukhi.	Hindi.	Mixed Languages.
1	3	4	5	6	7	8
1891	74	4	64	1	3	2
1901	206	17	155	5	7	2
1911	279	23	177	17	9	1
1921	279	45	191	57	12	4
1931	279*	91	273	86	24	42

*Includes one weekly paper in Persian entitled Afghanistan which ceased publication during the year 1931.

Many periodicals are communal in their character, and these generally deal with matters concerning the community whose cause they espouse

The statistics in the above table depict the journalistic enterprise of the Province, and in 1931 the number of 'live' papers circulating in the Province was 428 including dailies, weeklies, monthlies, etc, as against 236 in 1923 The detail of the live papers together with the amount of circulation is given in the margin.

Particulars	Circulation		Total	English	Urdu	Gurmukhi	Hindi	Bilingual	Trilingual	Polyglot
	Total.	Average per paper								
1	2	3	4	5	6	7	8	9	10	11

Others	39,030	634	63	14	25	4	2	8	7	4
Total	511,360	1,197	428	60	263	38	18	18	15	8

The dailies have the largest circulation, the average working out at nearly 4,000 per paper The amount of circulation of the more prominent English and Urdu dailies during the year 1931 is noted in the margin The total circulation of the current dailies is 108,575 or one paper for every 11 literates aged 15 years and over

Name of paper	Circulation
English	
Civil & Military Gazette	12,700
Tribune	12,52[illegible]
Daily Herald	9,000
Eastern Times	3,000
Urdu

Arabic	270	Others	74
Trilingual	177		
		Total	23,991

The number of books published during the decade, 1922—31, is shown in the margin together with the languages in which they were published The detail for each year of the decade is shown in Subsidiary Table III at the end of this Chapter Over 75 per cent of the total number of books published in the Punjab are in Urdu and Punjabi, while those published in English are nearly 10 per cent The number of Urdu books has risen by about 50 per cent as compared with the previous decade

The news-agency has become greatly improved during the last decade Any important event occurring in India is in the possession of newspaper readers before sunrise on the following day, in many cases accompanied by comments offered on it by foreign newspapers Similarly, the news telegraphed from the different parts of the world is printed in the newspapers during the night and is at the disposal of readers early next morning The cricket Test matches between England and Australia are now being played in the latter country, and a full description of the day's play becomes available for newspaper readers in India early on the following morning

Two leading English dailies in Lahore have two editions, *dak* and local The former is despatched to out-stations by trains leaving Lahore at about 9 p m or later and contains all news received till dusk The local edition is completed during the night and contains all news received up to about 3 a m. The *dak* edition is available in the *muffassil* in the morning, while the local edition is in the hands of readers in Lahore before sunrise, being distributed by news-boys on cycles The price is generally one anna per copy, having come down during the last decade by 50 per cent

An innovation, introduced recently and much appreciated by the public, is for the leading English dailies to illustrate the news by means of photographs On the whole the newspapers are very much improved both in respect of the style and the matter

Some of the Urdu dailies are quite as up-to-date in the publication of the news as their English contemporaries, and have many subscribers among the people of all classes, particularly shopkeepers and businessmen. Whenever any news of special importance has to be published a supplementary edition is issued and finds a ready sale.

CHAPTER XI

RELIGION

SECTION 1.—GENERAL.

216. General. 217 Attitude of the public towards religion figures. 218. Proportion of numerical strength by religion. 219. Reveals of untouchables.

SECTION 2.—HINDUS.

220. Distribution of Hindus in the Punjab. 221. Causes of decreasing number of Hindus. 222. Child marriage and its effect on fecundity. 223. Effect of residence in Towns. 224. Effect of food on fecundity. 225. Present condition of the Hindus. 226. Brahmans, Khatri and Arora. 227 Hindu Rajputs and Jats. 228. Decrease among Hindu occupational castes. 229. Hindu castes. 230. New castes returned among Hindus at this census.

SECTION 3.—SIKHS.

231. General. 232. Variation in number of Sikhs at past censuses. 233. Sikh growth due to absorption of Hindus. 234. Percentage increase of Sikhs in smaller units. 235. Strength of Sikh sects.

SECTION 4.—AD-DHARMIS.

236. General.

SECTION 5.—MUSLIMS.

237 General. 238. Muslim sects.

SECTION 6.—CHRISTIANS.

239. General. 240. Local distribution of Christians.

SECTION 7.—MINOR RELIGIONS.

241 Jain. 242. Buddhists. 43. Zoroastrians. 44. Jews. 245. Indefinite beliefs.

References to Statistics. The numerical strength of each religion returned is given in Imperial Table XVI for each district and state and Imperial Table XIX, which is divided into two parts, gives the age-distribution of Europeans and allied races and Anglo-Indians. The distribution of the population of tahsils by principal religions is shown in Provincial Table II.

In addition to these tables, Table XVI-A, printed in part III as an appendix to the Imperial Table XVI, contains details of sects of Hindus, Muslims, Jains and Sikhs.

At the end of this Chapter will be found an Appendix, which is the key to the Social Map and four Subsidiary Tables, described below

Subsidiary Table I gives by Natural Divisions the actual number of each religion in 1931 and the proportion of each per 10,000 of the total population at each of the last six censuses with variation per cent. during each decade as well as the percentage of net variation that each religion has exhibited during the last half century

Subsidiary Table II gives by Natural Division, district and state the proportion of each main religion per 10,000 of the population for six censuses.

Subsidiary Table III gives the actual number of Christians, by Natural Division, district and state for six censuses and the variation per cent. they have shown during each decade since 1881 as well as the percentage of net variation during the last fifty years.

Subsidiary Table IV gives the distribution of 10,000 of urban and rural population by main religions for the whole Province and its four Natural Divisions.

SECTION 1.—GENERAL.

General. 216. Enough has been said in previous Census Reports on the origin and beliefs of the various religions, and it is unnecessary to traverse the same ground over again. The table in the margin shows the numerical strength of the followers of each religion (according to the present census) in the Province and its main political divisions the corresponding figures for the 1911 census are also given

Religion.	1931's Census.					
	Punjab.		British Territory.		Punjab States.	
	1931	1911	1931	1911	1931	1911
1	2	3	4	5	6	7
Muslim	12,813	14,320	11,411	12,332	1,369	1,987
Hindu	8,870	8,408	6,679	6,229	2,226	2,271
Sikh	3,167	4,872	2,294	3,864	813	1,077
Christian	333	170	329	118	4	5
Others	4	170	38	411	19	29

The Social Map in the beginning of the Report depicts the distribution of the various religions in the Punjab and what is indicated by means of coloured rectangles in that map is illustrated in figures in Appendix I at the end of this Chapter Hindus are in a majority in six districts (Hissar Gurgaon Rohtak,

Karnal, Simla and Kangra), their proportion ranging between 91 per cent (Kangra) and 65 per cent (Hissar), while in two districts (Ambala and Hoshiarpur) they are most numerous as a community, the proportion being 47 and 40 per cent, respectively Muslims predominate in 17 districts,* their proportion varying between 91 per cent (Attock) and 51 per cent (Gurdaspur), while in three districts (Jullundur Ferozepore and Amritsar) their numerical strength is greater than that of any other community, the proportion being 44, 45 and 47 per cent, respectively The Sikhs have a clear majority in no district, and in Ludhiana alone they are more numerous than Hindus or Muslims, their proportion being 47 per cent In the Punjab States Sikhs predominate in Faridkot and Patiala with proportions of 57 and 39 per cent, respectively, and Muslims in Bahawalpur, Kapurthala and Maler Kotla with proportions of 81, 57 and 38, respectively Of the remaining states Hindus enjoy a vast majority in ten, their proportion ranging between 99 per cent (Suket) and 75 per cent (Jind), and are most numerous as a community in the States of Kalsia and Nabha with proportions of 48 and 46, respectively

Conversion and Inter-marriage

It will be useful at the outset to mention two factors, which have a bearing on the population of the various communities, *viz*, conversion and inter-marriages As regards the former, the number of conversions from one religion to another is relatively small in this Province The 'Arya Samaj,' a section of Hindus engaged on such work, seems to be concentrating on the rehabilitation of the depressed classes by the process called '*shuddhi*' Among Muslims the '*Ishaat-i-Islam*' and '*Tabligh*' movements have been in existence during the last decade In the case of Christians, who owed their enormous increase during the period 1891—1910 mainly to conversion, the pace of conversion has considerably slowed down Inter-marriages and conversions on any large scale take place only between Hindus and Sikhs

A "New" Religion.

The most notable feature of the present census from the standpoint of return of religion has been the adoption of the term 'Ad-Dharmi' by numerous Chamars and Chuhras and other untouchables At previous censuses Chuhras, unless they returned some recognised religion, were always included among Hindus In this respect the instructions for the return of religion at the present census were the same as in 1921, *viz*, "All *Chuhras*, who are not Muslims or Christians, and who do not return any other religion, should be returned as Hindus The same rule applies to members of other depressed classes who have no tribal religion" Thus under the instructions if a Chuhra refused to be recorded as a Hindu he was to be so recorded in case he failed to return any *other religion* An addition was, however, made to the *instructions* by the insertion of the clause —"Persons returning themselves as Ad-Dharmis should be recorded as such" The Punjab Ad-Dharm Mandal had petitioned the Punjab Government before the census operations started in 1930, representing that the depressed classes should be permitted to return Ad-Dharm as their religion at the time of the census as they were the aborigines of India and while the Hindus kept them at a respectable distance they did not believe in the Hindu religion The President of the Punjab Ad-Dharm Mandal was informed that a clause was being provided in the Census Code requiring that persons returning their religion as *Ad-Dharm* would be recorded as such *Ad-Dharm* literally means original or ancient religion

*Lahore, Gurdaspur, Sialkot, Gujranwala, Sheikhupura, Gujrat, Shahpur, Jhelum, Rawalpindi, Attock, Mianwali, Montgomery, Lyallpur, Jhang, Multan, Muzaffargarh and Dera Ghazi Khan.

In spite of the care taken to ensure the return of definite religions, sects or castes were in some cases returned instead in the column of religion and these had to be classified at the time of sorting as most of the figures in Imperial Tables are given separately for the followers of different religions. The detail of this classification, which was made under the orders of the Census Commissioner for India is given on the fly leaf to Imperial Table XVI the bulk of the persons concerned being thrown into Hinduism, notably Radhaswami (1 125), Sansi (23 828) Brahman (3 152) Chuhra (1 911) Mehtam (7 890) and Meghwal (12,807)

Attitude of the Public Towards Religion Figures.

217 The instructions about Aryas, Brahmos and Dev Samajis were that their sect alone should be recorded in the column of religion and sect The procedure was adopted as at last census with a view to have their entries copied on slips of a distinctive colour meant for "other religions," instead of on green slips meant for Hindu religion to facilitate a detailed examination of their caste age, civil condition and literacy (as shown in Provincial Tables VIII A and XIV A in Part III) In the main tables, the figures of these sects were, of course to be included in those of Hindus. This procedure however gave rise to a misunderstanding and fears were expressed in the press that these sects were to be excluded from the Hindu religion. The Census Commissioner for India modified the instructions by laying down that if the person concerned so desired the term Hindu should be added within brackets after the sect.

In recent times the importance of the figures of religion has been greatly enhanced on account of their relation to the strength of representation of the various communities in the legislature. In fact as observed in Section 5 of Chapter I communal consciousness has been growing during the last decade and has occasionally manifested itself in rather serious Hindu-Muslim riots. The advent of the census brought in its train considerable excitement and commotion among the various communities, and the members of the depressed classes came in for a good deal of pressure at the hands of certain communities, who struggled hard to win them over to their own side and thus to add to their numerical strength.

Proportion of Numerical Strength by Religion.

218 Sikhism, seeking synthesis of mono-theism of Islam and philosophical thought of Hinduism, rising on the existing Hindu social structure, consists of Keshdharis (those who grow long hair) and Sehjdharis (those who do not grow long hair) In fact at the censuses of 1881 1901 and 1901 all those who were not the followers of Guru Gobind Singh *i.e.* those who did not grow *kes* (long hair) and abstain from smoking were recorded as Hindus A considerable number of persons returned themselves as belonging to both (83 094 in 1891 and 43 613 in 1911) and were treated in the census record as Sikh Hindus. Further a considerable number of persons would return themselves as Hindus at one census and Sikhs at the next, resulting in the actual figures and the proportion of the Sikhs and Hindus in the total population fluctuating considerably The Jains though treated as a separate religion for census purposes are practically a sect of Hindus. The other main religions are Muslim and Christian, both of which have been expanding during the last five decades the latter mainly through conversion.

In Subsidiary Table II is given the proportion of each community to the total population of each district state, Natural Division and the Province for the past five censuses. According to the table Hindus are 30·2 Sikh

[*] The persons, who have at this Census signified their adherence in some way or another to both Hinduism and Sikhism, aggregate 476,398 the 1911 Census Report, page 128, para. 224.

Religion. 1	British Territory 2	Punjab States 3
Muslim	56 54	32 53
Hindu	26 83	46 26
Sikh	12 99	20 56
Christian	1 74	00
Ad Dharmi	1 69	4
Jain	15	16

14 29, Muslims 52 4 and Christians 1 48 per cent of the total population in the Punjab Similar proportions for British Territory and Punjab States are quoted in the marginal table These percentages if compared with those of 1881 reflect an enormous change Thus Hindus in the Province have now been reduced from 43 8 per cent in 1881 to 30 2 per cent, while Sikhs have increased from 8 2 per cent to 14 3 per cent, and Muslims from 40 6 to 42 4 per cent The figures for Hindus, Sikhs and Muslims for purely British Territory have during this period altered from 40 29 to 26 83, from 6 58 to 12 99 and from 51 72 to 56 54 per cent, respectively, and for the Punjab States from 54 94, 15 41 and 29 45 to 46 26, 20 56 and 32 53 per cent, respectively Thus both in British Territory and Punjab States the population of Hindus has declined and that of Sikhs and Muslims has considerably risen

Natural Increase Among Communities.

In Section 6 of Chapter I the influence of religion on the growth of the population was briefly discussed In order to form a clear idea about the natural increase among the followers of different religions I have had compiled the recorded figures of births and deaths of each district for the last decade It is needless to go into the details of all of them, and the average birth and death rates for Hindus and Muslims are given in the table below for the six districts, which have registered the highest intercensal increase in population, the six eastern districts in which Hindus predominate, and the six western districts in which Muslims are in a great majority The rates have been worked out *per mille* of the mean enumerated population of 1921 and 1931 censuses

Districts showing the greatest absolute increase in population.	Average birth rate during the decade		Average death rate during the decade		Survival rate during the decade		Eastern Districts	Average birth rate during the decade		Average death rate during the decade		Survival rate during the decade		Western Districts	Average birth rate during the decade		Average death rate during the decade		Survival rate during the decade.	
	Hindu	Muslim	Hindu	Muslim	Hindu	Muslim		Hindu	Muslim	Hindu	Muslim	Hindu	Muslim		Hindu	Muslim	Hindu	Muslim	Hindu.	Muslim
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21
Lahore	31	40	23	30	8	10	Kangra	36	35	32	35	4		Attock	29	34	16	26	13	8
Amritsar	41	43	30	32	11	11	Ambala	37	39	31	29	6	10	Rawalpindi	29	36	21	28	8	8
Jullundur	47	43	29	25	18	18	Rohtak	44	40	37	38	7	2	Mianwali	40	42	19	29	21	13
Gurdaspur	43	45	31	30	12	15	Karnal	38	40	38	37		3	Muzaffargarh	34	32	26	28	8	4
Sheikhupura	35	42	22	28	13	14	Gurgaon	45	47	34	34	11	13	Dera Ghazi Khan	36	29	27	24	12	5
Gujranwala	34	43	25	32	9	11	Hissar	40	43	28	36	12	8	Multan	37	36	24	22	13	14

It may be observed from this table that in some localities the survival rate of the majority community is higher than that of the minority communities In some other localities we find, for instance in Attock, Mianwali, Muzaffargarh and Dera Ghazi Khan, that Hindus, the minority community, show a higher survival rate than Muslims Some eastern districts, Ambala, Karnal and Gurgaon, show a higher natural increase among Muslims It cannot, therefore, be definitely said that a particular community has a markedly higher survival rate than the other It is needless to refer to the various complications, such as large or small amount of migration among different communities, though some part of the resulting difference has been eliminated by the adoption of the mean populations of 1921 and 1931 The only conclusion that can reasonably be drawn is that the rate of variation in population depends more on the locality in which the population resides than on the religions of the people concerned. The people residing in localities like

Muzaffargarh and Karnal would in all probability increase at a much higher rate if they moved out to areas, healthier and more prosperous, and whether they are Hindus or Muslims would be immaterial. To me the figures indicate that the rural population of both these districts, Muslim in one case and Hindu in the other is being sapped of its vitality by climatic conditions and poverty The urban population, on the other hand, of these two districts, which is Hindu in one case and Muslim in the other has comparatively increased much more. Here is the direct evidence of Hindus believed to be less prolific doing well in Muzaffargarh and Muslims supposed to be more prolific diminishing there in numbers. It will, therefore, be conceded that the creed of the people has hardly any effect on the growth of the population.

The social practices in vogue among the followers of certain religions, no doubt have a bearing on the population figures. For example the presence of a large number of widows in any community must re-act on its birth-rate. The high castes both among Hindus and Muslims discourage widow re-marriage, though it is a fact that the proportion of widows among Hindus is considerably larger Polygamy exists both among Hindus and Muslims, but to a much greater extent among the latter It may be said that on the whole polygamy tends to increase the population, though it is not practised in this Province to such an extent that it will materially alter the results one way or the other

Religious proportions in Punjab States.

We can now revert to the subject of the variations in communal proportions to investigate their real cause. We may first proceed to examine the causes of fluctuations in Punjab States. In Patiala, Jind and Nabha Muslims have been increasing slowly but steadily since 1881 and their proportion has risen from 21·9 13 7 and 19·2 to 22 4 14·2 and 20·0 per cent. in the three states, respectively Such is not the case, however with the other two main religions We find that Sikhs in 1881 formed 27 8 1 7 and 29·7 per cent. of the total population in Patiala, Jind and Nabha and they have largely increased during the last fifty years to 38·0 10·3 and 33 9 per cent., respectively On the other hand Hindus, who were 50·1 84 3 and 51·0 per cent. fifty years ago have dropped to 38·2 75·0 and 46·0 per cent. respectively

Th figures quoted in the margin indicate the variation in the numerical strength of the prevailing religions in Faridkot State It is evident that while the proportion of Sikhs has gone up during the last decade from 44·24 per cent. to 50 51 per cent the increase in the proportion of Muslims is only slight i e from 29·75 per cent. to 30·37 per cent. and the proportion of Hindus has gone down enormously from 25·73 per cent to 12 69 per cent In 1901 the Hindus were 28 69 per cent of the total population so that their existing proportion is even less than half of what it was thirty years ago It appears that the Akali movement during the last decade has been responsible for a large number of persons, particularly sweepers, being returned as Sikhs instead of Hindus.

Hindus		Sikhs		Muslims	
1901.	1921.	1901.	1921.	1901.	1921.
12·69	25·43	44·24	50 51	29·75	30·37

The figures in the margin show the numerical strength (in percentages) of Hindus and Sikhs in the last six censuses in the Maler Kotla State and it is evident that the percentages of the two communities have fluctuated in a very unusual manner from decade to decade The Hindus w re 23 per cent of the total

Religion.	1921.	1911.	1901.	1891.	1881.	1881.
1	2	3	4	5	6	7
Hindu	24	17	23	50	51	23
Sikh	33	27	30	14	10	40

population in 1881, and jumped to 53 per cent in the next ten years During the intercensal period, 1901—11, their proportion came down from 50 per cent to 32 per cent It rose a little in 1921, but during the last decade it has dropped to 26 per cent, so that the Hindus are practically where they were fifty years ago On the other hand the Sikhs were 40 per cent of the total population in 1881, but during the next ten years 75 per cent of them seem to have disappeared In 1911 their proportion was 30 per cent, it decreased slightly in 1921 and is now 35 per cent According to the Census Superintendent, Maler Kotla State, "this fluctuation is mainly due to the fact that prior to the communal dissensions, which have lately arisen among the various communities in British India and Indian States, the members of each community had very little regard for holding a separate position of their own" He adds "the Sikhs of Maler Kotla State, who are chiefly Jats, used to consider themselves part and parcel of Hindus and made no distinction between Hinduism and Sikhism It is only recently that they have drawn a line of demarcation between themselves and the Hindus and have shown a tendency to be treated as a separate community"

The main conclusion is that the varying strength of the population returned as Hindu or Sikh in the Punjab States is due to social causes that are at work in that section of the population, from which both Hindus and Sikhs are drawn The Akali movement during the last decade is mainly responsible for numerous persons being returned as Sikhs instead of Hindus Such persons for the most part comprise members of depressed classes, agriculturists and artisans in rural areas, who obviously consider that they gain in status as soon as they cease to be Hindus and become Sikhs

An indication of this is furnished by the variation in the numerical strength of many occupational castes and certain tribes, such as Jat, Saini, Rajput and Arora, whose members are returning themselves in increasingly large numbers as Sikhs instead of Hindus, particularly in the districts and states of the central Punjab There are certain other tribes, such as Chuhra and Chamar, who chafing under the label of untouchability prefer Sikhism to the caste-ridden Hinduism To illustrate this point we might quote the figures of an agricultural caste known as Saini in the central Punjab and Mali in the eastern Punjab and claiming adherents both among Sikhs and Hindus The table in the margin shows the distribution of one thousand of this tribe for the three decades since 1911 In column 7 is given the present strength of the tribe, enumerated in each district or state, assuming that all Sainis and Malis in the Province numbered 10,000 A glance at the table will show that Hindu Malis predominate in Gurgaon, Hissar and Rohtak, though Hindu Sainis have increased at the expense of Malis during the last decade In Karnal Hindu Malis have decreased, while Hindu Sainis and Sikh Sainis have

District	Census year	Hindu		Sikh		Number per 10,000 Sainis and Malis in the Punjab
		Mali	Saini	Mali.	Saini.	
1	2	3	4	5	6	7
Gurgaon	1911	1,000				
	1921	998	2			
	1931	972	28			435

	1931		478		522	1,697
Jullundur	1911		400		598	
	1921	1	334		665	
	1931	1	175		828	606

increased. In Ambala Hindu Mahs have decreased and Sikh Sainis have nearly doubled while Hindu Sainis also show an increase. In Patiala Hindu Sainis have decreased and Hindu Mahs have entirely disappeared resulting in a corresponding increase in the number of Sikh Sainis. In Jind, up to 1921 Hindu Mahs predominated but at the census two-thirds of them have returned themselves as Sikh Sainis. In Hoshiarpur and Jullundur there are no Mahs but Hindu Sainis show a decrease in both the districts while Sikh Sainis have considerably increased during the last decade. The conclusion to be drawn from these variations is that Mahs prefer to be known as Sainis while Sainis by becoming Sikhs, particularly in the districts and states of the central Punjab consider their social status improved if they return themselves as Sikhs instead of Hindus. It may be pointed out that despite all these changes the population of Mahs and Sainis has been steadily increasing if the two castes are taken together. The figures appear in Table XVIII but are reproduced in the margin for ready reference

Caste	1881.	1891.	1901.	1911.	1921.	1931.
1		3	4	5	6	7
Mali and Saini	203,533	16,496	227,678	204,642	213,990	279,899
Mali	56,072	93,900	106,906	96,823	92,933	72,299
Saini	147,183	129,807	121,722	107,799	120,978	157,301
Hindu Mali and Saini	198,125	194,867	208,787	183,417	187,600	143,225
Sikh Mali and Saini	14,436	17,980	20,376	44,646	51,888	82,943

Reasons for Change of Religion.

The main cause for the discarding of Hinduism by some of the agricultural and artisan classes in the central and eastern Punjab is the enhanced prestige gained by agricultural tribes in the countryside by their becoming Sikh. In the instance, quoted in the last paragraph, a Mali gains in prestige by becoming a Saini Mali being a distinctly inferior term. The Jat in Jullundur and Hoshiarpur if a Hindu, is looked down upon by his Hindu Rajput neighbour and so he becomes a Sikh. On the other hand in the south-east of the Province *i.e.* in Rohtak, Hissar and Gurgaon, a Hindu Jat takes a pride in his caste and even looks down upon a Brahman, who in those districts is not a priest but like him a tiller of the soil. Similar influences are operative in the case of such tribes as *Tarkhan* (carpenter) *Lohar* (blacksmith) *Julaha* (weaver) *Sunar* (goldsmith) and *Nai* (barber) as we shall see in Chapter XII on Castes.

Revolt of Untouchables.

219 There has been in the last few years a movement among the untouchable classes to organise themselves as a separate community in order to consolidate their position, and many of them have returned themselves particularly in the central districts, Jullundur and Hoshiarpur as Ad Dharmi or the followers of Ad Dharm, meaning the ancient or original religion of Hindustan. The figures of Ad Dharmis are given in the margin for the districts returning more than 100 of them. The south-eastern districts of Rohtak, Hissar and Gurgaon, where Hindus are in a majority have returned very few Ad Dharmis, while the district with predominantly Muslim population such as Attock, Rawalpindi, Mianwali, Jhelum, Jhang, Muzaffargarh and Dera Ghazi Khan, have no Ad Dharmis at all.

District.	Persons.	District.	Persons.
1	2	1	2
Jullundur	113,800	Gurdaspur	4,845
Hoshiarpur	111,879	Karnal	3,011
Ludhiana	39,719	Multan	2,277
Ferozepore	34,742	Shahpur	1,881
Kangra	29,803	Gujrat	1,010
Lyallpur	17,729	Lahore	1,004
Montgomery	16,179	Amritsar	164
Shahpur	11,741		

We shall now proceed to study the numerical strength of each religion and the variation in its figures at various censuses.

SECTION 2.—HINDUS.

Distribution of Hindus in the Punjab

220. The blue portion of the rectangles in the Social Map represents Hindus and the light-blue Ad-Dharmis and Hindu depressed classes It will be seen that Hindus are most numerous in the Himalayan Natural Division, constituting 9,325 of every 10,000 of the total population In the Indo-Gangetic Plain their proportion is 3,504, in the Sub-Himalayan 2,235 and in the North-West Dry Area 1,280 In the margin are given the absolute figures of the number of Hindus in the Punjab and in each Natural Division for 1921 and 1931 and the percentage of increase or decrease at this census is compared with the increase per cent in the total population of all religions

Locality	Actual number of Hindus with 000's omitted		Increase or decrease per cent	Increase per cent in total population of all religions
	1931	1921	1921—31	
1	2	3	4	5
Punjab	*8,600*	*8,800*	*—2 3*	*13 5*
Indo-Gangetic Plain	4,510	4,736	—4 8	11 4
Himalayan	1,708	1,642	+4 0	5 4
Sub-Himalayan	1,445	1,557	—7·2	11 9
North West Dry Area	937	865	+8 4	21 5

It will be seen that Hindus in the Province have decreased, as also their proportion in the total population They have, however, shown actual increase in the Himalayan Division and in the North-West Dry Area In the other two Divisions the Hindu population has decreased, more particularly in the Indo-Gangetic Plain A direct cause of the decrease is that over 4 lakhs of persons, belonging to the backward classes, returned their religion as Ad-Dharm, but even supposing that all of them had returned themselves as Hindus (though quite a considerable number of them would beyond doubt have been claimed by Sikhism) the Hindus as a whole would not have shown the same amount of increase as the other main religions

Causes of Decreasing Number of Hindus

221 The decrease in the number of Hindus requires careful examination Some of the main causes for the decrease in the Hindu population at every census have been noted in the general remarks preceding this section What we are here concerned with is to determine whether Hindus are really suffering from any peculiar handicap which keeps down their number and does not let them grow at the same rate as some of the other communities in the Punjab do Pandit Hari Kishan Kaul in his Report on the 1911 Census enumerated the causes, which in his opinion were responsible for a smaller rate of growth among Hindus as compared with other religions In addition to the causes peculiar to the decade 1901—11, such as the earthquake of 1905 in Kangra the famine in Hissar District and the outbreak of plague, which was alleged to have caused a greater number of deaths in urban areas where a greater proportion of Hindus lived, he laid particular stress on " (*i*) restriction of fecundity by enforced widowhood, (*ii*) the evil effects of early marriage on prolificness, (*iii*) loss of vitality in consequence of the occupations and habits of the Hindus in towns, (*iv*) and the difference in food " Of these four causes, which might be regarded as more or less permanent in their nature, the first was examined in detail in the Chapter on Civil Condition, and here it will suffice to say that the number of widows of child-bearing ages (15—40) among Hindus is 37 *per mille* of all females as compared with 22 among Muslims and 19 among Sikhs. There is thus no doubt that the number of widows among Hindus is comparatively large and would have a somewhat adverse effect on their population but the number of children in each community ought to depend on the number of married females of child-bearing ages and their proportion is higher among

Hindus than among Muslims or Christians. Among Hindus out of every 1 000 women aged, 15—40 855 are married as against 862 among Sikhs, 798 among Jains, 838 among Muslims and 800 among Christians Thus one factor is more than counteracted by the other and we shall examine the other three causes and see whether they can account for the decrease.

Child Marriage and its effect on Fecundity

222 The true extent of child marriage and its effect on prolificness could not be gauged at past censuses as the Age and Civil Condition tables used to have many defects on account of the plumping on figures at certain ages, which were never smoothed. This defect was admitted in the Census Reports of the past with regard to entries about age in particular Nor was it possible to know the number of children born to women married at different ages. At the present census a special enquiry was held with a view to obtain more reliable fertility statistics, and the results of that enquiry are given in the form of six tables five of which have been printed and discussed in Chapter VI (Civil Condition) This enquiry as explained there, was as a rule made in typical areas in the various districts and states, and all the families with the husband and wife alive were examined. A record of more than 60 000 Hindu families was made as also that of 25 000 Sikh and 75 000 Muslim families and some Christian and Ad Dharmi families. A reference may be made to the discussion in paragraph 114 of Chapter VI where the conclusion has been recorded that Hindus including Sikhs were actually more prolific than Muslims or Christians, but had a smaller survival rate The prevailing custom of early marriage cannot be held responsible for this result, as will be seen from an extract from Fertility Table III reproduced in the margin The curious fact brought out by these figures is that among both Hindus and Muslims the rate of survival is highest among children whose mothers were below 12 when married. The date of marriage for the purpose of this enquiry was reckoned from the time the wife came to live with her husband which generally coincides with the appearance of the first signs of puberty The high survival rate can either be taken at its face value and looked upon as a result of some physiologically sound reason of which we are hitherto unaware or we may assume that only the physically strong women have survived early labours to be included in our enquiry and have transmitted some of their hardy qualities to their progeny These doubts however will be dispelled by table in the margin which shows the number of Hindu females with different durations of marriage per 1 000 females married at each of the specified age-periods.

Age of wife at marriage	Hindu.		Muslim.		Sikh.	
	Average number of children born to 100 women.	Number of surviving children per 1,000 born.	Average number of children born to 100 women.	Number of surviving children per 1,000 born.	Average number of children born to 100 women.	Number of surviving children per 1,000 born.
0—13	241	741	224	724	213	715
13—14	329	724	303	723	273	760
15—19	389	722	372	716	404	716
20—29	309	711	443	722	472	722
30 and over	276	727	431	749	371	748

Duration of marriage per 1,000 Hindu women married at each age-period.

Age of wife at marriage	0 to 4	5 to 9	10 to 14	15 & over
1	2	3	4	5
0—12	52	153	276	607
13—14	92	177	218	513
15—19	94	157	195	552
20—29	67	143	274	516
30 and over	44	92	218	644

It is evident that of 1 000 women married below the age of twelve 607 have had at the time of the enquiry a duration of marriage of 15 years and over This proportion is the highest except in the case of those who were married when 20 and above The data for the latter are of course not reliable because if they were married when over 30 many of them must now be over 60 which is the period of life when the people in this Province are prone to return a

wrong age Moreover, the actual number of cases is very small, and most of them probably concern widows who have remarried their deceased husbands' brothers and would as often as not return the duration since their first marriage as well as all the children they have borne

It may be argued that women with the longest duration of marriage at the present moment must comprise a large proportion of those who were married when very young, as they alone could have to their credit the longest durations in married state In this connection it may be pointed out that the duration of 15 years and over is in no way excessive, and women married at higher ages had an equal opportunity of completing this duration The figures in the margin show the number of Hindu women in our enquiry who had completed different durations of marriage, their total being assumed as 10,000 It will be seen that the predominating duration is 15 years and over, which claims more than half the women married at different ages If we reduce the number of all marriages with this duration to 1,000, we find that it comprises wives married at different ages as shown in the margin The figures for the other prevailing religions have been inserted for the sake of comparison

Number per 10,000 Hindu wives who have duration of marriage

Years	0—4	5—9	10—14	15 & over
1	2	3	4	5
Number	812	1,535	2,040	5,613

Number per mille of women married for 15 years or more who were married at —

Religion	0—12	13—14	15—19	20—29	30 & over
1	2	3	4	5	6
Hindu	214	213	407	133	3
Muslim	174	167	414	212	33
Sikh	180	183	459	159	19

No further discussion on these lines is necessary, as the subject has been fully dealt with in Chapter VI, but it may be useful to mention that the number of child-wives with the longest duration of marriage would be even larger but for the fact that many of them have been excluded from our enquiry owing to the death of their husbands

Effect of Residence in Towns

223 Subsidiary Table IV to this Chapter gives the proportion of followers of different religions living in towns A comparison of this table with the corresponding table of 1921 shows that Hindus now constitute 37 64 per cent of the urban population as compared to 40 21 per cent in 1921 The proportion for rural areas, which contain nearly nine-tenths of the total population, shows even a greater decrease, *i e*, from 34 46 per cent to 29 13 per cent The proportion that Hindus constitute per 10,000 of the rural and urban population in each Natural Division is reproduced in the marginal table We find that there is an actual increase, though only slight, in the proportion of Hindus in the urban population of the Himalayan Division and North-West Dry Area The proportion of Hindus in the rural population has been reduced everywhere, indicating that the cause for decrease in the number of Hindus is not to any large extent "the loss of vitality in consequence of their habits as the residents of towns"

Number of Hindus per 10,000 of

Natural Division	Urban Population		Rural Population.	
	1931	1921	1931	1921
1	2	3	4	5
Punjab	*3,764*	*4,021*	*2 913*	*3 446*
Indo-Gangetic Plain	3 797	4,156	3 445	4,134
Himalayan	7,451	7,178	9,388	9,526
Sub Himalayan	3,224	3,482	2,117	2,584
North West Dry Area	3,891	3,793	1,032	1,236

It has been observed in the past, and the point was stressed in the 1911 Census Report, that towns had a higher death-rate than villages and therefore

Hindus who predominate in urban areas were subjected to a higher death-rate. Conditions to-day are however different to those prevailing twenty years ago and the death-rate for some of the leading towns in which the greatest proportion of Hindus is found is actually smaller as compared to rural areas. The published mean death rate for urban areas during the last decade is 31·9 *per mille* of the population and for the rural 30 1 *per mille* These death rates are calculated on the basis of the 1921 population, and the urban death rate would be actually smaller if the intercensal increase of population in towns, which is 28 3 per cent. as against 12 per cent. in rural areas, was worked out from year to year and the death rate calculated on its basis. Thus mere residence in towns does not appear so serious a drawback from the standpoint of health as it is sometimes supposed to be

Effect of Food on Fecundity

224. The subject of the effect of food on fecundity is no doubt very complex. The Census Report of 1911 while admitting that the question of food was a very debatable one goes on to say "the Hindu on the whole is a vegetarian and abstains not only from meat but also from eggs, and, in most cases, from such stimulating spices as onions and garlic. A number of Hindus, particularly in the towns, eat meat, but the percentage of such people is small. In the rural tracts the meat-eaters whether Hindus or Muhammadans, live mostly on vegetarian and milk diet, using meat occasionally by way of a change. The staple food-stuffs, therefore, are wheat and pulses, and the Hindu rural population does not appear to be worse off in this respect than their Muhammadan brethren. The fondness of the Muhammadans for food is proverbial On the other hand, the Hindu townsman usually exercises more economy in the matter of food than in any other direction. Leaving alone the more wealthy merchants and property-owners, the average townsman usually has one full meal in 24 hours. The second meal is very often a makeshift, either obtained at the place of business or served at home late at night The meal is usually composed of *chapatis* and *dal* or some vegetable curry The *chapatis* are sometimes eaten with a little pickle or with sour milk or perhaps with *pakauras* or some similar cheap indigestible stuff sold by the confection rs." After referring to the reduction in the supply of milk and *ghee* the Report adds that the food of the Hindu towns-people is deteriorating further

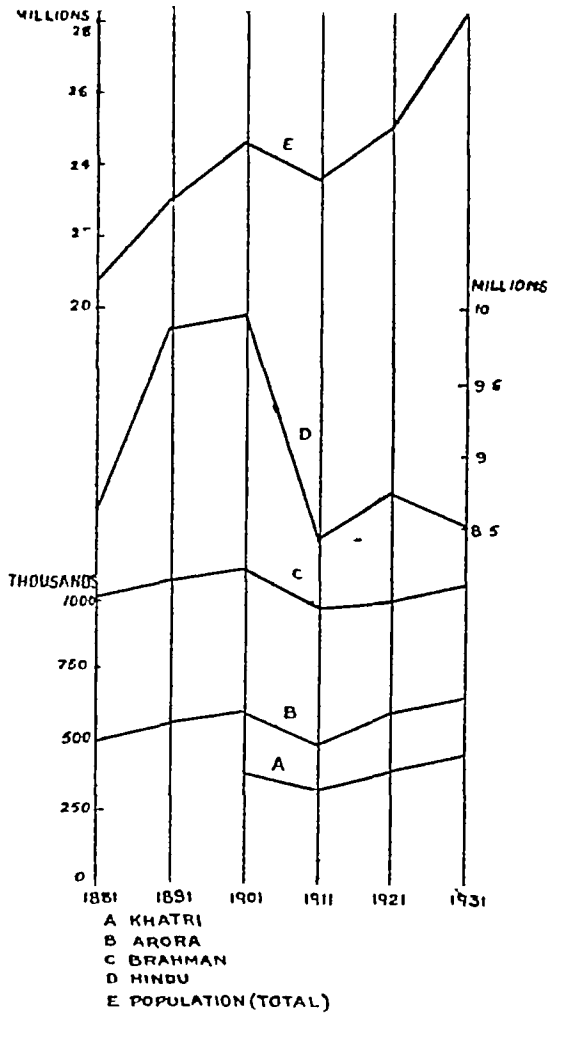

It is, however a matter of common knowledge that in recent years the food of the Hindu towns-people particularly of the middle class in large towns has shown a distinct improvement. The remark about the Muslims in the above quotation is, of course only a side-issue and evidently applies to a small section among them, and is perhaps with equal force applicable to the Hindu property owners and wealthy merchants. The above quotation, however makes it clear that the food of the Hindu and the Muslim country people is about the same It i therefore rather difficult to comprehend that the decrease among the rural Hindus i due to any difference in food. The large majority of Mu lims are rural and it is the total of rural population whether Hindu Sikh or Muslim, that is responsible for the major proportion of the provincial increase

In this connection the following extracts from Pell s Law of Births and Deaths will be of interest On page 109 he says Well fed and mentally active people of the town will be relatively infertile Well fed and sluggish country people will be relatively fertile But in the case of poorer townspeople the effects of greater nervous activity will ina large measure be counteracted by bad feeding and overwork. While referring to the severity of the

tests, carried out by Dr Chalmers Watson, Pell quotes him from "The Declining Birth-rate to the effect that a purely meat diet produces sterility more or less complete in animals This would tend to show that the stinginess of the town-dwellers in the matter of diet does not militate against fecundity

Present Condition of the Hindus.

225 We will now proceed to examine whether the Hindu community as at present constituted is vitally inferior to others According to Sundburg, well-known authority on age statistics, the progressive population must have 400 persons per 1,000 in age-group 0—15 500 (or about one-half of the total population) in age-group 15—50 and 100 in age-group 50 and over (see page 133 of the India Report of 1921) Applying this test to the figures of Hindus we find that they point to progressiveness Any community with a lesser number in the younger age-periods and a greater number in the older age-periods is stationary if persons aged 0-15 are 33 per cent, and actually regressive if they are less

Brahman, Khatri and Arora

226 We should not rest satisfied only with the application of a mere formula, as done in the last paragraph, but will study the figures of certain main castes of Hindus, Brahman, Khatri and Arora, which at present form 122, 54 and 77 *per mille* of the total Hindu popuation, respectively The graph in the margin depicts the growth of these castes from 1881 to the present day The figures will be found in Imperial Table XVIII, and except for a big drop in 1911, which is also reflected in the curves of the total population, the three castes have shown a steady increase in numbers though not at the same rate as the total population This was not to be expected for the various causes already alluded to The increase in the strength of these three castes during the last decade may be examined in greater detail The present figures are given in Table XVII, and the increase per cent for the decade in the Province as well as for each Natural Division is given in the margin for the total strength of these castes as well as for persons of these castes professing Hindu religion. The figures for Hindu Brahman are almost exactly the same as those

Increase or decrease per cent. in population of certain castes

Locality 1	Brahman 2		Khatri 3		Arora. 4	
	Total	Hindu	Total	Hindu	Total.	Hindu
Punjab	*+6 1*	*+6 0*	*+13 2*	*+17 3*	*+8 4*	*+11 2*
Indo-Gangetic Plain	+5 9	+5·6	+21 7	+19 9	+11 5	+9 2
Himalayan	+7 9	+7 9	+1·7	+1 3	—2 7	—10 4
Sub-Himalayan	+3 6	+3 8	—4 0	+8 7	—15 9	—1 0
North West Dry Area	+11 4	+11 3	+26 8	+2 73	+11 1	+12 9

for total Brahman, as very few Brahmans belong to any other religion unlike Khatris and Aroras, a considerable number of whom, particularly Aroras, are Sikhs. The reason for the decrease in the Hindu Arora in the Himalayan Division being greater than the decrease in the total Arora is that some Aroras, who formerly returned themselves as Hindus, have now returned themselves as Sikhs and omitted to return their caste. Khatris show a decrease of 4 per cent. in the Sub-Himalayan Division, while Hindu Khatris are making a steady progress a similar progress among Sikh Khatris has been concealed by an omission to return the caste.

Hindu Rajputs and Jats.

227 The figures of Hindu Rajputs and Jats, who number 577,374 and 992,309 respectively in the Province have not been discussed along with the figures of the three castes dealt with in the last paragraph Rajputs now include an ever increasing number of some occupational castes except perhaps in Hoshiarpur and Kangra, and many Hindu Jats have returned themselves as Sikhs except in Gurgaon, Hissar and Rohtak. The figures of these tribes in the above-mentioned localities are shown in the margin, and the figures of the Karnal Jats have also been added It will be seen that Jats have increased in Gurgaon by a higher rate than the total population. In Hissar too the increase is fairly high while Jats have decreased in Karnal no doubt due to the bad climate and malaria prevalent in rural areas. The small rise in Rohtak can only be explained by the population having outgrown the means of subsistence and the emigration during the last decade to canal colonies, which have attracted Hindu Jats of the eastern Punjab for the first time.

Caste and District.	Per 1,000 of Hindus in 1921.	Percentage increase or decrease.	Percentage increase of total population.
1	2	3	4
Hindu Rajput.			
Kangra	300	+5·5	+4·6
Hoshiarpur	57	+3·6	+11·3
Hindu Jat.			
Gurgaon	96	+9·7	+8·6
Hissar	207	+7·6	+16·1
Rohtak	224	+1·7	+4·2
Karnal	117	−2·9	+2·9

Decrease Among Hindu Depressed Castes.

228 In addition to the large number of conversions to Sikhism from amongst the Hindu agricultural castes and depressed classes, numerous persons belonging to occupational castes have obviously gone over to the Sikh religion. Fuller details will be found in Chapter XII on Castes and Tribes, and here it will suffice to mention that several *dhobis* (washermen) *darzis* (tailors) carpenters, masons and goldsmiths, who formerly returned themselves as Hindus, have now returned themselves as Sikhs for in no other way can we explain the defect among Hindu members of these particular castes when accompanied by an almost equal increase among Sikhs.

Conclusions.

From what has been said above we can draw the following conclusions —

(*a*) An increasing number of Hindus belonging to agricultural occupational and depressed classes have returned their religion as Sikh or Ad Dharmi.

(*b*) So far as the natural increase is concerned Hindus are almost as progressive as the other communities in the Province

(*c*) If the Hindu, Sikh Jain, Buddhist and Ad Dharmi or in other words the units within which all the variations take place are grouped together the increase in their number since 1911 is consistent with the rate of increase that could be expected under the circumstances

(*d*) In the future a still further reduction in the number of Hindus due to further desertions may be expected unless the lower middle agricultural tribes and members of occupational castes and untouchables can be induced to stay in the Hindu fold.

Hindu Sects

229 The Hindu sects can be grouped under six main heads*—(1) Old Sects, (2) Reformers, (3) Sects essentially of low castes, (4) Miscellaneous Sects (5) Sects analogous to other religions, and (6) Unspecified The sects falling under the first group can be further sub-divided into (*a*) Orthodox Hindus, (*b*) Religious orders, (*c*) Saint worshippers, and (*d*) Sects worshipping Muslim saints in addition to their own gods, while the sects comprised by the group "Miscellaneous Sects" can be sub-divided into (*i*) Minor Sects and (*ii*) Castes returned as sects

The sects included in each group are noted below —

1 Old Sects

(*a*) *Orthodox Hindus*
- Sanatan Dharm*

(*b*) *Religious Orders*
- Bairagi
- Udasi
- Faqir
- Sanyasi
- Jogi
- Gorakh Panthi

(*c*) (*i*) *Saint Worshippers*
- Dadu Panthi
- Guga Pir
- Kalu Panthi
- Namabansi
- Pabuji
- Panjpiria
- Rai Dasia
- Ram Raya
- Sewak Darya

(*ii*) Those who worship Muslim saints in addition to their own gods
- Sarwaria and Shamsis

2 Reformers

Arya, Brahmo, Dev Dharm, Nanak Panthi and Radhaswami

3 Sects of Low Castes

Balmiki, Lal Begi, Ram Dasia and Bala Shahi

4 Miscellaneous

(*a*) *Minor* —The less numerous and unimportant entries are included under Miscellaneous

(*b*) *Castes returned as sects* —Sansi and Od

5 Sects Analogous to other Religions

Jain, Budh, Namdhari, Kesdhari, Sehjdhari Ad-Dharm etc

6 Unspecified

Strength of Hindu Groups

The absolute strength of each group together with its sects is noted below for the censuses of 1921 and 1931, as also the percentage of variation

Variation in the Strength of Hindu Sects

Sects	1921	1931	Variation per cent
1	2	3	4
All Sects	8,799,651	8,599,720	—2·3
1 Old Sects	7,614,435	7,600,641	— ·2
(a) Orthodox Hindus	7,385,196	7,567,735	+ 2·5
Sanatan Dharm	7,385,196	7,567,735	+ 2
(b) Religious Orders	22,509	5,232	—76·8
Bairagi	4,407	760	—82·8
Udasi	2,651	2,503	— 5·6
Faqir	10,[illegible]	218	—[illegible]
Sanyasi	1,381	646	— 53·2
Jogi	3,228	473	—85·3

(b) Castes returned as sects			
Sansi	21,[illegible]29	[illegible]2,564	[illegible]
5 Sects analogous to other religions			
Jain	[illegible]4,[illegible]	[illegible]7,[illegible]	[illegible]
6 Unspecified	[illegible]1,[illegible]	[illegible]12,[illegible]	—1,[illegible]

*[illegible] Census Report 1931 p 116

The group Old Sects comprises the bulk of Hindu population, i.e., 88 38 per cent of the total as against 86 53 per cent. at last census. Of this orthodox Hindus or Sanatanists claim 88 per cent. and sects worshipping saints and sects falling under the sub-head Religious Orders" claim the remaining 38 per cent. It is noteworthy that while orthodox Hindus show an increase all the other sects falling under Old Sects with the exception of Udasi show an enormous decrease. The only conclusion is that either the members of these sects returned themselves as Sanatan Dharm or no sect at all. The strength of the group "Reformers" has more than doubled since last census, and is now 5 6 per cent. of the total population. Of the total number of Reformers, which amounts to 478 000 the Arya or Vedic Dharm has 470 000 followers. In 1911 the total number of Aryas was less than one lakh and rose to over two lakhs at last census, and it is now close upon half a million. On the other hand Brahmo Dev Dharm and Nanak Panthi show a decrease. Brahmos are to be found mostly in the urban areas of certain districts and at last census too their population had declined. Dev Dharm is also a sect of recent origin, being founded in 1887 and the number of its followers though larger than that of Brahmos is not considerable. The instruction to the enumerators at last census was that in the case of Dev Samajis the name of the sect should be entered without the addition of religion. On the present occasion this instruction was modified and enumerators were required to enter the term Hindu after the name of the sect, if so desired by the person enumerated. This might in some cases have resulted in the religion being entered as Hindu without the addition of sect. The decrease among Nanak Panthis is evidently due to many of them having been returned as Sikhs, Nanak Panthi being mainly a Sikh sect. Radhaswamis show a large increase since last census.

The figures for the group Sects of low castes show a large decline as compared with last census, evidently because numerous members of these castes have returned themselves as Ad Dharmi or Sikh There is a tremendous rise in the figures for the Unspecified probably because a tendency was noticeable in many places at this census to return no sect with a view to consolidate the position of the community

New Sects Returned Among Hindus at This Census.

230 The tenets of the various sects of main religions have been fully described in the Census Reports of the past, especially in those of 1891 and 1911 and a repetition here is unnecessary Important variations in their numbers have been pointed out and below is given an account of certain sects returned for the first time on the present occasion.

Kabir Panthi. (Hindu & males.)

This sect is a section of Kabir Panthis, and its members are the followers of Kabir Bhagat They also believe in Gugga in whose name a fair is held at Meru in the Bikaner State In the matter of dress and food they are akin to the people of the United Provinces, and their religious ceremonies are the same as those of other Hindus. They are found only in Hissar District and their occupation is shoe making and their mother tongue is Purbi, a corrupt form of Urdu.

Mugal Khel. (Hindu & females.)

They follow Sanatan Dharm, and their occupation is shoe-making

Ram Dev. Hindu 99 males and 1?? females.)

The sect has been in existence for the last three or four hundred years and its members are the followers of Ram Deoji Pir Their holy place is Ruhi ha in the Jodhpur State where the most important fair of the sect is held. Their religious ceremonies do not materially differ from those of other Hindus.

Ram Dalji (Hissar, 15 males and 18 females.)

Ram Daiji is the name of a Hindu deity and the persons returned as members of this sect really belong to Sanatan Dharm

Singi Kat (Hissar, 10 males and 13 females)

Singi Kat is the profession of certain persons who extract blood from sick persons with the aid of *singi*, a small horn-shaped instrument made of horn and iron The persons entered as members of this sect are really Sanatan Dharmis

Dhawal Pal and Dharm Premi.

Dhawal Pal and Dharam Premi are two different names for the Brahmanic Hindus and Vedic Dharmis, respectively The members of these sects are found only in the Sialkot District, their total number being less than 500

Bishkarman (Ludhiana, 29 males and 14 females.)

The followers of Bishkarman, a Brahman, who married a woman of another caste, are usually *Lohars* and *Tarkhans* They have a temple of their own on the Phagwara-Nawanshahr road in the Jullundur District, but in practice they are Sanatan Dharmis

Ram Shahi (Bahawalpur State 58 males and 45 females)

The founder of this sect is reported to be one Ram Pir, but the date of its origin is not traceable Their particular beliefs and tenets are analogous to Hinduism They pray like Hindus, and their religious books are in Shastri, Urdu or Gurmukhi In their dress and mode of life they are just like other Hindus They do not eat bacon and they bury their dead Rama Pir's shrine is in the Jodhpur State, and a fair is held there during the months of *Bhadon* and *Magh* and draws thousands of members of this sect from the various parts of India

Gahhar Ghambir (Ambala, 15 males and 22 females)

Swami Bishan Dass, who is over 70 years old, is the founder of this sect His disciples believe in the doctrines of the ten Gurus of Sikhs, and are also known as Nanak Panthis The following places are held sacred by them —

(1) Rupar (Ambala District), (2) Sirhind Basi (Patiala State), (3) Machhiwara (Ludhiana District), (4) Badla (Patiala State), and (5) Chak No 389 G B (Lyallpur District)

The name of this sect, which is one of the names of the Almighty, literally meaning "Deep, Profound," has been derived from a *shabad* (hymn) contained in the Granth Sahib (the holy book of Sikhs)

Kanthiwal (Karnal, 51 males and 42 females)

They are really Jhiwars, and the founder of the sect was Baba Kalu, a Jhiwar who lived in the time of Akbar the Great The successor of Baba Kalu pays a half-yearly visit to the members of the sect, and gives them a *kanthi* (necklet) to wear They have a temple in Bhalwal and another in Patangarh, both in Karnal District, and usually follow Hindu religion and observe the same fairs and festivals as other Hindus Their peculiarity is a worship of wells

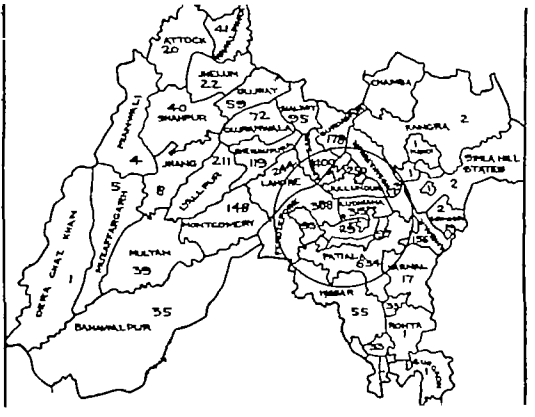

SECTION 3.—SIKHS.

General.

231 The followers of Sikhism at the present census number 4,071,624, of whom 2,270,946 are males and 1,800,678 females, giving a proportion of 793 females per 1,000 males During the last decade Sikhs have increased by 964,328 or by 31 1 per cent The principal figures for important units are given in the margin A glance at the Social Map in the beginning of this Report will show that Sikhs reside chiefly in the central Punjab, being most numerous in the territory which is marked

Locality	Absolute figures of Sikhs (1931)			
	Persons	Males	Females.	Proportion of females per 1 000 males
1	2	3	4	5
Punjab	*4,071,624*	*2,270,946*	*1,800,678*	*793*
British Territory	3,064,144	1,703,584	1,360,560	799
Punjab States Agency	996,626	561,238	435,388	776
Other Punjab States	10,854	6,124	4,730	772

out roughly by a circle in the map below

Actual number of Sikhs in thousands—Census 1931

This circle embraces among other tracts the *Majha* which comprises the Kasur and Chunian Tahsils of Lahore District and the Tarn Taran and Amritsar Tahsils of Amritsar District. The predominantly Sikh tahsils of Garhshankar and Hoshiarpur in the Hoshiarpur District are also included Una and Dasuya Tahsils with a smaller proportion of Sikhs being left out Further south the Rupar sub-division of Ambala and parts of Kaithal sub-division and Thanesar Tahsil of Karnal District fall within it and also nearly the whole of the Patiala State and the major portion of the Sirsa Tahsil of Hissar District. The heart of the circle covers the whole of Ludhiana and Jullundur Districts, the States of Kapurthala, Maler Kotla, Faridkot and Nabha and a considerable portion of the Ferozepore District The figures of the Sikh population are given in the map in thousands for all districts and states. The Sikhs number approximately 2¼ millions within and 1¼ millions outside the circle and their proportion diminishes with the distance from the circle

Variation in Number of Sikhs in Past Censuses.

232 The population of Sikhs has been growing at each census except during the decade 1881—01 and in 1891 was considerably less than half of what it is now The table in the margin shows their number percentage increase and proportion per 10 000 of the total population at each of the past censuses. The numerical strength rose markedly during the decade 1901—11 but the increase dur ing the last decade is unprecedented

Census.	Absolute figures for Sikhs.	Percentage increase	Proportion per 10,000.
1	2	3	4
1881	1,706,909*		822
1891	1,849,371	8 4	809
1901	2,102,813	13 7	863
1911	2,881,495	37·0	1,211
1921	3,107,796	7·8	1,234
1931	4,071,454	31·0	1,479

*Includes figures for Delhi.

Below are given some quotations from the Census Reports of the past, which graphically describe certain phases of the Sikh community bearing on the rise and fall in its population at various periods

The following extracts appear at page 140 of the Punjab Census Report of 1881 —

In 1853 Sir Richard Temple wrote, as Secretary to the Government —

"The Sikh faith and ecclesiastical polity is rapidly going where the Sikh political ascendancy has already gone Of the two elements in the old Khalsa, namely, the followers of Nanak the first prophet, and the followers of Guru Gobind, the second great religious leader, the former will hold their ground, and the latter will lose it The Sikhs of Nanak, a comparatively small body of peaceful habits and old family, will perhaps cling to the faith of their fathers but the Sikhs of Gobind who are of more recent origin, who are more specially styled the Singhs or Lions, and who embraced the faith as being the religion of warfare and conquest, no longer regard the Khalsa now that the prestige has departed from it These men joined in thousands, and they now depart in equal number They rejoin the ranks of Hinduism whence they originally came and they bring up their children as Hindus The sacred tank at Amritsar is less thronged than formerly, and the attendance at the annual festival is diminishing yearly The initiatory ceremony for adult persons is now rarely performed."

In the Administration Report of 1856-57 the same writer says after speaking of the small number of Sikh recruits that offered themselves till the fall of Delhi proclaimed our triumph

"Sikhism itself, too, which had previously fallen off so much, seems again to be slightly on the increase. During the past year the baptismal initiations at the Amritsar temple have been more numerous than during the preceding year Sikhism is not dormant"

And Colonel MacMahon, Commissioner of Amritsar, writes as follows in his Census Report —

"The large decrease in the number of Sikhs since 1868 is not surprising Sikhs decline in number, in years of peace There was a serious decline, I believe, after the conquest of the Punjab down to 1857, when the demand for Sikhs for our army during the mutiny for a time gave a great stimulus to the growth of Sikhism. The idea prevails, not only with the officers of native regiments, but also among the classes from which Sikh converts are obtained, that Sikhs made better soldiers than Punjabi Hindus, and hence whenever the warlike spirit revives, Sikhism in this part of the Punjab also revives All the members of the same family do not always become Sikhs and those who have acquired a taste for the soothing influence of tobacco abstain from taking the *pahul* Hence in times of peace there is a tendency for Sikhism to decline."

The following passage occurs in the Punjab Census Report of 1891 (p 96) —

"There is reason to believe that the marked preference shown for Sikhs in many branches of Government service, the hardy nature of the castes from which they are mainly drawn, and the recent extension of a kind of patriotic antiquarianism among the more educated of them, has not been without its influence in strengthening their power and preventing the disruption of the Sikh community which one has so often seen predicted"

The next decade found the Sikh population rising at the expense of Hindus, and the following remarks are met with in the Punjab Census Report of 1901 (p 122)

"The number of Sikhs in these Provinces,* according to the present returns, is 2,130,987 as against 1,870,481 in 1891, an increase of 260,506, or 13 9 per cent If these figures are at all accurate, Sikhism has made a marked advance since 1891, possibly at the expense of Hinduism, for the Hindus only show an increase of 2 4 per cent"

The phenomenal increase continued even during the very unhealthy decade preceding the census of 1911, when the total population of the Province showed an actual decrease After remarking about the absence of separate vital record for Sikhs, the 1911 Report with regard to the increase in their number said —

"Nevertheless the rate of increase is much too high for the natural development of population, under the unhygienic conditions which prevailed during the decade. The gain seems to have occurred mainly by accretions from the Hindus It has not been possible to ascertain the number of people who have taken the *pahul* during the last ten years, but the Singh Sabhas have been very active in enforcing the tenets of Guru Gobind Singh on all followers of Guru Nanak, whether Sikhs or Hindus, and they have been assisted greatly in their efforts by the fact that only *Keshdhari* Sikhs are enlisted in the army"

In the 1921 Report the following remarks of Mr Garrett, I E S, who acted during a portion of the war period as a Recruiting officer, appear at page 179 —

"My experience during 1917 and 1918 in Ludhiana and the adjacent territories was that there were a large number of families of the Hindu zamindar class of which those members who had enlisted in the Army had as a matter of course, become Sikhs Those who in the ordinary course of events would have stayed at home did not do so When, as a result of the intensive recruiting at the later stages of the War the latter were induced to join up they too became Sikhs"

* The area that now constitutes approximately the whole of the Punjab and N W F Province

Apart from the facts set forth in the extracts quoted above the number of Sikhs since 1911 has greatly risen on account of the changed instructions about the definition of Sikhism. Prior to that year only those were recorded as Sikhs, who according to the tenets of the tenth Guru Gobind Singh grew long hair and abstained from smoking, but since then any one is recorded as a Sikh who returns himself as such whether or not he practises those tenets

The Sect Table XVI A printed in Part III of this Volume gives the numbers of Kesdharis or those who take *pahul* and wear *kes* (long hair) and Sehjdharis or those who do not take *pahul* or grow *kes* These figures are for facility of reference reproduced in the margin for this as well as the last census.

Particulars. 1	Kesdhari. 2	Sehjdhari. 3	Unspecified. 4
1921	2,873,788	228,386	5,145
1931	3,386,529	291,803	909,891
Variation	715,041	63,537	183,750
Variation per cent	24·9	22·4	3,606·9

Sikh Growth due to Absorption of Hindus.

233 It is obvious from the remarks of the Census Reports of the past that the number of Sikhs varies greatly from time to time on account of the comparatively easy conversion from Hinduism. It is not essential for a Sikh to be born a Sikh and any one can be initiated into the religion by *pahul*, a process fully described in the Census Report of 1881 (p 136) This view is borne out by the figures in the margin, which show the absolute increase at each census in the total number of Sikhs as well as the increase or decrease among Hindus

ABSOLUTE INCREASE OR DECREASE.

Year 1	Hindu. 2	Sikh. 3
1931-31	—185,521	+344,324
1911-21	+265,911	+228,891
1901 11	—1,541,462	+776,082
1891-01	+98,341	+219,017
1881-91	+880,886	+172,631

The figures of Sikhs have risen at each census while those of Hindus have shown a decrease at the censuses of 1911 and 1931 At both these censuses the decrease among Hindus was accompanied by a marked increase among Sikhs, though there were also other causes responsible for reduction in the Hindu population such as plague during the decade 1901—11 and the treatment of Ad Dharm as a separate religion on the present occasion. The big rise in the Sikh population during the last decade is obviously not due to natural increase alone If any fresh evidence on this point is needed, we have only to apply the test of survivorship to the Sikh population of 1921 and thus determine approximately the amount of gain due to the absorption of non-Sikh (primarily Hindu) population From the figures in the margin we find that 512,590 persons were so absorbed The calculations are based on the assumption that the proportion of survivors (persons now aged over 10 years) of the 1921 Sikh population would be the same as that for the total population Any excess in the present Sikh population aged over 10 years would therefore, be due to absorption from other communities as Sikhs are not likely to gain in numerical strength through any other cause much less through immigration as among them the number of emigrants is larger than that of immigrants. The estimate of absorption

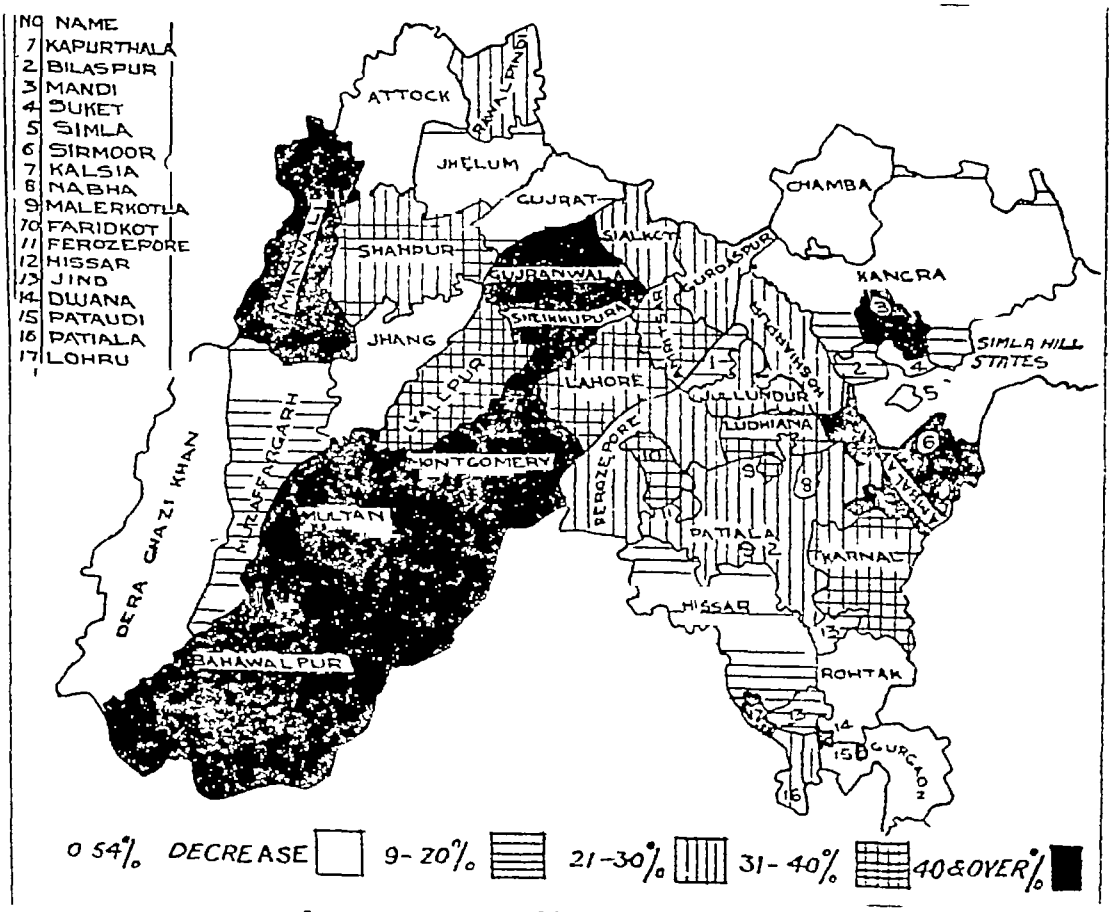

Particulars. 1	All Religions. 2	Sikh. 3
1. Actual population of 1921	*3,101,814	3,107,296
2. Population aged over 10 years of 1931	20,245,375	2,842,466
3. Calculated Sikh population aged over 10 years (Survivors of 19 1)		2,607,584
4. Absorption among Sikhs aged over 10 years		433,878
5. Enumerated Population under 10 years of 1931	8,43,492	1,218,158
6. Calculated Sikh population under 10 years		1,021,449
7. Absorption among Sikhs under 10 years		108,712
Total estimated absorption (by adding items 4 and 7).		542,590

in the population under 10 is made on the assumption that the children under 10 among Sikhs would bear the same ratio to the calculated surviving Sikh population, aged 10 years and over, as the children of all religions under 10 have to the total population aged over 10 years in 1931

In the general remarks in the beginning of this Chapter it has been pointed out how certain castes were being more easily absorbed than others by Sikhism, and having regard to what has been said in this paragraph we can safely foretell that at no distant future most of the Hindu agricultural and artisan classes residing in the areas, included in the circle in the map on page 304 as the stronghold of Sikhs, will go over to Sikhism The only castes of Hindus which stand firm are Brahman and Khatri, though many members of the latter have become Sikhs

Percentage Increase of Sikhs in Smaller Units

234 The map below shows the percentage of increase in the number of Sikhs in each district and state over the figures of the last census

Increase per cent among Sikhs during 1921—31

The high percentage of increase in the canal colonies is undoubtedly due both to inter-district migration and absorption of lower castes of Hinduism while in places like Mianwali, Karnal and Sirmoor, where Sikh population is very meagre, the results are evidently due to mere absorption In such places the percentage of increase does not truly represent any real increase This applies even with greater force to places like Pataudi, Dujana and Loharu In Ambala, Ludhiana, Amritsar, Lahore and Jullundur the increase is entirely due to accretions from other castes as well as to the large natural increase In the Mandi State the increase has resulted from migration owing to the numerous labourers attracted by the Hydro-Electric project at Jogindarnagar In certain districts Sikhs have actually decreased but there is nothing surprising about this

as in districts such as Dera Ghazi Khan, Attock, Jhang, Rohtak and Gurgaon and Simla Hill States Sikhs are very few and the reduction in their number might be due to any cause, migration or absorption by Hindusm. It is on the whole noticeable from the map that Sikhs have in many areas increased at a much greater rate than the total population. The marginal table compares the increase per cent. among Sikhs with that among all religions in British districts.

District.	Increase (+) or Decrease (−) per cent. during the decade, 1921-31.	
	All Religions.	Sikhs.
1	2	3
Hissar	+10·1	+20·9
Rohtak	+4·3	−1·0
Gurgaon	+9·6	−18·9
Karnal	+5·7	+9·7
Ambala	+9·0	+39·4
Simla	−19·8	−30·7
Kangra	+4·6	+18·0
Hoshiarpur	+11·3	+30·2
Jullundur	+14·7	+31·1
Ludhiana	+19·8	+33·1
Ferozepore	+5·3	+19·2
Lahore	+22·0	+29·7
Amritsar	+20·2	+29·4

To give some further idea about the gain of Sikhism I quote in the margin the figures of certain castes for 1921 and 1931. It may be pointed out that these figures furnish no more than a mere indication as except in the case of higher castes such as Jat and Rajput, converts to Sikhism do not as a rule return any caste, being content with the entry of Sikh in the column of caste. This desire to return no caste is actuated by the feeling that it is better not to return a low caste, and as a matter of fact many members of low castes such as Chuhra and Chamar adopt Sikhism in order to escape the *inferiority complex*. In regard to Sikhs the instructions to enumerators were that they should not be pressed to return their caste

Statement showing the increase or decrease among certain Sikh castes.

Caste.	1931.	1921.	Increase (+) or decrease (−).	Percentage of variation.
1	2	3	4	5
Arora	114,329	121,096	−6,767	−5·6
Chamar	188,782	192,590	−3,837	−2·0
Chuhra	189,347	43,478	+145,771	+335·3
Jat	2,124,596	1,823,456	+311,140	+17·1
Rajput	82,829	30,808	+52,021	+73·2
Sunl	96,622	73,777	+22,911	+31·2
Tarkhan	158,103	139,768	+18,335	+13·8

The figures of variation in the numerical strength of castes can be best studied over a long period, as owing to wrong classification or different interpretation of instructions the results of two successive censuses may not serve as an index to actual facts. The table below shows for each of the last six censuses the variations in the population figures of certain castes, which claim both Hindus and Sikhs among their members.

Caste and religion.		1881	1891.	1901.	1911.	1921.	1931.
1		2	3	4	5	6	7
Jat	(Hindu)	1,448,374	1,687,177	1,829,874	1,900,865	1,044,306	991,308
	(Sikh)	1,122,672	1,116 417	1,284,977	1,617,522	1,822,491	2,133,182
Tarkhan (Carpenter)	(Hindu)	13,079	218,941	222,974	182,905	141,833	148,777
	(Sikh)	113,067	134,130	143,904	150 447	139,217	158,416
Lohar (Blacksmith)	(Hindu)	101,195	140,334	110,816	8,294	83,353	74,643
	(Sikh)	21,261	22,247	20,453	24,962	29,625	16,490
Chuhra (Scavenger)	(Hindu)	612,134	8,9,871	921,832	777,121	692,195	504,251
	(Sikh)	40,991	91,321	21,873	49,807	60,345	161,341
Darzi (Tailor)	(Hindu)	9,971	10,318	8,640	7,457	6,178	9,823
	(Sikh)	196	699	738	1,404	1,847	2,620
Chamar (Shoemaker)	(Hindu)	831,815	1,029,525	1,049,092	979 498	908,899	684,963
	(Sikh)	100 911	106,328	73,723	164,170	181,932	153,717

The figures bear out the remarks recorded above. Among Jats the number of Hindus has gone on decreasing since 1901 except for a small

increase in 1921 The Sikh Jats have on the other hand been ever on the increase Among occupational castes such as Tarkhan and Lohar, Hindus have been decreasing since 1901 while the number of Sikhs has been rapidly growing, though of late it has had a downward tendency This is merely due to the failure on the part of Sikh artisans to return any caste at all or to claim Ramgarhia as their caste instead of the traditional caste Tarkhan Many of these artisans were evidently absorbed from Hinduism The number of Chuhras among Hindus has been declining seriously since the 1911 census, and it has been on the increase among Sikhs except in 1901 and 1921 the increase at this census being very much greater than before But for the new Ad-Dharmi movement many more Chamars and Chuhras would have returned themselves as Sikhs

Strength of Sikh Sects

235 The statement in the margin shows the numerical strength of the different sects returned in the Province under the two main divisions "Kesdhari" and 'Sehjdhari The bulk of Sikh population *i e* 88 1 per cent of the total is Kesdhari only 6 9 per cent being Sehjdhari The districts with the largest number of the latter are Hoshiarpur (35 916), Montgomery (31,530), and Jullundur (27,805) The remaining 5 per cent of the Sikh population is made up of "sects analogous to other religions or 'miscellaneous sects' such as Guru Bhag Singh (724) Nirmala (268), Nam Dev (267), Narankari (282), Baba Budhi (231) Kabir Panthi (114), Bedi Sodhi (76), Baba Kalu (52), Sadu (44) Baba Bindu (41) and Gulab Dasi (2) Among Kesdharis the Tat-Khalsas, Hazuris and Nanak Panthis occupy a prominent position For a description of the different sects or their practices or tenets distinguishing them from each other the reader is referred to the Census Reports of 1891 and 1911, in which the subject has been fully discussed The only noticeable feature brought out by the present census is that the strength of minor sects is very much on the decrease owing to a general tendency of modern times to do away with subsects in the interests of the community as a whole.

Sect	Kesdhari	Sehjdhari
1	2	3
Gobind Singh	23,073	
Hazuri	192,886	2 337
Kuka Namdhari	13,008

Udasi	16	369
Miscellaneous	6,059	7
Unspecified	3,280 317	274 440
Total	3 588 829	281 903

Variation in Sects

The variation since 1921 in sects with the greatest number of followers is given in the marginal table Kesdharis have increased from 2,873,788 to 3,588,829, or by 24 8 per cent and Sehjdharis from 228,366 to 281,903, or by 23 4 per cent The orthodox sects such as "Gobind Singh" and "Hazuri" are on the decrease, but sects like Nanak Panthi and Mazhabi, the latter chiefly returned by Chuhras, Chamars, Sansis and Bawarias, show a large increase The increase in the figures of "Unspecified" is due to the lack of return of sect on the part of persons who were formerly recorded as belonging to a particular sect Sects like Udasi and Panj Piria would see to be losing popularity, as also the sect analogous to Islam, namely Sarwaria

Sect	1921	1931	Variation per cent

SECTION 4.—AD DHARMIS

General.

230. The circumstances leading to the return of Ad Dharmi religion have been described in the general section of this Chapter The figures of Ad Dharmis for certain districts have been given in paragraph 219 above. The absolute figures by districts and states are given in Imperial Table XVI and the figures by tahsils in Provincial Table II both appearing in Part II of this Volume. The Ad Dharmis however do not comprise all the Hindu depressed classes as numerous members of these classes have returned themselves as Hindus and abstained from claiming the new religion. The figures for all the depressed classes of Hindus are not available as at this census some limit had to be placed for reasons of economy on the number of castes to be sorted The figures for the most numerous castes are, however available, and the total strength of depressed classes belonging to these castes inclusive of Ad Dharmis is given in Appendix I at the end of this Chapter The table in the margin gives the figures of Ad Dharmis and the Hindu depressed classes* separately as far as available for each district and state. It is evident from the table that Ad Dharmis in most places form only a fraction of the Hindu depressed classes and except in Jullundur and Hoshiarpur which are their strongholds, and Sheikhupura and Lyallpur colonies, Ad Dharmis nowhere outnumber the other depressed lasses. In Montgomery the number of the two is about equal It is obvious, therefore that the number of persons who returned themselves as Ad Dharmis in each area was governed by the peculiar circumstances of the locality In areas like Hissar Rohtak and Karnal where depressed classes are found in large numbers the propaganda on behalf of Ad Dharmis appears to have been ineffective as these districts are far removed from the centre of Ad Dharmi movement. Moreover the Hindu land-owning classes of these tracts wield a strong influence against religious disruption. The number of Ad Dharmis on the other hand is large in the colony districts, wh re menial classes are fully alive to their interests. A lot of propaganda work was done by the leaders of Ad Dharmis specially in the Lyallpur District. At the same time the Sikh land-owners in some districts particularly Lyallpur Ludhiana and Ambala used all their resource to make Chuhras and Chamars return themselves as Sikhs and not as Ad Dharmis and but for this the number of Ad Dharmis in those distri ts would have been considerably larger

District or State.	Ad-Dharmi.	Hindu Depressed Classes.	District or State.	Ad-Dharmi.	Hindu Depressed Classes.
1	2	3	1	2	3

Mianwali		573	Dahanwalpur State	4 417	25,477

* Re ers, Chamar Chuhra, Jin; and K li, Dumna, Megh, Od, Ramdasia, Sansi and Sanva.

In the margin are given figures since 1881 for some of the most numerous depressed classes, who have been returned as belonging to more than one religion The Bawarias at the present moment are equally divided between Hindus and Sikhs, while most of the Sansis returned their religion as Sansi but were thrown into the Hindu religion at the time of sorting The proportion of Chamars in the Ad-Dharmi figures is very much greater than that of Chuhras The fickleness of both in the matter of faith is, however, well illustrated by their oscillation between Hinduism and Sikhism at different censuses A considerable number of Ramdasias, who would have otherwise returned themselves as Sikhs, returned themselves as Ad-Dharmis at this census A further discussion on the subject of depressed classes will be found in Appendix III at the end of this volume

SECTION 5.—MUSLIMS.

General.

237 The Muslims according to the present census number 13,332,460 (7,241,612 males and 6,090,848 females) in British Territory, as against 11,444,321 (6,195,738 males and 5,248,583 females) in 1921, which means an increase of 16 5 per cent In the Punjab States their number is 1,597,436 (874,771 males and 722,665 females) as against 1,369,062 (751,819 males and 617,243 females) at last census, or an increase of 16 7 per cent The proportion of Muslims in British Territory and Punjab States to the total population is 56 5 per cent and 32 5 per cent, respectively, while in the Province it is 52 per cent The Muslim population has never shown a decrease at any of the past censuses During the last fifty years their proportion in the total population has risen from 48 to 52 per cent indicating that the increase among them has been at a greater rate than that among the rest of the population

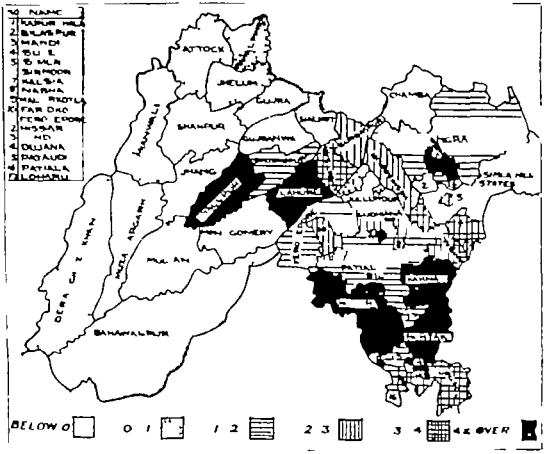

The map below shows the percentage of variation in each district and state since 1921

Increase percentage in Muslim population 1921—1931

The increase is greatest in Montgomery District, but here the total population has also increased by over 40 per cent. The same is the case with Multan and Bahawalpur where the percentage increase is next highest. The increase in Sheikhupura, Lyallpur Lahore and Amritsar has been fairly big. Hissar Ludhiana, Gujranwala, Jhang and Mianwali come next, followed by the north-western districts of Gujrat, Shahpur Jhelum, Rawalpindi and Attock, the south-eastern districts of Gurgaon Rohtak and Karnal, and Ambala and Hoshiarpur There has been only a small increase in Dera Ghazi Khan, Kangra and Bilaspur and the least in Muzaffargarh and the rest of the Himalayan Natural Division.

The map below shows at a glance the difference between the

Excess of percentage increase among Muslims over the percentage increase in the total population 1921—1931

percentages of increase among Muslims and the total population of each district and state In the greater portion of North West Dry Area the rise among Muslims has been smaller than that in the total population This is true of Montgomery Multan Bahawalpur Muzaffargarh Shahpur and Gujranwala. The same applies to the sub-montane districts of Gujrat and Sialkot and the Indo-Gangetic Plain district of Jullundur The slightly greater increase in the extreme western districts, from Rawalpindi to Dera Ghazi Khan is only 1 per cent above the increase in the total population The only other people of this part of the Province are Hindu traders who do not show the same increase as the Muslim gain is in some of these districts no doubt partly due to the demobilization of a considerable number of Muslim soldiers during the last decade The

The figures of total population for 1921 for this map and the map on the last page have been taken from Imperial Table II which gives adjusted figures after accounting for changes in area the figures of Muslims also from Imperial Table VI of 1921 have not been similarly adjusted except in Sheikhupura here alone the transfer of area and population was considerable The population of Montgomery district for 1921 has been estimated to be 704,250 males and 561,431 females.

next higher rise is in Sheikhupura, Ferozepore, Patiala and Jind The increase in the first-named is partly due to the immigration of tenants, field labourers, etc which is still going on from districts such as Jullundur and Sialkot The increase in Lyallpur is due to the recent extension of colonization, and in Lahore to natural causes and immigration to the city The higher percentage increase in south-eastern districts is due to comparatively smaller increase in the rural population which is predominantly Hindu owing to the increasing pressure on resources or unhealthiness The large percentage increase in Mandi is of course mainly due to the influx of labourers at Jogindarnagar

The increase among Muslims has been examined above in more ways than one Two important causes which have apparently contributed to a proportionately greater rise in their population in the past, are the comparative healthiness of the tracts in which the bulk of their population resides, and the great economic development which has taken place in those areas

238 The sects of Muslims have been grouped in Table XVI-A (in Part III of this Volume) under four main heads *viz* (1) Shias (2) Sunnis (3) Reformers and (4) "Sects analogous to other religions" **Muslim Sects.**

The provincial figures are given in the margin for facility of reference It will be seen that over 95 per cent of the Muslim population in the whole Province is Sunni and more than half of the remainder is Shia The group 'Reformers forms only 1 6 per cent of the total, *Ahmadis* and *Ahl-i-Hadis* being 4 and 1 2 per cent, respectively

Sects	Strength	Sects	Strength
1	2	1	2
Shia	338,779	Reformers	241,418
Sunni	14,270,642	Ahl i Quran	440
		Ahmadi	55,908
Hanfi	24,289	Ahl i Hadis	182,544
Miscellaneous	697	Mawahid	896
Qadri	123		
Shafi	1,230	Sects analogous to	
Unspecified	14,250,303	other religions	1,630
		Sects Unspecified	73,057

The figures for the main sects are compared in the margin for the censuses of 1921 and 1931 It is evident that the proportionate increase among Sunnis is about the same as that in the total population The Shias have increased by 32 per cent, while Ahmadis have nearly doubled and Ahl-i-Hadis trebled during the last decade Sects analogous to other religions show an increase but their figure is negligible **Variation.**

Sects	1921	1931	Increase
1	2	3	4
All Sects	*12,813,783*	*14,929,896*	*16 5*
Sunnis	12,406,791	14,270,642	14 5
Shias	256,629	338,779	32 0
Ahl i Hadis	60,327	182,544	202 6
Ahmadi	28,816	55,908	94·0

SECTION 6.—CHRISTIANS.

239 The total number of Christians in the Province is 419,353 as against 332,939 at last census, an increase of 26 per cent Of these, Europeans and allied races number 20,099 or 4 8 per cent, Anglo-Indians 3,625 or 0 9 per cent, and Indian Christians 395,629 or 94 3 per cent Europeans and Anglo-Indians have decreased during the last decade by 8 4 and 19 4 per cent, respectively, while Indian Christians show an increase of 29 per cent, a rate only exceeded by the percentage of rise among Sikhs The causes of variation are discussed in paragraph 315 of the next Chapter on Castes, Tribes and Races **General.**

From Subsidiary Table III at the end of this Chapter it is apparent that Christianity has made great progress since 1881 its followers having increased from 25 000 to over 400 000 or 8 times during the last fifty years. This is mainly attributable to accretions from Muslims and Hindus, mostly from the depressed classes of the latter The table in the margin gives the number of Indian Christians at each of the last six censuses in the Province and the administrative divisions of British Territory The rise in the Lahore and Multan Divisions is particularly great.

Indian Christians

Territory and Division.	1881.	1891.	1901.	1911.	1921.	1931.
1		3	4	5	6	7
Punjab	3,251	18,826	26,854	158,362	204,466	396,629
British Territory	3,26	15,811	26,5 1	157,667	203,128	392,111
Ambala Division	998	850	2,745	7,715	13,210	12,628
Jullundur Division	523	774	1,819	6,220	13,951	15,010
Lahore Division	1,432	16,377	22 023	105,513	127,189	273,949
Rawalpindi Division	130	404	903	18,067	16,711	18,922
Multan Division	79	106	3,941	22,974	37,195	72,186

Of the total number of Indian Christians 45 795 are Roman Catholics and 175 Syrians, while 349 059 belong to the other sects, the detail for which is not available The marginal table compares the present strength of the sects of Indian Christians with that of 1921 It is evident that Roman Catholics have increased by 40 per cent. during the last decade or by a higher rate than the rest of the Indian Christians.

Sects of Indian Christians.	1931.	1921	Percentage variation, 1921—31.
1	2	3	4
Total strength	396,681	295,529	29·7
Roman Catholics	32,007	43,783	40·1
Syrians	24	178	573·1
Others	272,783	348,059	27·7

Local Distribution of Christians.

240 The figures in the margin show the numerical strength of Christians of all races in the Natural Divisions They are most numerous in the Indo-Gangetic Plain West chiefly in Sheikhupura, Gujranwala and Lahore where their proportion has risen during the last decade from 4 48 to 7·07 4 38 to 6 1 and 4 11 to 4 74 per cent., respectively In the two first named districts they have increased at a much greater rate than the total population and the smaller proportion in Lahore is probably due to the fact that the capital of the Province has a great attraction for the other communities as well.

Natural Division.	Total Christians (1931).
1	
Indo-Gangetic Plain West	199,761
Himalayan	2,866
Sub-Himalayan	122,930
North-West Dry Area	86,126

Next in importance is the Sub-Himalayan Division which has 31 6 per cent of the total Christian population. Among the districts of this Division Gurdaspur has registered the greatest increase the proportion of Christians in the population being now 4 45 per cent. as against 3 80 per cent. at last census. The increase in Gujrat (from 2 373 to 3 09) and Sialkot (from 62,266 to 66,363) is small, and in the latter district conversions seem to have reached their utmost limit

One-fifth of the total Christian population resides in the North West Dry Area The district which contain a fairly large number of Christians are Lyallpur Shahpur and Montgomery The numerical strength of Christians in these districts is 4 000 11 000 and 17 000 respectively a again t 4 000 11 000 and 10,000 in 1921 In Shahpur th number of Christians is stationary whil in Montgomery the rise is 70 per cent mainly owing to the colonization during the last decade

Proportionately the greatest number of Christians is found in the Simla District, the summer headquarters of the Government of India, where some Military offices are permanently located The smallest number of Christians as at last census is found in Dera Ghazi Khan, while in the States of Loharu, Dujana, Bilaspur, Patiala and Suket the proportion of Christians varies between 1 and 6 per 10,000 of the total population, and in Jubbal State as in 1921 no Christian has been returned

SECTION 7—MINOR RELIGIONS.

Jains

241 There are now 43,140 Jains in the Province as against 41,321 in 1921, an increase of 4 4 per cent Jainism is treated as a separate religion for the purposes of census, but it is in reality a sect of Hindus, as evidenced by the fact that many Jains return themselves as Jain-Hindus and many Hindus as Hindu-Jains The enumerators were instructed at this census to add in column 4 of the general schedule (religion and sect) the term "Hindu" in brackets after the name of the religion in case a Jain definitely asked that it should be so added The statistics show that 7,626 persons (4,035 males and 3,588 females) returned themselves as Jain-Hindus and were included among Jains, while 526 persons (305 males and 221 females) returned themselves as Hindu-Jains and were included among Hindus

Nearly half the total number of Jains in the Punjab are to be found in the districts of the Ambala Division, chiefly in Hissar, Rohtak and Karnal Jains constitute 14 per cent of the total population of British Territory as against 16 per cent in 1921 The decrease is due to the fact that the figures of Jains and Hindus are liable to intermingle The main caste of Jains is Aggarwal, which in British Territory numbers 19,393 as against 21,746 in 1921, a decrease of 10 9 per cent due to such intermingling

About 21 per cent of Jains belong to Digambar sect and 20 per cent to Swetambar, while the remaining 59 per cent have returned no sect at all At last census these percentages were Digambars 44, Swetambars 53 and "Unspecified" 3 There is thus a very big increase among the "unspecified" The important sub-sect, Sathankwasi, of Swetambari sect has been returned by 3,292 persons (1,752 males and 1,510 females) in the whole Province For fuller details of Jain sects reference may be made to Table XVI-A , in Part III of this Volume

Buddhists

242 Of 7,753 Buddhists enumerated at this census, 5,663 were returned from the Kangra District, 1,301 from Bashahr State and 568 from Chamba State The rest are distributed in the districts and states noted in the margin

Ambala	6	Shahpur	1
Simla	14	Rawalpindi	9
Ludhiana	5	Attock	1
Ferozepore	1	Montgomery	2
Lahore	14	Bhagat	7
Gurdaspur	2	Mandi	138
Gujranwala	1	Suket	14
Gujrat	4	Patiala	2

There were 5,912 Buddhists in the Province in 1921, and the increase during the last decade amounts to 1,841 or 31 1 per cent The figures of Buddhists are apt to intermingle with those of Hindus

Zoroastrians

243 The number of Zoroastrians (Parsis) according to the recent census is 569, as against 598 in 1921 They are generally immigrants from Bombay and their principal occupation is trade The districts and states in which their strength is more than 10 are noted in the margin

Jullundur	70	Rawalpindi	65
Ferozepore	24	Jhang	20
Lahore	159	Multan	117
Amritsar	42	Bahawalpur	20

Jews.

244 The number of Jews in the Province is insignificant being 13 as against 19 at last census and very few of them are domiciled Indians. They have been enumerated in Ambala (2) Lahore (1) Amritsar (4) Rawalpindi (5) and Mandi (1)

Indefinite Beliefs.

245 There is no entry in the tables about agnostics or about those of uncertain or indefinite beliefs. At last census their number was 15 The census agency of enumerators and slip-copyists was not completely free from over zeal and the entries must have been thrown among one religion or other As most of the persons (if any) returning such religions are usually Europeans, they have probably been classified as Christians. One of the instruction to copyists, which might have helped to bring about this result, was that in the case of doubtful entries in respect of any individual similar entries in respect of the other members of the same family should be consulted

SUBSIDIARY TABLE I.

General Distribution of the Population by Religion at each of the last six censuses with variation per cent

Religion and Locality	Actual number in 1931.	Proportion per 10,000 of population in						Variation per cent. Increase (+), Decrease (−).					Percentage of net variation.

Rajput. Parashiya. 303. Sahni. 304 Sansi. 305. Sarera. 306 Sayad. 307. Shaikh. 308. Sunar. 309. Tank Kshatriya. 310 Tarkhan. 311 Teli. 312. Ex Caste entry 313. Representation of castes in services. 314. Strength and distribution. 315. Comparison with the past returns.

Reference to Statistics. The statistics relating to Race, Tribe and Caste will be found in five Imperial and two Provincial Tables. The chief of these is Table XVII, which shows by sex and religion the number in each of the 53 selected castes for each district and state of the Province, the other tables being as mentioned below

Table XI gives the occupation of selected castes, tribes or races for four main divisions of the Punjab separated namely the eastern Punjab, central Punjab hills, central Punjab plains and western Punjab.

Table XIV gives the literacy by selected castes, for the same local divisions as Imperial Table XI. The table distinguishes Hindus, Muslims and Sikhs, etc in each caste in which there are many representatives of each religion.

Table VIII gives the data, for certain selected castes, of civil condition by age groups and religion.

Table XVIII gives the comparative strength of each of the selected castes for each census since 1881 together with the intercensal variation.

Table XIX gives the age-grouping of European and allied races and Anglo-Indians. Provincial Tables VIII A and XIV-A give, respectively the strength and statistics for literacy by castes of certain sects, viz., Vedic Dharm, Dev Samaj and Brahmo Samaj.

Proportional figures are given in the Subsidiary Tables described below :—

Subsidiary Table I gives, for selected castes classified according to their traditional occupations, the strength (in thousands) and proportion per mille of the population of the Province.

Subsidiary Table II gives the comparative absolute strength (in thousands) of the selected castes in each of the last six censuses with percentage variation at each census. This table is based on Imperial Table XVIII.

General. 246 The instructions to enumerators in respect of the entry about caste tribe and race were —

(Column 6—Caste)—For Hindus, Muslims, Jains, Sikhs, Aryas, Brahmos and aboriginal tribes enter the caste or tribe but for wide castes enter sub-sections also. The main tribes, Brahman, Kshatriya, Vaishya and Sudra, are usually unreflected by themselves. For Christians, Parsis and foreigners enter race as Anglo-Indian, Canadian, Goanese Turkish. For Indians, such as some Christians, who have neither caste nor tribe enter Indian.

These instructions were amplified by the following provisions in the Code —

(Column 6). The caste should be entered in case of Hindus, and in the case of Jains and Sikhs if stated, e.g. Brahman, Khatri, Arora, J t, Rajput, etc. No faith should be pressed to name the caste to which he belongs if he does not wish t do so In such cases the word Sikh should be entered in this column. In the case of Muslims the tribe should be noted thus— Sayad, Pathan, Baloch, J t, Rajput, etc. The nationality should be noted in case of Christians, Parsis, etc., e.g., British, French, Portuguese Goanese Punjabi, Bengali, etc.

There is indeed a great variety of castes, tribes and races in this Province though not quite on the same scale as in some other provinces. These figures have always been tabulated at past censuses subject to certain limitations. For instance the castes returned by Indian Christians were never tabulated, though if tabulated they would have explained some of the variations met with from census to census, among the castes of other religions. On the present occasion after the recording of castes had been completed orders were received to cut down certain Tables, and in the case of castes and tribes to dispense with the sorting and tabulation of those more or less unimportant The castes or tribes that have now been tabulated fall under the following categories —

(*a*) All the castes or tribes, whose numerical strength was at least four *per mille* of the 1921 population.

(*b*) The four criminal tribes, viz., Sansi, Bawaria Harni and Lakhraras

(*c*) Castes which could be called depressed

(*d*) Such non Hindu zed primitive tribes as did not fall under categories (*a*) to (*c*).

(*e*) Others of an all India importance

The castes included in category (*c*) either under instructions from or with the approval of the Census Commissioner for India were Darzi Meo, Tank Kshatriya and Dhiman Brahman. Of th two last named castes Dhiman

Brahman was returned for the first time by Lohars and Tarkhans and Tank Kshatriya by Darzis, Dhobis, etc Meo is a tribe of Gurgaon District, and its figures were sorted in order to ascertain the results of the uplift work done during the last decade The figures have also been compiled for Brahmanic Hindus who refused to return any caste

The list of the selected castes belonging to each category is given below —

(*a*)	1	Aggarwal	14	Ghirath	27	Mochi	
	2	Ahir	15	Gujjar	28	Mussalli	
	3	Arain	16	Jat	29	Nai	
	4	Arora	17	Jhiwar	30	Pathan	
	5	Awan	18	Julaha	31	Qasab	
	6	Biloch	19	Kamboh (Kamboj)	32	Rajput (Kanet, Rajput, Rathi)	
	7	Brahman	20	Kashmiri			
	8	Chamar	21	Khatri			
	9	Chhimba	22	Kumhar	33	Saini	
	10	Chuhra	23	Lohar	34	Sayad	
	11	Dagi and Koli	24	Machhi	35	Sheikh	
	12	Dhobi	25	Mali	36	Sunar	
	13	Faqir	26	Mirasi	37	Tarkhan	38 Teli
(*b*)	39	Bawaria	40	Harni	41	Pakhiwara	42 Sansi
*(*c*)	43	Bagaria	44	Dumna	45	Ghosi	46 Kahar 47 Mahtam.
	48	Megh.	49	Od	50	Ramdasi	51 Sarera
(*d*)	Nil						
(*e*)	52	Darzi	53	Meo	54	Tank Kshatriya	55 Dhiman Brahman 56 Caste Nil (among Brahmanic Hindus)

Classification of Castes

247 The reduction in the number of castes, however, did not reduce the usual worries connected with their classification, as all the slips with doubtful entries had to be carefully examined before they could be included in or excluded from the selected castes A passage which sums up this class of difficulties is quoted below from the Census Report of 1891, and time has by no means brought about any mitigation of the difficulties

"No one who has not gone into it himself has any idea of the extraordinary difficulty attending the whole subject The caste and sub-caste are of course returned correctly in a vast majority of cases, but this still leaves room for an immense number of vagaries, which causes the whole difficulty of tabulation Not only is the sub-caste returned in place of the caste, but the sub caste may be returned without any indication of a caste, or the name returned as a caste may be the name of an occupation, or caste names may appear both as caste and sub caste or no caste or sub-caste at all may be returned or in fact every kind of confusion must be expected. And the orders on the classification must, as a rule, be given without delay, a reference to the original schedules or an enquiry from the local authorities being a luxury in which one can only occasionally indulge without greatly impeding the work The individual undergoing enumeration often mis pronounces his caste-name, the enumerator often mis spells it, even when properly pronounced the abstractor may transcribe the enumerator's spelling after a fashion of his own, and the clerk who prepares the caste list may have further improved on the abstractor All this is however, of course inevitable it must be accepted as part of the risks in a large enterprise like this And yet there are pitfalls not a few, as will be seen plenty of times in this chapter A Bedi for instance (with a soft d) is a man of a saintly family, while a Bedi (with a hard d) is a thing of naught, whom we have to class with the Kanjars"

The Nature and Evolution of the Institution of Caste.

This is not all There are numerous difficulties arising from other important factors In the 1881 Report, paragraph 340, page 176, Sir Denzil Ibbetson remarked —

"Thus we see that in India, as in all countries, society is arranged in strata which are based upon differences of social or political importance or of occupation But here the classification is hereditary rather than individual to the persons included under it, and an artificial standard is added which is peculiar to caste and which must be conformed with on pain of loss of position, while the rules which forbid social intercourse between castes of different rank render it infinitely difficult to rise in the scale So too the classification being hereditary, it is next to impossible for the individual himself to rise it is the tribe or section of the tribe that alone can improve its position and this it can do only after the lapse of several generations, during which time it must abandon a lower for a higher occupation, conform more strictly with the arbitrary rules affect social exclusiveness or special sanctity or separate itself after some similar fashion from the body of the caste to which it belongs The whole theory of society is that occupation and caste are hereditary, and the presumption that caste passes unchanged to the descendants is exceedingly strong But the presumption is one which can be

*It goes without saying that some of the depressed classes fall in category (*a*) all the castes included under this head are of course not untouchable but merely socially or educationally backward The castes eventually treated as depressed in the sense of being untouchable are discussed in Appendix III at the end of this Report, and besides many Hindu castes include all Ad Dharmis Their figures appear in Appendix I to Chapter XI in addition to being illustrated by the Social Map

defeated, and has already been and is now in process of being defeated in numberless instances. As in all other countries and among all other nations, the gradations of the social scale are fixed but society is not solid but liquid, and portions of it are continually rising and sinking and changing their position as measured by that scale; and the only real difference between Indian society and that of other countries in this respect is, that the liquid is much more viscous, the friction and inertia to be overcome infinitely greater, and the movements therefore far slower and more difficult in the former than in the latter. This friction and inertia are largely due to the set of artificial rules which have been grafted on to the social projection common to all communities by the peculiar form which caste has taken in the Brahmanical teachings. But there is every sign that these rules are gradually relaxing. Sikhism did much to weaken them in the centre of the Punjab, while they can now hardly be said to exist on the purely Mohammadan frontier and I think that we shall see still more rapid changes under the indigenous rule now rising to bear upon the society of the Province. Our disregard for inherited distinctions must ultimately abate something, and the introduction of rifle promises, to lessen the bonds of caste. It is extraordinary how incessantly in reporting customs in correspondents note that the custom or restriction is fast dying out. The liberty enjoyed by the people of the Western Punjab is extending to their neighbours to the east, and especially the old tribal customs are gradually fading away. There cannot be the slightest doubt that in few generations the materials for study of caste as an institution will be infinitely less complete than they are even now.

The social evolution predicted in the above passage was noticed again and the future anticipated in the 1911 Report in the following remarks on page 409 —

> The modern classes like Khatris and Aryas which are being substituted for the old castes fill probably in course of time become as rigid as any others. The revolt against caste is due mainly to the inconvenience of restrictions of inter-marriage and inter-dining. The object of the modern tendency will, therefore, probably be completion does permission of restrictions of both kinds, while the names of the castes or tribes may be retained in the case of higher castes as traditional distinction, the lower castes grouping themselves in large democratic classes of uniform status. But how long this process will take is very difficult to predict. My general conclusion is that there has been little advance in this Province during the past thirty years with reference to the basis of caste distinctions, but that the restrictions have become very lax, the rules are being disregarded with impunity in respect of inter-marriage and inter-dining, the traditional conceptions are being given up owing to the functional revolution which is in progress, and general reaction has set in whereby members of lower or unskilled castes are trying to rise to the level of the higher ones, either by ascribing themselves with forefather behaving to one of those castes, or by discovering new origin for their tribe or caste.

The remarks in the above quotation about inter marriage apply to a very limited number of cases, while inter-dining has become more widespread. The tendency among lower classes to rise in the social scale is obviously on the increase and in towns particularly it is quite easy for a low caste person to claim a higher caste without any fear of detection.

Castes and Social Precedence.

In 1911 an attempt was made to tabulate the Indian castes on a basis of social precedence. This attempt could not be expected to succeed in view of the fact that nearly all castes consider themselves to be most exclusive and high-born. It however had the effect of producing a competition among certain castes, in a particular stage of social evolution, to have their claims to some actual or mythical origin recognised by census authorities. The nature of these claims made at the censuses of 1911 and 1921 is discussed in the Census Reports of those years on pages 303 and 342 respectively. Many claims were advanced on the present occasion and the more important of them are noticed here. The Punjab Rajah Central Committee represented that Nai was not a caste but a mere occupational term, and on behalf of Nais professing Muslim, Hindu and Sikh religions asked for permission to return their caste as Brahman, Rajput or Jat. A representation was received from an association of Hindu Lohars and Tarkhans, who wanted to return their caste as Dhiman Brahman. The occupational castes, Darn (tailor) Chhipi (calico-printer) Chhimba (washerman) etc put in a claim for being recorded as Tank Kshatriya. An association of Mirasis, known as the Jamat-ul Quraish of the Punjab and the North-West Frontier Province, claimed that Mirasis were in reality Qureshis and should be returned as such. A strong protest was entered by the Nadwat-ul-Quraish a committee representing the Qureshis with headquarters at Amritsar stating that Mirasis were a low class and should not be permitted to return themselves as Qureshi. This on the present occasion more than ever before a tendency was noticed in various localities particularly among occupational castes, to return a higher caste. One of the main reasons was a desire to be included in one of the agricultural tribes, such as Jat or Rajput and thus to secure exemption from the provisions of the Punjab Alienation of Land Act

Option to Return any Caste

248 A real change in instructions made at this census with regard to the entry about caste was the option given to each individual to return whatever caste he pleased Formerly the instructions to enumerators required that if a person of lower caste wanted to return a higher caste his claim should be rejected and only the caste to which he was supposed to belong should be recorded The option given on the present occasion however was supplemented by the instruction that the traditional caste should in all cases be recorded in brackets after the caste claimed The object in securing the figures of traditional castes was two-fold namely to ascertain how many people were anxious to claim a higher caste and to facilitate comparison with the past figures The instruction issued was as follows —

"If any person returns a caste other than his traditional caste it should be recorded in column 8 of the general schedule with the traditional caste being added within brackets such as Brahman (Nai) Dhiman Brahman (Carpenter), Tank Kshatriya (Tailor) Moghal (Carpenter) and Awan (Nilgar)"

In order to utilize the return of dual castes the following instructions were issued during the tabulation of caste returns to the sorting and compilation staff —

TABLE XVII

'All the doubtful entries should be classified by the Deputy Superintendents as required by paragraph 52 of the Census Code In the case of dual castes the entry should be made in the Sorter's Tickets on the following specimen —

Sunar	500
Sunar (*Rajput*)	400
Sunar (*Khatri*)	300
	1,200

The figures are to be shown under the original caste and not under the higher caste claimed at the time of the census"

It will be seen that as a result of these instructions the entries within brackets though also tabulated separately were included in the traditional caste and not in the caste claimed This procedure helped to classify the returns correctly up to a limit, but there was no help for cases in which certain persons mainly those belonging to occupational castes had successfully withheld the traditional caste with the result that only the caste claimed was recorded This happened on an extensive scale in urban areas where the immigrants, particularly the well-to-do and prosperous are little known so far as their castes and antecedents are concerned even to their next door neighbours At the same time a tendency was noticeable for persons of low castes well placed in life, to return no caste and there had been a propaganda in this connection particularly by the *Jat Pat Torak Mandal* (an association designed to do away with the caste system) The instructions issued by me were that 'no caste return' should be recorded in cases in which the person enumerated had a genuine objection to the caste entry having ceased to observe caste in his marital and inter-dining relations All these circumstances have combined to bring about a decrease in the number of certain occupational or lower castes which we shall notice later on The number of persons, who claimed a higher caste but were included in the figures of traditional caste, appears in Appendix II at the end of this Chapter Appendix I shows the details of the occupational castes included in total figures of Tank Kshatriyas and Dhiman Brahmins Wherever the numerical strength of an important caste has increased at a rate in excess of the general rise in population we can safely assume that it is due mainly to accretions from a lower caste the persons concerned having succeeded in returning the higher caste without the addition of the traditional caste As time goes on such efforts multiply but it is certainly worth while to study them

Castes of Females.

249 The following instructions, as in 1921 about the return of castes by women were issued —

"Women—The caste of an unmarried girl will be the same as that of her father. In respect of married women the entry should be as stated by her husband. If enquiries should be made as to the caste or tribe of married women before her marriage. Her present caste or tribe should be asked and the answer taken down without question. Among Hindus the caste of women will be that of her husband. But among Muslims the husband may in some cases like to have one of his wives put down as Pathani, the other as Jatti, and third as Balochan.

Origin of the Caste System

250 The subject of castes, their origin and comparative social status, has been fully discussed in the previous Census Reports of this Province. Sir Denzil Ibbetson's Caste Chapter in the 1881 Report is still regarded as the main authority on the subject, and notable additions to the study of the subject were made by his successor of the 1901 census, Mr Rose, who dealt with the subject from a new point of view No complete study of variation in the number of persons belonging to different castes and tribes observable from census to census is possible except with the help of the explanations given in the various Census Reports. At this census we have prepared Table XVIII which compares the strength of the castes and tribes, for which figures were available on the present occasion, with the corresponding figures of all the past censuses. This Table appears in Part II of this Volume and the figures therein are given as far as possible for the localities where any considerable number of persons belonging to a caste or tribe reside. The variation from census to census as well as the net variation from 1891 to the present census has been given by religion and wherever possible by sex. For the purposes of this Table the Punjab has been split up into four main divisions described below —

A.—Eastern Punjab, including the Ambala Division except Simla District and the States of Loharu, Dujana, Pataudi, Kalsia and Nirmoor.

B.—Central Punjab, Hills, including the Simla and Kangra Districts, the Simla Hill States and the States of Bilaspur Mandi, Suket and Chamba.

C.—Central Punjab, Plains, including the Jullundur Division except Kangra District, Lahore Division, the Gujrat, Lyallpur and Jhang Districts, the Phulkian States, and the States of Kapurthala, Faridkot and Maler Kotla.

D.—Western Punjab, including the remaining districts in the Rawalpindi and Multan Divisions and the State of Bahawalpur

A reference will frequently be made to these Divisions as we examine the strength of castes, tribes and races in subsequent paragraphs. A subsidiary table similar to Table XVIII showing the total strength and percentage variation in each caste is printed for facility of reference at the end of this Chapter The facts and figures, discussed in this Chapter should furnish valuable information about the modern tendencies of the caste system. Into the subject of the origin of the caste system or an explanation as to the comparative social status of the various castes I need not enter Ample material is available on the subject of the origin of caste system in Sir Denzil Ibbetson's Census Report and Sir Herbert Risley's 1901 India Report as well as in books such as Emile Senart's Caste System." Regarding the comparative social status of castes Sir Denzil Ibbetson's Castes of the Punjab and Mr Rose's Glossary of the Tribes and Castes of the Punjab" contain a wealth of detail never again collected I shall, therefore confine myself to an explanation of the 1931 returns and their significance It may be useful to mention that the present figures of castes have been compiled with the aid of an index supplemented at past censuses, which has helped considerably to classify doubtful entries on old lines Figures returned under synonymous names have as usual been grouped together *e.g.*, the figures for the caste *Chuhra* include those for *Bhangi Khakrob, Mehtar Halal Khor* etc., which are the different names by which the caste is known in different localities.

Coming to the trading classes we find that Aroras are the most numerous forming — *per mille* of the total population while Khatris come next with a proportion of 18 *per mille* and Sheikhs and Aggarwals have a proportion of 15 and 13 *per mille* respectively

The next most numerous classes are the artisans, prominent among whom are Tarkhans with a proportion of 23 *per mille* and Lohars with a proportion of 12 *per mille* of the total population. The figures for Ramgarhias who are mainly Tarkhans, Lohars and masons and are tending to form a separate group were not sorted on the present occasion. Julahas have a proportion of 24 *per mille* Kashmiris 7 *per mille* Teli 12 *per mille* Machhi 11 *per mille* Jhiwar 10 *per mille* and Chhimbas and Dhobis together 9 *per mille* Of the lower menials, Chamars including Ramdasias constitute 24 *per mille* and Mochi 17 *per mille*, while Chuhras and Mussallis are 24 and 14 *per mille* respectively

The two castes which cater to the rich or the well-to-do, namely Sunar and Qasab number only 7 and 4 *per mille* of the total population. respectively Of the classes who live by services commonly termed *kirt* or *sep* the Nai constitute 17 *per mille* and Mirasi 9 *per mille*

Variation in Caste Figures During Last Decade.

283 The figures quoted above reveal that the social structure of the population is much the same as before in spite of the new influences. Some castes and tribes however show a great variation, particularly in certain localities. The table below shows the percentage variation since 1921 in the number of each caste and tribe tabulated by religion in the Province as a whole In order to explain these variations I propose to take up each caste or tribe in the alphabetical order in which it appears in Imperial Table XVII

Percentage variation (+ reduced) castes by Religion based on Imperial Tables XVII 1931 and XIII 1921.

Caste.	All Religions	Hindu.	Sikh.	Muslim.	Caste.	All Religions	Hindu.	Sikh.	Muslim.
1	2	3	4	5	1	2	3	4	5

Hindu + Jain.

Aggarwal

254 The Aggarwals among Hindus number 352,999 and among Jains 24,341 The former have increased by 27,808 or by 9 per cent, while the latter have decreased by 1,508 or by 5 8 per cent, due partly to interchange and partly to Jains omitting in many cases to return a caste The line that divides the Hindu and Jain Aggarwals is extremely vague even vaguer than that which divides Jainism from Hinduism The classification of Aggarwals was full of pitfalls as many had only returned their sub-castes, such as Mittal, while some returned their caste as Bania, which is not a caste but merely an occupational term Among Hindu Aggarwals those engaged in the traditional occupation of trade show a decrease partly explained by an increase among Hindu Aggarwal lawyers and doctors, etc Jain Aggarwals show an increase in the traditional occupations as well as in learned professions

Ahir

255 The Ahirs have shown an all-round and quite legitimate increase, their present strength being 221,933 An unusual feature is met with in the figures for Ambala, where the proportion of females in a total of 1 598 is only 509 Such disparity was also noticeable in 1921 when there were 501 females per 1,000 males Ahir men come out to the Ambala Cantonment for labour and usually do not bring their women folk with them Muslim Ahirs are found only in Shahpur District Hindu Ahirs show an increase in the total population and among field and unclassed labourers, there being a specially large number of workers among them They show a decrease in all other occupations, notably in Public Force due most probably to demobilization, and among those engaged in cattle-breeding The latter circumstance seems to show that Ahirs are giving up cattle-breeding, believed to have been at one time their principal occupation.

Arain.

256 There is a decrease among Hindu Arains, who are very few They are found only in Patiala and Karnal District The increase among Muslim Arains, from 1,088,697 in 1921 to 1,330,057 in 1931, or by 22 per cent, is large and general, the principal increase being 26,036 persons or 20 9 per cent in the Jullundur District (more among women than among men), a circumstance which points to emigration of Arain males to colony areas In Montgomery and Multan Muslim Arains have increased during the last decade from 60,724 to 95,226 and from 43,826 to 67 340, or by 56 8 and 53 7 per cent, respectively, mainly due to the recent colonization of the Nili Bar According to Table XI an increase of 33,980 workers (27,584 males and 5,396 females) or 11 5 per cent is found among Arains in the traditional occupation of agriculture The other prominent increases are as follows —

198 3 per cent among field labourers, who now number 18 459,

68 8 per cent among those engaged in arts and professions, who now number 3,744,

28 5 per cent among those engaged in trade, and

43 8 per cent among owners of means of transport (presumably bullock cart owners)

The Arains can thus rightly claim to be a very enterprising class

Arora.

257 The Hindu Aroras have increased during the last decade by 11 2 per cent and now number 661,268 The increase among males is 33,363 or 10 4 per cent and among females 33,420 or 12 2 per cent This increase does not represent the actual rise in the Arora population as Hindu Aroras are often claimed by Sikhism, and they sometimes omit to return their caste or return it as Arya

The Hindu Aroras have decreased in Gurdaspur Amritsar Jhelum, Attock, Muzaffargarh and Dera Ghazi Khan. In the two last named districts the decline is most probably due to emigration to the Nili Bar as evidenced by the fact that males have decreased by 5·4 and 8·4 per cent. and females by only 1·8 and 5·0 per cent. respectively The biggest percentage increases are shown by Lyallpur (34·1) and Multan (18·7) an indication of the great attractiveness of canal colonies for Aroras. There is an increase in the case of males among workers engaged in the traditional occupation of trade while there is a decrease among females for reasons explained in Chapter VIII paragraph 145 Other notable increases are among those engaged in arts and professions and Public Administration as well as among those who live on their income There is a decrease among cultivators of all kinds, artisans, and officers of the Army The Hindu Aroras engaged in commercial occupations have increased, as many artisans and cultivators among them have gone over to Sikhism or omitted to return the caste, the object in both cases being to get rid of a caste which is not considered very elevated

The Sikh Aroras have decreased during the last decade from 121 096 to 114,329 the decrease being more noticeable among females. The decline is positively due to the return of no caste. For the same reason there is a decrease under most of the occupations.

The Muslim Aroras are only 88 in number as against 230 in 1921 They are known as Khojas or Sheikhs, and so there is nothing surprising about their decrease.

Awan.

258 There is a big increase among Awans, a purely Muslim tribe from 440 130 to 539,242 or 22·5 per cent The figures for Shahpur Jhelum, Rawalpindi Attock and Mianwali, where the tribe is most numerous, are given in the margin for the last six censuses. Other notable increases are of 3 889 or 84·8 per cent. in Lyallpur of 3,293 or 140 per cent. in Montgomery and of 5·705 or 179·2 per cent in Multan. In the figure of increase for Lyallpur females are in the majority a fact which points to permanent settlement of Awans in this old colony

District	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Jullundur	9,420	10,791	12,250	10,686	11,306	15,719
Sialkot	18,753	22,620	24,300	19,744	20 412	22,627
Shahpur	48,483	52,602	53,287	65,825	72,041	81,329
Jhelum	93,826	97,583	99,84	51,836	49,103	61,221
Rawalpindi	151,834	159,612	149,625	30,931	40,830	48,627
Attock	Not Available			165,831	169 791	204,253
Mianwali	Not Available			23,417	20,435	18,069	27 467

According to Table XI the main increase is to be found among persons whose traditional occupation is agriculture there being 19 530 more male and 6,810 more female workers than in 1921 There is a decrease of 1 001 in Public Force The loss under this head due to demobilization might have been much larger but it appears to have been partly made up by the increase in Police Service etc. There is an increase of 1 663 under Liberal Arts and a decrease of 314 under Public Administration. The proportion of literates per *mille* is 28 as compared to 20 in 1921 Awan is a leading and influential caste in the north west of the Province and gains by accretions from other castes, particularly occupational.

259 The Bagaria has been shown as a separate caste since 1911 It is returned chiefly from Ferozepore (8,467), Bahawalpur (5,971) and Hissar (4,061), the total number in the Province amounting to 32,527 Bagarias are immigrants from Bagar or the country lying to the south of Loharu, Hissar and Ferozepore, and are chiefly labourers engaged in earth-work on canals or buildings Bagaria.

260 Of the 32,527 Bawarias, enumerated in the Punjab at this census, practically all are either Hindus or Sikhs, the number being almost equally divided between the two communities At last census there were 26,000 Hindu Bawarias and only 9,000 Sikh Bawarias There is a decrease among Bawarias which is particularly noticeable in Ludhiana and Ferozepore, mainly due to the fact that at this census Bawarias have in large numbers returned themselves as Sikhs without stating their caste This view is corroborated by occupational figures (in Table XI) which show a decrease among cultivators, field-labourers and cattle-breeders, public force (village *chaukidars* mostly), learned professions and those living on their income, as only the well-to-do among Bawarias would care to return no caste Bawaria.

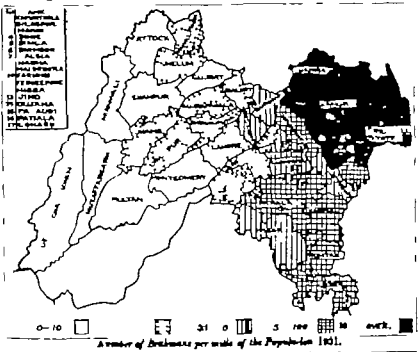

261 The Biloches have increased from 531,381 to 624,695 or by 17 6 per cent The figures for the districts and states having the largest number together with the percentage increase are given in the margin The increase among the Biloches is usually greater than the total increase among Muslims The increase in Dera Ghazi Khan and Muzaffargarh, the home districts of the tribe, is much higher than in the total population of these districts and may be due partly to a claim of Biloch status by some members of certain other tribes The Biloch is a most respectable tribe in Dera Ghazi Khan, but is anything but respectable in Karnal while in all the other districts most of the Muslim camel-drivers, whatever their original caste may be, are almost invariably designated as Biloch Biloch

District or State	Total strength in 1931	Variation per cent 1921—1931
1	2	3
Dera Ghazi Khan	223,592	11 1
Muzaffargarh	121,300	11 9
Bahawalpur	87,768	20 4
Multan	43,068	40 8
Montgomery	32,095	48 3
Lyallpur	20,070	35·0
Jhang	24,498	20 7
Shahpur	19 241	18 3
Mianwali	18,245	16 6

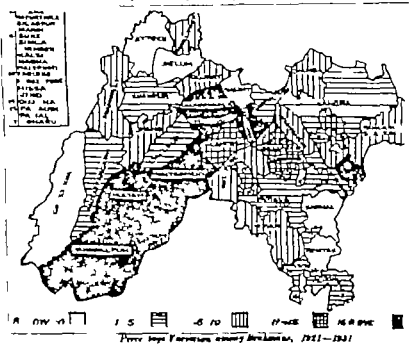

Turning to the occupations we find that there is an increase of 9,153 male and 1 566 female workers in the traditional occupation of camel-driving There is also an increase of 5 434 or 5 2 per cent in agriculture of all kinds and of 2 898 or 39 per cent among breeders of animals Artisans show a decrease of 1,056 or 20 2 per cent, trade of 421 or 48 9 per cent [illegible] in Public Administration of 29 or 181 3 per cent and Learned Professions of 688 or 68 3 per cent Very few Biloch women seem to work there being 45 female workers per 1 000 male workers as compared with 165 per 1,000 for the total workers of the Province according to Table X

Brahmans.

62. The total number of Brahmans in the Province is 581 045 males and 477 333 females, the intercensal increase among them being 3·8 and 0·5 per cent respectively as compared with a decrease of 2·3 per cent in the total Hindu population. The difficulties of classification are particularly great as among Brahmans there are thousands of sub-castes and *gots* which are returned as castes. The map in the margin shows the proportion of Brahmans in the total population in each district and state. The Himalayan Natural Division and the south-eastern districts having a preponderance of Hindu population are the home of Brahmans. Their strength in the central districts is not inconsiderable but is very small in the predominantly Muslim districts in the north and south west. The map in the margin shows the increase per cent. in the strength of Brahmans in each district and state during the last decade. The rise per cent is highest in colony districts and Sirmoor State though the intrinsic figures are small. The only increase which seems erroneous, is to be found among Brahmans in Jullundur amounting to 4 676, or 4·0 per cent a percentage several times higher than that for Brahmans in Kangra District which is one of their strongholds. There is a decrease in the number of Brahmans in Hoshiarpur, Karnal, Simla, Jhelum, Attock and Dera Ghazi Khan. Brahman females have increased in Lyallpur by 738 or 17·6 per cent apparently due to the permanent nature of immigration

Number of Brahmans per mille of the Population 1931.

Decennial variation among Brahmans, 1921—1931

There is a decrease of 14,997 males and 7,174 females under the traditional occupation of priesthood which still claims 118 *per mille* of Brahman workers, indicating that priesthood now provides livelihood on a restricted scale. The number engaged in agriculture which gives employment to 321 *per mille* of total Brahman workers is now less by 18·6 per cent. There is an increase of 1,068 or 13·8 per cent among artisans which may be due to the inclusion (of course contrary to instructions) of some of the Dhiman or Jangda Brahmans, usually carpenters a number of whom might have succeeded in returning themselves as Brahmans pure and simple as in 1911.* The instructions were to record both Dhiman Brahman and Jangda Brahman as distinct castes, though the latter was not eventually tabulated.

The Hindu Brahmans show a large increase in trade, there being now 39,343 workers as against 32,691 in 1921 an increase of 20·7 per cent. The increase under Arts and Professions amounts to 1,921 or 71·8 per cent, and the number of persons living on their income has also risen by 265 or 13·7 per cent. There is a decrease in Public Force and among beggars.

Chamars including Ramdasias and Hindu Mochis

263. The Chamars and Ramdasias have been shown separately in Table XVII, but had better be discussed here together. Ramdasias have been excluded from Table VIII (Civil Condition by Age for Selected Castes) XI (Occupation of Selected Castes Tribes or Races) XIV (Literacy by Selected Castes Tribes or Races) and XVIII (Variation of Population of Selected Tribes) but it will certainly be an advantage to include them in those tables at the next census. Chamars and Ramdasias taken together number 1,236,911 or 8 per cent more than in 1921. The distribution of Chamars and Mochis between the Hindu and Sikh religions in 1921 and among Hindus, Sikhs and Ad Dharmis in 1931 is given in the margin. The figures of Chamars inclusive of Ramdasias and Mochis for the last six censuses are also reproduced in the margin from Table XVIII. It is evident that there is a large decrease among Hindu Chamars since 1921, mainly due to more than a quarter of a million of them having returned their religion as Ad-Dharmi. At the same time Chamars did not show in the past the same rapid increase as some other tribes. Assuming that Chamars including kindred castes have increased since 1881 at the same rate as the total population of the Province, and there is no reason why they should have not, there would now be 1,689,066 Chamars or 456,414 more than actually returned. The difference indicates the extent to

Locality	1921		1931		
	Hindu	Sikh	Hindu	Sikh	Ad Dharmi
1	2	3	4	5	6
Punjab	949,[illegible]	163,[illegible]	70[illegible]	2,5,833	876,349
British Territory	7[illegible],421	8,[illegible]	470,1[illegible]	125,410	248,431
Punjab States	217,[illegible]	78,[illegible]	23[illegible],027	91,423	7,918

Provinces	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Total Chamar, etc.	1,011,811	1,119,7[illegible]	1,171,218	1,078,841	1,177,988	1,237,552
Hindu	9[illegible],000	1,021,177	1,091,117	912,441	971,686	701,709

*Punjab Census Report, 1911, p. 393.

which Chamars have gone over to Sikhism. Christianity or Vedic Dharm and as such have abstained from returning their caste

The number of Chamars returning Vedic Dharm as their sect is 9,394 as against 1 086 in 1921 Their figures in both cases are included in the total figures for Hindu Chamars, but the indication is that Chamars are anxious to escape from the hold of this caste, which is regarded by the orthodox Hindus to be even lower than Chuhra. The Chamars on conversion to Vedic Dharm generally abstain from returning their caste. The strength of Aryas has risen from 83 488 in 1911 and 199 089 in 1921 to 341,290 in 1931 in no small measure due to accretions from the low castes including Chamar

One curious fact discovered by a comparison of the proportion of literacy among Chamars, according to Table XIV under different religious denomina tions, is illustrated by the marginal table which also gives the figures for Chuhras It is apparent that among Chamars many more literates than illiterates, and among Chuhras a larger proportion of illiterates have returned themselves as Ad Dharmis.

Caste	Religion.	Total population.	Literates per mille aged 7 and over.
1		2	3
Chamar Hindu		644,952	5
	Ad-Dharmi	256,349	13
	Sikh	134,532	14
Chuhra Hindu		363,224	8
	Ad-Dharmi	86,548	5
	Sikh	160,247	9

Chamars. 264 After Chamars it will be appropriate to discuss the figures of the caste Chuhra the Chhimba to be dealt with later on.

Chuhra. 263 The Chuhras are a class, which has shown in the past some of the most curious variations in numbers. The 1911 Report (paragraph 123) dealt with the variations noticeable then, as they accounted in some measure for the decrease in the total Hindu popula tion The figures for the last two censuses are given in the margin with detail by religion Hindu Chuhras have decreased by 47 per cent., while Chuhras among other religions show a varying degree of increase

Chuhra.	Hindu.	Sikh.	Ad Dharmi.	Muslim (included in Musalli figures).	Christian.
1	2	3	4	5	6
Strength in 1921	693,675	42,478		274,934	
Strength in 1911	389,224	103,17	86,548	434,644	34,908
Actual Variation	—223,291	+126,771		+39,710	
Percentage Variation	—46·8	+294·3		+13·9	

The Ad Dharm religion has been returned for the first time while the figures for Christian Chuhras are available now but were not so in 1921 and even now a large number of Christian Chuhras have evidently not returned their caste As has already been remarked both in 1921 and now Christians were not to be pressed to state the caste. There is a large increase among Sikh Chuhras, many of whom not included in the figures quoted have abstained from returning the caste The rise among Muslim Chuhras and Mussallis (the counterpart of Mazhabis among Sikhs) is proportionately equal to the rise in th Muslim population. The marked decrease among Hindu Chuhras is mainly due to a large number of them having been returned as Ad Dharmis and also to no cast having been returned by most of those who have adopted Vedic Dharm.

The fluctuation in the number of Chuhras in certain districts is of much significance, and the figures below show some of the most prominent variations

Chuhra	Hindu		Ad Dharmi	Sikh		Muslim	
Locality	Absolute increase or decrease 1921—31	Variation per cent	Number in 1931	Absolute increase or decrease 1921—31	Variation per cent	Absolute increase or decrease 1921—31	Variation per cent

Amritsar	—59,987	—70 3		+2,000	+66 1	—22	—68 8
Sheikhupura	—21,758	—76 1	2,891	+458	+727·0	+385	+175 0
Montgomery	—3,333	—30 3	4,424	—1,271	—69 9	—189	—93 1
Lyallpur	—31,777	—74 6	9,498	+5,717	+1,753 7	+493	

The small decrease among Hindu Chuhras in Hoshiarpur and the larger one in Jullundur appears to be entirely due to Ad-Dharmi having been returned as religion by a large number of Chuhras in the two districts, while in Karnal the small increase among Hindu Chuhras is partly attributable to the same cause and partly to the meagre increase in the total population In Lahore, Amritsar, Ambala, Ferozepore and Ludhiana, a large part of the increase among Sikh Chuhras has evidently taken place at the expense of Hindus, while in the first three districts very few Chuhras have returned themselves as Ad-Dharmis. There was a great struggle in Ludhiana, Ferozepore and Lyallpur between Sikhism and Ad-Dharm to appropriate the Chuhras In the colony districts, Montgomery and Sheikhupura, Ad-Dharm has won over many adherents from amongst Chuhras In the districts west of the Ravi, Muslim Chuhras are returned as Mussallis, and those returned as Chuhra and appearing in the table above show a large increase in certain districts, particularly in Ferozepore and Lahore In 1921 as at this census all Chuhras with the entry of Chuhra in the religion column of the general schedule were thrown into Hindus, and the increase among Muslim Chuhras is not necessarily the result of conversion and might merely indicate that the religion was specified on the present occasion, while in 1921 it was not.

The figures of Chuhras of all religions, Hindu, Sikh and Muslim, as well as of Mazhabis among Sikhs and Mussallis among Muslims, are given in the margin for the Province and its administrative divisions for the last six censuses If the members of this caste, which is fairly evenly distributed in the Province had increased at the same rate as the general population, and there is no reason to believe that they did not, the figures would have risen from 1,039,000 in 1881 to 1,423,000 in 1931, or in other words there would be about 400,000 more Chuhras now than there are according to the census figures This is accountable by conversions to Christianity and Ad-Dharm as well as by the failure to return a caste on the part of numerous Chuhras who became Sikhs

(Chuhras of all religions) Mussalli, Mazhabi Sikhs etc

Locality	1881	1891	1901	1911	1921	1931

266 The Chhimbas now number 96,269 as against 124,585 in 1921 Their figures are liable to intermingle with those of Dhobis and Darzis At this census

Chhimba.

some members of these castes have returned themselves as Tank Kshatriyas. The figures below which relate to the last two censuses, show that there is

PARTICULARS.	Chhimba.			Darzi			Dhobi.		
	Hindu.	Muslim.	Sikh.	Hindu.	Muslim.	Sikh.	Hindu.	Muslim.	Sikh.

a decrease among Hindu and Sikh Chhimbas and Dhobis which may be due to several causes such as the change of occupation or return, by the educated section of the community of the caste Tank Kshatriya with or without the return of traditional caste The deficit is, as can be ascertained from the Caste Table greater in the districts where the return of Tank Kshatriya is particularly large. The Tank Kshatriya, as already remarked, is a new caste tabulated on the present occasion for the first time The actual figures of Tank Kshatriyas are a little smaller than the decrease among the Sikh Chhimbas and Dhobis, and should have been larger in view of the natural increase during the last decade The only explanation is that some of the members of these castes in order to improve their status or for some other reason have been successful in returning themselves as Khatri pure and simple or have become Sikhs and omitted to return the caste The detail of occupational castes, included in Tank Kshatriya according to the census schedule appears in Appendix I to this Chapter and the summary figures have been given above under each traditional or occupational caste.

There is an increase among Hindu and Sikh Darzis probably due to the increasing number of the members of these castes taking to tailoring which is preferred to washing. Among Muslims all the three classes, Darzi Dhobi and Chhimba, show an increase

Dagi and Koli.

267 The Dagis and Kolis have risen from 165 164 in 1921 to 182,233 in 1931 or by 10·3 per cent Their home is the Himalayan Natural Division but they are also found in the submontane districts of Hoshiarpur and Gurdaspur The figures for Gurgaon relate evidently to Kolis, who are Hindu Julahas of the south-east and have nothing to do with Dagis and Kolis of the Himalayas.

Dhiman Brahman.

268 Some occupational castes other than Chhimbas and Dhobis, who also seem anxious to escape the bonds of occupational grouping are carpenters, blacksmiths masons, etc Many members of these classes have returned themselves as Dhiman Brahman, a term which means learned or illustrious Brahman, while in the south-east a section of Lohars and Tarkhans claims to be Jangida Brahmans. According to the instructions issued at this census the enumerators were to record the caste Dhiman Brahman or Jangida Brahman, as returned but were also to add within brackets the traditional caste Lohar or Tarkhan. It is quite possible that some of them might have returned themselves as Brahmans pure and simple Th following remark occurs in the 1911 Census Report, page 393

"I wished to treat as Tarkhan (operative) or Loha (blacksmith) labourers who have had to be recorded in returning themselves as such, although their rights are not clearly established."

The figures of Dhiman Brahmans with a detail of traditional occupation as far as available appear in Imperial Table XVII and are also given in Appendix I to this Chapter The figures are small as in the case of Tank Kshatriyas, and the majority of Dhiman Brahmans have returned their traditional caste as shown in the margin The figures of Districts and Kalsia State which had considerable number of returns have been given separately The cause of the small number of these entries could be gathered from a letter of the Dhiman Brahman Mahasabha, United Provinces, addressed to the Superintendent of Census Operations United Provinces, whose instructions concerning the entry about this caste were similar to those issued by me The Dhiman Brahmans are found in large numbers in the United Provinces, and in their case too the hesitation in returning the occupational caste is based on a desire to get rid of it altogether An extract from the letter is quoted below

Statement showing total strength of Dhiman Brahmans of Ambala District

Territory, District or State	Dhimans with Traditional Caste						
	Total	Total Hindu	Total Sikh	*Lohar*		*Tarkhan*	
				Hindu	Sikh	Hindu	Sikh
1	2	3	4	5	6	7	8

British Territory	*12,707*	*12,164*	*543*	*2,796*	*117*	*6,233*	*210*
Ambala	8,116	7,817	299	2,266	79	4,944	210
Kangra	2,220	2,220					
Hoshiarpur	1,872	1,680	192	494		1,110	
Jullundur	357	305	52	36	38	116	
Punjab States	*826*	*818*	*8*	*156*		*518*	*8*
Kalsia	767	740	8	150		517	8

"No doubt this way of entry would work well in the case of the Dhiman Brahmans, who are engaged in the trade of barhai (carpenter) lohar (blacksmith), etc, but in the case of those who follow none of these trades and are doctors, school masters, contractors, Lawyers, merchants, etc, there will be some difficulty Will there be no entry as to the occupational caste in their case below the Dhiman Brahman as in fact they have none? The undersigned begs to be enlightened on this head"

To this the Superintendent of Census Operations, United Provinces, replied "if a member of the caste who was now, say a school-master, belonged originally to the Lohar group his caste should be returned as Dhiman Brahman with the addition of lohar his occupation being shown in the relevant column as a school-master

This reply was evidently contrary to the wishes of the community, which was actuated by a desire to dispense with the name of the occupational caste altogether and under the circumstances the new term Dhiman Brahman evidently lost much of its attraction

The Hindu and Sikh Lohars and Tarkhans often get intermingled as will be noticed when we discuss their figures Numerous Lohars and Tarkhans claim to belong to the caste or group, called Ramgarhia, after the name of the Sikh *misal* of that name founded by Jessa Singh, carpenter, who was the builder of Ramgarh at Amritsar The Hindu carpenters often go over to Sikhism with a view to be classed as Ramgarhia, but those who reside in the Himalayan tract or the south-eastern districts and continue to remain in the Hindu fold return themselves as Dhiman or Jangida Brahmans

The figures of the Ramgarhia caste were not sorted on the present occasion, but it is presumed that this caste has a large number of adherents in the central districts, namely, Ambala, Ludhiana, Hoshiarpur, Jullundur, Amritsar, Gurdaspur and Lahore

269 The Dumna is a depressed class of the hills, and is more or less the equivalent of Chuhra Like the Chuhra of the plains he does other jobs also besides scavenging, and works in bamboo The figures for the districts in which Dumnas are mostly found are given in the margin for this and

Dumna.

District	*1921*	*1931*	Variation percentage
1	2	3	4
Kangra	10,084	10,305	—1·5
Hoshiarpur	2,300	1,540	—33·0
Sialkot	1,924	718	—62·7
Simla	148	119	—19·6
Ambala	30	30	
Lyallpur	1,784	21	—98·8

the last census. The 1921 figure for Lyallpur seems to have been swollen owing to the inclusion of the caste Dum (minstrel) or some similar caste To a similar substitution the presence of Dumnas in Sialkot District is attributable On the whole it could be said that Dumnas like Chuhras are diminishing in numbers as shown in the margin by the total figures for the Province, mainly owing to absorption in other castes. The figures for some of the past censuses are no doubt, affected by wrong classification, particularly those of 1911

CASTE.	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
DUMNA	66,159	64,046	83,264	72,230	36,649	32,033

Faqir. 270 The Faqir is among Hindus at least the most curious collection of mendicants and members of religious orders, as their figures in the margin will indicate. The paucity of females is due to the prohibition of marriage in the case of most of the orders. The returns at different censuses vary according to the fancy of the Faqirs themselves or the enumerators. The larger differences are due possibly to the inclusion or exclusion from time to time of *Gosains* the only order of Hindu Faqirs who marry and multiply As a matter of fact Hindus sometimes take exception to be described by the term *faqir* and prefer to be recorded as Jogi, Bairagi etc

PARTICULARS	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Strength (Hindu Faqir)	3,211	20,291	23,109	19,977	20,844	21,181
Proportion of females per 1,000 males	270	Not available.	302	415	541	514

The figures of Muslim Faqirs are given in the marginal table. They are found mostly in the eastern and central Punjab and all of them are not mendicants as 54 per cent. of the workers among them are engaged in occupations other than begging such as exploitation of animals and vegetation and industries.

PARTICULARS	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Strength	191,900	194,839	247,228	224,406	223,815	232,949
Proportion of females per 1,000 males	806	Not available	812	787	819	834

Ghirath. 271 This caste is met with mostly in Kangra and the neighbouring State of Mandi. The figures for the last six censuses are given below as also the figures for Chamba and the Simla Hill States

DISTRICT OR STATE.	GHIRATH					
	1881.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Kangra	104,716	116, 35	120,343	119,279	116,729	120,909
Mandi	715	895	933	976	1,1.1	1,171
Chamba	96	111		72	122	48
Simla Hill States	831	871	213	852	670	443

The Ghirath, Bahti and Chang are really the names of the same caste in the various hill tracts. The figures of Ghiraths are likely to be affected by the inclusion or exclusion of Bahtis and Changs.

Hissar and Karnal, though considerable numbers are also found in Gurgaon, Hoshiarpur Sialkot and Ferozepore. Their figures for this and the last census

Mianwali	462	34	—·92				

are here given for the Province and for each district and state Only in Rohtak Hissar and Karnal and in the neighbouring States of Jind, Loharu, Pataudi and Dujana has there been an increase among Hindu Jats. There are minor increases in Montgomery and Multan, mainly due to colonization of Hindu Jats who have recently come over from Hissar and Rohtak Districts. The rise among Hindu Jats is nowhere very large and in the three districts where they predominate it is proportionate to the small increase in the total population of the south-eastern part of the Province Moreover among Jats of this part of the Province there are no accretions from other castes.

Hindu-Sikh Border.

276 The figures for Hindu and Sikh Jats of certain districts and states are quoted below —

In these districts Hindu Jat were an important section of the population in the past but are no longer so being superseded by Sikh Jats. The transition from Hinduism to Sikhism in Lahore Amritsar and Ferozepore obviously took place more than fifty years ago and these district had a considerable element

of Sikh Jats even in 1881 The almost complete disappearance of Hindu Jats in Ludhiana and Gurdaspur has occurred during the last fifty years, while in Maler Kotla and Faridkot the figures of Hindu and Sikh Jats fluctuated violently between 1881 and 1901 and during the last thirty years Hindu Jats have almost entirely disappeared owing to conversion to Sikhism The moral is obvious enough and the extent of change from Hinduism to Sikhism is to be gauged from the amount of Sikh influence in each locality This transition seems by no means to have come to an end, and the Hindu Jat is, I think, likely to be completely replaced by the Sikh Jat except in the south-east of the Province

277 For the reasons explained in the Chapter on Religion the number of Sikhs in the Province had, for a considerable period following the British occupation, been on the decline The strength of Sikh Jats who are the backbone of the community, had also been reduced accordingly Sikhism has, however, regained its strength with the lapse of time and its process of absorption continues The total increase among Sikh Jats can be gauged from the table in the preceding paragraph, which shows that during the last fifty years Hindu Jats have decreased by nearly half a million while Sikh Jats have risen by more than a million In the central Punjab particularly in Hoshiarpur and Jullundur Districts several reasons can be assigned for the conversion of Hindu Jats to Sikhism The foremost of these is the intensive campaign of religious preaching (*parchar*) carried on by the Akalis during the last decade At the time of the census considerable propaganda was carried on by the Akalis, who went round the villages of Hindu Jats and induced them to return themselves as Sikhs My inquiries show that the propaganda was successful in many villages Very few of the Hindu Jats of the two Districts mentioned above are in the Army, and it is considered easy by a Jat to get himself enrolled as a soldier if he offers himself as Sikh Jat For this reason also the tendency to go over to Sikhism has gained ground Numerous Khalsa schools have been established in rural areas during the last decade, and the children of Hindu Jats, who form a small minority in these schools, do not feel very happy and so in many cases their parents give them *pahol* and convert them to Sikhism It may be said here that a Hindu Jat of the *Doab* districts has no scruples whatever in converting his children to Sikhism while he himself remains a Hindu Another circumstance worth mentioning is that Sikh Jats during the last decade, mainly owing to the Akali movement, have developed a prejudice against giving their daughters in marriage to Hindu Jats, formerly inter-marriages between Hindu and Sikh Jats were of common occurrence This has also served as an incentive for many Hindu Jats to adopt Sikhism The figures for some other districts given in the margin will, I think, be of considerable interest in this connection, though the increase is not in all cases due to conversion from Hinduism The number of Sikh Jats in districts, such as Rohtak, Gurgaon, Simla, Jhelum, Rawalpindi, Attock, Mianwali, Jhang, Muzaffargarh and Dera Ghazi Khan, is very small indeed, and most of the Sikhs enumerated there are Khatris Aroras or artisans.

Muslim Jat.

278. The Muslim Jats are the most numerous of all the Jats, numbering 2,941 395 (1 604 028 males and 1,336,707 females). The total figures and variations since 1881 are compared below with those of Hindu and Sikh Jats. The figures are given for the Province, British Territory and its administrative divisions, and Punjab States.

The increase per cent. during the last fifty years among Muslim and Sikh Jats is almost equal while among Hindu Jats there has been a decrease of about 400 000 or 31·2 per cent. in British Territory The home of Muslim Jats is the Western Punjab while in the Ambala Division their number is very small and it has slightly decreased during the last decade. In the Jullundur Division the smaller increase is attributable to emigration to the colonies. The increase in the other Divisions is enormous, particularly in the Rawalpindi and Multan Divisions. For variations among the figures of Muslim Jats, which are due consid rably to inclusion of other castes, the paragraph on Rajputs may be referred to.

Properties of workers among Jats.

279 Coming to the changes in the occupations followed by Jats we find that among Hindus there are now 3 777 more male and 101 706 more female workers as compared to 1921 This is indeed remarkable The proportion of femal workers per 1 000 males was 132 in 1921 and is 422 now as compared to 41 and 54 respectively among Sikh Jats. Absolute figures of workers among Hindu Sikh and Muslim Jats for the two censuses are noted in the margin. The total figures of Muslim and Sikh Jats show an increase in all occupations (see Table XI of 1931 and XXI of 1921) The Jats receive

Jats (workers / others plus working dependants)		1931	1921
1		2	3
Hindu	Males	515,179	5 1,402
	Females	167 1.5	65,710
Sikh	Males	750 181	635,791
	Females	150,952	20,111
Muslim	Males	914,347	781,095
	Females	53,733	33,180

accretions from other castes and tribes, but as only the selected castes were sorted the sources of absorption are not known According to Appendix II at the end of this Chapter 18,373 persons belonging to some of the selected castes have returned themselves as Jats In their case traditional castes were also recorded, and it was therefore possible to classify them

Jhiwar.

280 The figures of Jhiwars and Kahars in the case of Hindus are best studied together Kahars are tabulated separately for the first time on the present occasion, the figures of the two being lumped together in Table XVIII

Hindu	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Jhiwars and Kahars	258,507	275,252	281,591	213,212	215,210	186,673

From the marginal figures it will be seen that Hindu Jhiwars and Kahars have been on the decrease since 1901, mainly due to a certain number of them returning a higher caste, such as Mehra, Mehra Rajput At this census 11,520 Hindu Jhiwars have returned other castes, chiefly Rajput The instructions were that the traditional caste should also be recorded by the enumerator within brackets after the caste claimed, and Jhiwars claiming Rajput status have been included among Jhiwars There might be more who returned no caste or returned a higher caste without revealing the traditional caste For the castes claimed by Jhiwars a reference may be made to Appendix II

As regards Muslim Jhiwars, their figures should be studied along with Muslim Kahars and Machhis, with whom they often get intermingled The total figures are given in the margin for the six censuses along with separate details for each class Among Muslims this class has steadily risen except during 1901-11 The Machhis have gained at the expense of Jhiwars, but very few seem to have claimed a higher caste

Muslim	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Jhiwar, Kahar and Machhi	282 153	328,282	350,007	308,895	367,676	425,751
Jhiwar and Kahar	114,279	133,261	114,285	69,193	86 720	110,960
Machhi	167,874	195,021	235,722	239,702	280,956	314,791

Julaha.

281 The Hindu and Sikh Julahas have decreased during the last decade from 58,575 and 5,632 to 53,488 and 5,449, respectively The decrease may be due to the return of no caste or a caste under a different name such as Koli The variations since 1881 are given in the margin, the figures for Muslim Julahas being also quoted Muslim Julahas have shown a considerable increase throughout except at the census of 1911 when the total population also showed a decline Among Muslims 151,321 or 78 1 per cent of workers, among Hindus 6,252 or 13 9 per cent , and among Sikhs 299 or 37 6 per cent are engaged in the traditional occupation of weaving Among Hindus the percentage is smallest and the desire to discard caste proportionately greater The number of literates in the three communities is 19, 14 and 70 *per mille* of the population aged 7 years and over, respectively At this census 16,511 Julahas claimed some other castes, mainly Rajput

Caste and Locality	*Variation since 1881 (from Table XVIII)*				
	1891	1901	1911	1921	1931
1	2	3	4	5	6
Total A. B C D	27,202	31,399	—24,840	10,443	28,840
Hindu A B C	6,424	—1,087	3,099	874	—5,440
Sikh C	—531	3,338	—167	—810	—632
Muslim A B C D	20,367	28,691	—26,021	13,347	33,175

Kahar.

282 See paragraph dealing with Jhiwars

Kamboh.

283 The total number of Hindu, Sikh and Muslim Kamboh is given in the margin for the six censuses. The interchange between the Hindu and Sikh Kamboh and the consequent large increase among the latter are at once noticeable, while Muslim Kamboh have also largely increased. The caste being particularly industrious and of good standing in many localities shows a tendency to expand. Muslim Kamboh show a decrease in Gujrat and Sialkot. In the former district they have mostly returned themselves as Arains, while in the latter the decrease is due to many Kamboh having left the district on being allotted col ny land in Sheikhupura. The most remarkable feature about Kamboh, indicated by the marginal table, is their great expansion in colony districts as compared with their home districts. The figures are typical of the migration of large tribes from one area to another in recent times, a practice which seems accordi ng to tradition to have been fairly common in a remote past.

Particulars.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6
Total	129,863	136,816	1[illegible]2,780	171,136	186,870
Hindu	32,044	38,222	54,156	22,073	23,606
Sikh	27,497	34,148	41,283	67,913	61,151
Muslim	44,834	45,014	77,333	65,825	76,839

KAMBOHS

District	1901	1911.	1921	1931.
1	2	3	4	5
Karnal	13,879	12,480	12,873	13,801
Ambala	8,278	7,618	7,436	8,279
Jullundur	6,317	6,122	8,879	6,340
Lahore	22,816	22,118	23,226	30,670
Shaikhupura			10,915	13,029
Shahpur	857	1,259	1,387	1,889
Montgomery	23,024	27,207	22,490	19,227
Lyallpur		17,980	20,941	20,012
Multan	1,917	1,301	2,222	3,237

Kashmiri.

284 The Kashmiri has always been tabulated as a caste though it is really a nationality The instructions were that Kashmiri was not really the name of a caste but if a person could give no other caste he should be recorded as Kashmiri. Kashmiri Hindus are as a rule Brahmans. In the census tables Kashmiri has always appeared as a separate caste, almost all the persons returned as such being Muslims. Kashmiris are found spread over the central Punjab fairly evenly The figures in the margin show their total strength in the Province for the last six censuses. The increase since 1921 amounts to 33 per cent which is mainly due to the fact that at this census which was held in the end of February about three weeks earlier than in 1921 all the periodic migrants from Kashmir who usually return home in March were still in this Province.

Caste.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6
Kashmiri Muslims	149,633	160,853	169,808	174,812	186,340

The occupational distribution of 1 000 Kashmiri workers in 1921 and 1931 is given below

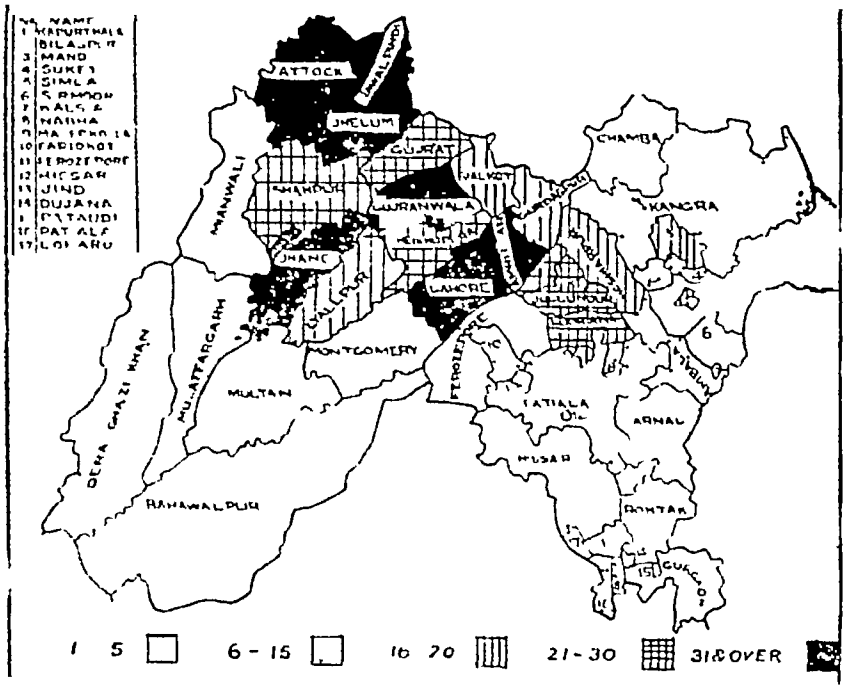

Particulars	Year	Exploitation of animals and vegetation.	Industry	Transport	Trade.	Public Force.	Public Admi nistration.	Arts and Professions.	Domestic service.	Unproductive.	Others.
1	2	3	4	5	6	7	8	9	10	11	12
Proportion per 1,000 earners	1931	256	144	171	48	126	27	21	21	162	26
	1921	283	162	165	62	85	12	14	17	91	33

About one-fourth of the Kashmiri workers are weavers, one-fifth are engaged in other industries and a little less in cultivation, one-eighth being traders and one-tenth unspecified labourers.

285 The Khatri is one of the most important Hindu castes, and like Brahmans, Rajputs and Gujjars very few of its adherents are going over to Sikhism. There may be some Khatris who on conversion to the Sikh faith refrain from returning caste, but such cases must be rare as Khatris never think poorly of their caste and have no objection to returning it. The figures of Hindu and Sikh Khatris are given in the margin for the last six censuses. Hindu Khatris have shown a large increase at every census except in 1911 when they decreased like the total population. Sikh Khatris in any considerable numbers are found only in the central and northern Punjab. The map in the margin shows the proportion *per mille* of Khatris in the total population of each district or state. They show a particularly large intercensal percentage of increase in areas, where colonization has been in progress during the last decade or where their number is inconsiderable. Such areas are noted below — **Khatri.**

Actual Population of Khatris

Religion and Locality	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7

Multan	54·0	Jhang	34·0	Gujranwala	26 6	*Kapurthala*	16 5
						Rohtak	15 5

286 The Kumhar is a large occupational caste being mainly Muslim. Their figures for the three communities are given in the margin. A slight interchange between the Hindu and Sikh Kumhars is apparent enough while Muslims show a uniform increase. The increase among Sikhs at the expense of Hindus is noticeable from the marginal figures, relating to Ludhiana, Gurdaspur, Amritsar, Sialkot, Sheikhupura and the **Kumhar.**

Religion	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Hindu	164,024	177,491	184,023	157,532	165,879	156,913
Sikh	10,701	12,569	15,022	23,435	24,438	31,238
Muslim	288,131	323,242	359,418	358,208	383 952	423,430

District	*Hindu Kumhar* 1921	*Hindu Kumhar* 1931	*Sikh Kumhar* 1921	*Sikh Kumhar* 1931
Ludhiana	2,218	1,681	756	1,440
Gurdaspur	7,665	7,508	583	1,539
Amritsar	2,705	1,463	5,424	7,146
Sheikhupura	183	496	4	93
Sialkot	9,097	8,678	467	1,224
Multan Division	3,795	2,743	911	2,121

districts of the Multan Division. The reverse however seems to be the case in Hoshiarpur District where during the last decade Hindu Kumhars have increased from 3 43 to 5 079 and Sikh Kumhars have come down from 686 to 338 It is quite possible that the decrease among the latter is due to some of them having abstained from returning their caste The Muslim Kumhars have increased in all districts except in Sialkot and Ferozepore where kumhars of all religions show a decrease evidently due to menials, especially Kumhars and Tarkhans taking to agriculture Among Kumhars 13·2 per cent of Hindu workers, 8 2 per cent of the Sikh and 10 5 per cent of the Muslim are engaged in the traditional occupation of pottery while 0 4 7 4 and 3·2 per cent respectively are cultivators.

Lohar. 287 The figures of Lohars and Tarkhans had better be studied together

Caste, Religion and Locality	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Lohar Total A.B.C.D	291,498	253,279	317,959	379,817	221,193	333,910
Hindu A.B.C	101 180	110,335	130,816	82,204	83,383	74,483
Sikh A C	24,361	23,287	30 453	34 865	20,029	16,480
Muslim A.C.D	164,957	119,657	156,577	201,532	117 430	11,5 6
Tarkhan Total A.B.C.D	344,335	621 18	678,361	837,9 7	674,972	654,853
Hindu A.B.C.	13,970	213,861	233,934	161,309	101,822	146,727
Sikh A.C.D.	113,067	134 109	148,901	194,417	139,377	133,446
Muslim A.C.D	226,146	273 191	295,45	294,8 7	313,153	346,859

The total provincial figures for the six censuses are given in the margin by religion. Hindu Lohars have not shown an increase like other castes and may therefore be said to have been really decreasing all along while Sikh Lohars too have been decreasing though only since 1911 The Hindu Tarkhans, who are much more numerous than Lohars, have been decreasing considerably since 1901 while Sikh Tarkhans, who showed an increase till 1911 have been decreasing since The large increase among Sikh Tarkhans while it lasted was obviously at the expense of Hindus. The decrease in their number since 1911 is due to the discarding of the term Tarkhan and more recently to the adoption of Ramgarhia as their caste The Hindu Lohars and Tarkhans in Kangra Hoshiarpur and Ambala have returned themselves as Dhiman Brahmans and in the south-east they have claimed to be Jangida Brahman. In the central districts Hindu Lohars and Tarkhans as well as their Sikh counterpart have returned their caste as Ramgarhia in increasing numbers at this census.

The Muslim Lohars and Tarkhans have never looked back. The two castes taken together show an increase of 46 6 per cent since 1881 as compared to 51 per cent which is the figure for the rise in total Muslim population. This disparity is mainly due to the fact that some Muslim Lohars and Tarkhans too return as their caste an agricultural tribe such as Awan or Rajput. In towns an educated Lohar or Tarkhan particularly when he holds a job in the public service would invariably abstain from returning his traditional caste

Among Tarkhan and Lohars 41 per cent of Hindu, 50 per cent of Sikh and 60 per cent of Muslim worker follow the traditional occupations as against 58 61 and 7 per cent in 1911 respectively It appears that among Hindus and Sikhs a comparatively large proportion of Lohars and Tarkhans has given up the traditional occupations and the percentages quoted for them would have been even smaller but for the fact that when traditional occupation is given up the return of caste is in many cases also given up

288 See paragraph dealing with Jhiwar **Machhi**

289 The figures of Mahtams illustrate with great clarity the social evolution of tribes The figures are reproduced in the margin for the Province from Table XVIII and for each district from Table XVII and the corresponding tables of the past censuses Mahtams for the most part have within the last few generations regained Rajput status, from which according to Sir Denzil Ibbetson they had originally fallen That all sections of Mahtams—Hindu, Sikh or Muslim—were endeavouring to attain their lost status and that practically half of the Hindu and Sikh Mahtams have succeeded in so doing, so far as the census is concerned, is borne out by the figures which show a big decrease during the last decade At this census nearly 2,000 of them returned their caste as Rajput, but as their traditional caste was also recorded, they were not included among Rajputs **Mahtam**

District	Religion and caste	1881	1891	1901	1911	1921	1931

290 The Mali and Saini are in reality one and the same tribe, the former being considered inferior The recent variations in the strength of these two castes have been discussed in the last Chapter (paragraph 218), a reference to which will show an increasing tendency among Malis to return themselves as Sainis **Mali**

291 The Meghs are an inferior caste, being more akin to Chuhra than to any other caste with this difference that their traditional occupation is weaving and not scavenging The home of Meghs is Gujrat, Sialkot and Gurdaspur The figures for these districts are given in the margin for the last six censuses They show a decrease in Sialkot, while in the case of the other two districts, the caste has practically disappeared at this census My enquiries show that in Gujrat Meghs have adopted Vedic Dharm and returned their caste as Arya instead of Megh, while in Gurdaspur they have returned themselves as Sikh or Ad-Dharmi without stating their caste **Megh**

District	Megh					
	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Gurdaspur	6,373	6,818	6,501	6,360	6,130	803
Sialkot	28,705	32,405	34,198	30,483	21,163	20,923
Gujrat	1,373	1,438	1,540	1,019	1,028	

Meo. 292 The Meo is an agricultural tribe, confined almost entirely to the Gurgaon District. The number of Meos in Ferozepore has increased during the last decade from 127 to 3,253 owing to their presence as labourers on the Sutlej Valley Project (in the Ferozepore Tahsil) and in the Abohar and Fazilka *zamindri*.

The Meos are a backward tribe and agriculture is their traditional occupation. During the last decade their percentage of literacy has gone up from 6 to 9 mainly as a result of the uplift work among them. The occupational distribution of 10 000 Meos according to the last three censuses is given below

Occupational distribution of 10,000 Meo earners for the last three censuses.

Year.	Traditional occupation (Cultivation)	Exploitation of animals and vegetation	Exploitation of Mineral.	Industries.	Transport.	Trade.	Public Force.	Public Administration.	Arts and Professions.	Persons living on their income.	Domestic service.	Contractors, clerks, soldiers, &c.	Labourers unspecified.	Beggars, &c.
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
1911	8,182	478	39	158	83	78	7	11	53		18	1	29	13
1921	8,685	233	4	72	32	31	22	14	14	1	11	4	10	11
1931	8,729	249		45	26	27	12	24	23	4	18	1	2	11

Miras. 293. The figures of Mirasis, who are almost entirely Muslim, are given in the margin for the last six censuses. There is a decrease among Hindu Mirasis of Karnal Ambala and Kangra probably due to return of some other caste-name such as Bhat. There is a decrease from 9 033 in 1921 to 1 113 in 1931 among Hindu Mirasis of Sialkot due to most of them having adopted Vedic Dharm and returned their caste as Arya. More recently in certain districts there has been a tendency among Muslim Mirasis to claim Qureshi as their caste but as they are mostly found in villages, the Patwaris who carried out the preliminary enumeration were able to record the traditional caste. Only 1 441 Mirasis claimed dual castes as shown in Appendix II Jat being the favourite caste claimed, the next best being Pathan and Sheikh.

Caste.	1881.	1891	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Muslim Mirasi	191,283	217,822	230,174	221,682	223,164	241,600

Mochi. 294 The Hindu Mochis have been grouped with Chamars. They are shoemakers of the eastern districts, who have settled mostly in the urban areas of the central Punjab the largest numbers being found in Lahore District with a preponderance of males.

The Muslim Mochis have increased during the last decade everywhere except in the Ambala Division, where they are not at all numerous, the only considerable number being returned from Hissar. The strength of the Muslim Mochis in the central and western Punjab is shown in the margin for the last six censuses. The figures show a steady increase fairly commensurate with the general rise in total population.

Particulars.	1931.	1921	1901	1911	1921	1931
1	2	3	4	5	6	7
Muslim Mochis	333,424	379 192	403,726	406,643	421,792	441 616
Percentage increase		13 6	7·0	·2	4 8	8 5

The proportion of Muslim Mochis engaged in the traditional occupation of shoe-making is 699 *per mille* of th total workers and that of Hindu Mochis 618.

295 Like Muslim Mochis Mussallis are only found in the central and western Punjab There is hardly any Mussalli in the Ambala Division and not a single one in the Punjab States except Bahawalpur During the last decade Mussallis have increased from 361,098 to 412,300 or by 14 2 per cent The percentage of rise is particularly large in colony districts, to which Mussallis migrate in lagre numbers mainly to become agricultural labourers and workers in factories The figures for colony districts are given in the margin In villages Mussallis are mostly engaged either in their traditional occupation of sweeping or in field labour But in urban areas besides their traditional occupation they take to a large variety of jobs and are found working as weavers, cooks, water-carriers, fireworks-makers, dyers, bandsmen, etc This would show that a chuhra on conversion to Islam takes to odd jobs, denied to a Hindu chuhra The figures below give the present occupational distribution of Mussallis Mussalli.

MUSSALLIS

District or State.	1921	1931	Variation percentage	Percentage increase among total Muslim
1	2	3	4	5
Gujranwala	16,833	19,001	18 2	17 6
Sheikhupura	9,066	16,062	77 2	34 8
Gujrat	40 403	48,465	20·0	10 9
Shahpur	56,402	63,773	13 1	14 0
Lyallpur	31,362	37,069	18 2	21 2
Bahawalpur	13,742	27,230	98 2	23 5

Occupational distribution of 10,000 *Mussalli earners of both sexes for* 1931

Sex.	(Sweeping) Traditional occupation.	Exploitation of animals and vegetation	Exploitation of Mineral	Industries	Transport	Trade	Public Force	Public administration	Arts and Professions	Persons living on their income	Domestic service	Contractors, Clerks, Cashiers, etc, other wise unspecified	Labourers unspecified	Beggars, Prostitutes, criminals and inmates of jails and asylums
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Male	2,993	3,029	34	592	205	82	13	40	52	7	215	5	972	216
Female	486	132	2	48	6	5			5	3	24	1	135	68

It is apparent that only a small number is engaged in the traditional occupation of sweeping, the proportion of women workers also being small (144 *per mille* of male workers as against 262 *per mille* among Chuhras) Most of the Mussallis are engaged in agriculture or are labourers unspecified, who are mainly agricultural

296 The Hindu Nais in the Province number 102,628 as against 107,655 at last census As already remarked at an early stage in this chapter some Hindu Nais were anxious to be classed as Kulin Brahmans, but were not permitted to return this caste as Kulin Brahman is a high caste of Brahmans in Bengal As many as 8,770 have, however, returned their caste as Nai Brahman, and 4,380 (including both-Muslims and Hindus) as Rajput A number of Nais have adopted Vedic Dharm or Sikhism, probably with a view to get rid of their caste The figures below are illustrative Nai

Caste	1911	1921	1931
Vedic Dharm Nai		411	966
Total Hindu Nai	108 600	107,655	102,628
Sikh Nai	34,342	34,360	41,820

	1881	1891	1901
Hindu Nai	127 481	184,273	143 257
Sikh Nai	21 459	25 317	25 058

District	Hindu Nai		Sikh Nai	
	1921	1931	1921	1931
Ferozepore	2,898	2 105	4,317	5,009
Ludhiana	3 559	2 239	3,182	5 012
Hoshiarpur	7 626	7,700	465	748
Lahore	1 044	812	3 776	4,104
Amritsar	2 062	1 050	5,566	5,984
Lyallpur	1 077	[illegible]	1 [illegible]	1 [illegible]

The Muslim Nais are found all over the Province, the only parts where they are not numerous being the Himalayas and the south-eastern tracts. They have shown an increase at all censuses except in 1911 when the total population decreased. The figures of the last six censuses for all the districts and states in the plains are given in the margin together with the percentage increase as well as the increase among total Muslims of the same areas. Many Muslim Nais like their Hindu and Sikh brethren seem only in recent times to have developed an aspiration to be called Rajputs. In fact, an association, known as the Punjab Rajah Central Committee and comprising representatives of the Nais of all the three communities, existed at the time of the census with headquarters at Lahore and pressed for permission to return a caste other than Nai. Their contention was that Nai was an occupational term and that Nais of different localities and different religions belonged to various castes, most of them being Brahmans, Rajputs or Jats. It is quite likely that many Nais, specially those engaged in occupations other than traditional were successful in returning some other caste. So the figures do not represent the actual strength of Nais.

Particulars.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Muslim Nais (A.C.D.)	174,534	190,778	206,760	204,180	218,310	235,823
Variation		12·1	8·6	—3	8·9	8·0
Increase among total Muslims (A. C. D.)		9·9	12·6	0·7	5·9	10·5

Od

297 The figures of the Hindu and Muslim Ods of the Punjab plains are given in the margin. The Ods are a nomadic tribe and might be enumerated in one district at one census and in another at the next. They are found mostly in the districts where canals exist, more particularly where canals are under construction, as Ods both male and female are considered very useful labourers for excavation work. They have been returned in considerable numbers from Gujranwala since 1891, Montgomery since 1911 and Karnal since 1921. In Gujranwala their presence dates back to the time of the construction of the Lower Chenab Canal and in Montgomery to that of the Lower Bari Doab Canal. In the canal colonies they also assist in the building of walls for the colonists. As many as 2,486 Ods have returned their caste as Rajput, but have been included among Ods.

Caste.	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Od Hindu	11,540	13,216	17,911	20,378	18,282	19,883
Od Muslim	4,065	10 023	8,174	11,170	10 182	13,041

Pakhiwara.

298. The Pakhiwara is a small criminal tribe mostly Muslim. The variation in its strength in the central Punjab is shown in the margin. Altogether 49 Pakhiwaras returned other castes, 19 returning themselves as Jats and 20 as Rajputs.

Caste and Locality	1891.	1901.	1911.	1921.	1931.
1	2	3	4	5	6	7
Pakhiwara ( )	3,741	3,674	3,585	3,711	2,901	3,100

Pathan.

299 The Pathans enumerated in the Province number 345 438 as against 261 729 in 1921 which means an increase of 32 per cent. The statement on the next page shows their absolute strength and percentage increase in each district and the Punjab States, the persons with Afghanistan as their birth place having been excluded. The increase per cent. among all Muslims of each locality has also been quoted. The particularly large increases have been registered in Lahore (11 189) Mianwali (10 440) Gurdaspur (6 914) Sialkot (6 031) and Attock (5 852) and part of the increase in Lahore Gurdaspur and

Sialkot is due to the caste Pathan having been claimed by some other castes, notably Kakkezai

District	Number of Pathans in thousands 1931	Increase per cent among Pathans	Total Muslim increase per cent	District	Number of Pathans in thousands 1931	Increase per cent among Pathans	Total Muslim increase per cent

300 The Qasabs now number 127,198 They have shown an increase at almost all censuses as will appear from the marginal figures the increase being particularly large in the canal colonies during the last decade The figures of the south-eastern districts, however deserve a closer study The Qasab of the south-east, often designated as *Beopari*, claims to be Sheikh If he returns himself as Sheikh Beopari as he often does, we know his traditional caste is butcher, but there is no help when he returns himself merely as Sheikh The figures of Qasabs and Sheikhs for certain units of the eastern Punjab are given in the margin The large increase in the Sheikhs of Ambala and Rohtak is, no doubt, mainly due to the remarkable decrease among Qasabs In Hissar and Gurgaon the 1921 figures of Qasabs seem to have been exclusive of Beoparis, re-included in 1931 The complete disappearance of several thousands of Qasabs in Patiala State since 1911 is an eloquent testimony in support of this view

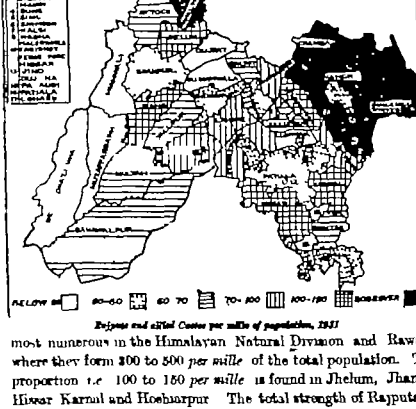

Qasab.

Caste	1881	1891	1901	1911	1921	1931

Rajput.

301 As already remarked, the caste Rajput is next to Jat, the largest collection of castes or tribes in the Province. It will be well in the first instance to see the proportional distribution of Rajputs in the total population of each district and state, which is indicated by the map in the margin. The Rajputs are most numerous in the Himalayan Natural Division and Rawalpindi District where they form 300 to 500 *per mille* of the total population. The next highest proportion i.e. 100 to 150 *per mille* is found in Jhelum, Jhang Montgomery Hissar Karnal and Hoshiarpur. The total strength of Rajputs and allied races such as Kanet, Rathi, Rawat, Thakar Dhund and Gakkhar are given in the margin for the six censuses, for thus only is a fair comparison possible. The bulk of the Rajput population is Muhammadan and Hindu and like Khatris very few Hindu Rajputs have gone over to Sikhism. The big increase among Rajputs during the last decade does not appear to be due to natural increase. The respectability of Rajput caste is beyond doubt the term Rajput literally means a Raja (ruler) son. On the present occasion more than at any previous census numerous people belonging to various other castes not quite so elevated in the social scale have claimed Rajput status and in many cases succeeded in returning themselves as a Rajput without disclosing their traditional caste. The line separating Jats from Rajputs is rather vague in certain localities. For example the bulk of Jhang who had previously been recorded mostly as Jats, have returned themselves at this census as Rajputs. A possible cause of variation in the number of Muslim Rajputs is, therefore the inclusion or exclusion of certain sections of agricultural tribes. In the case of Hindu Rajputs the variation is partly explained by the decrease among such castes as Sunars and Jhiwars

Rajputs and allied Castes per mille of population, 1911

Caste	Religion	1881	1891	1901	1911	1921	1931
		1	2	3	4	5	6	7
Total Rajputs including Dhund and Gakkhs		2,130,791	2,282,824	2,291,584	2,196,853	2,308,178	2,791,460

Variation per cent			+4·5	+3·1	−9·0	+1·8	+23·9

inclusive of Mehras The figures of certain districts given in the margin furnish some evidence on this point Coming now to the big increase among Muslim Rajputs during the last decade, we should separate the districts in which the intercensal increase has been more or less proportionate to the rise in the total Muslim population and those in which it has been in excess The two sets of figures for each district and Punjab States are given in the table below The percentage increase in the case of the first six districts in the

Actual variation among Hindu Rajputs and certain other Hindu castes

table, *viz*, Jullundur, Karnal Ambala, Attock, Ferozepore and Rohtak requires no explanation being proportionate to the general rise in the population In the case of some of the other districts an explanation is called for, though not so easy to furnish in all cases The rise is small in Simla, Kangra, Muzaffargarh and Mianwali, while there is actual decrease in Dera Ghazi Khan and Shahpur, and in all these districts Muslim Rajputs are very few The next higher rates of increase are in Gujranwala, Ludhiana, Shahpur, Gurgaon, Hoshiarpur, Sheikhupura and Sialkot, and in these districts too there are not many Rajputs The somewhat higher percentage increase in Gujrat, Gurdaspur, Jhelum Jhang and Amritsar is mainly attributable to some members of certain agricultural tribes and occupational castes having returned themselves as Rajput The increase in Lyallpur, Multan and Montgomery is mainly due to the influx of immigrants Coming to the districts where Rajputs are really numerous, we find that the increase in Hissar is mainly due to the return home of demobilized Rajput soldiers and to the fact that Pachadas, who return themselves as Rajputs, had temporarily migrated from the District in considerable numbers at the time of the 1921 census owing to the prevailing drought The large increase in Jhelum and Rawalpindi is due largely to the return home of ex-soldiers and to

members of some other castes having returned themselves as Rajputs on the present occasion. The occupational castes in many cases have claimed Rajput status, particularly the well to-do persons following occupations other than traditional in urban areas

We may now proceed to estimate the extent, to which Rajputs of all religions have gained through accretions from other castes. We will do this with the help of their age distribution at this and the last census.

**Total Rajput and allied castes including Dhund and Gakkhar*	2,359 179
Probable survivors (aged 10 and over in 1931)	1,903,857
Actual number returned as Rajput aged over 10 in 1931	2 009 823
Absorption from other castes among Rajputs aged 10 and over	105 966
Absorption among children under 10 years of age	6 867
Total absorption for all ages	112,833

In addition to this absorption, which is mainly attributable to Rajput having been returned as their caste by persons, who at the 1921 census returned other castes, there are 94 485 persons who claimed the Rajput caste but were at the time of tabulation included in the traditional caste, which had also been recorded in accordance with the instructions issued. Among these the principal figures relate to Sunars (33 000) Jhiwars (8 700) Julahas (8.500) Mochis (5,500) Tarkhans (4 450) and Nais (4 400)

Ramdasias. 302. The Ramdasias are practically the same as Chamars and the figures of the two have been discussed in the paragraph on Chamars.

Saini. 303 The Sainis have been dealt with along with Malis, to whom they are very much akin.

Sansi. 304 The Sansis are scattered all over the south-eastern and central parts of the Punjab and 70 per cent. of them, or 25 823 out of 33,228 returned their caste as their religion Their figures were thrown into the Hindu religion as at last census it being recognized that there is no tribal religion in the Punjab Of the remaining 7 403 Sansis 4 930 returned their religion as Hindu, 82.. as Muslim 1,238 as Sikh and 384 as Ad Dharmi. The instructions in the Census Code which were the same as at last census, required that in the case of persons professing a tribal religion such as Sansis, the caste should be recorded in the column of religion, and but for this instruction many more Sansis would probably have returned some definite religion. The variation in the number returned as Sansis is given in the margin since 1881 together with the variation among those who returned themselves or were classed as Hindus on each occasion. The occupational distribution of the Sansis for the last two censuses is given below —

PARTICULARS.	1881—91.	1891—01	1901—11.	1911—21.	1921—31.
1	2	3	4	5	6
Sansis in A. C. D. All religions	+2,249	+3,782	—1,881	—7,097	+10,800
Hindus	+256	+3,412	—1,636	—1,822	+3,875

Occupational Distribution of Sansi earners per mille.

Year	Traditional occupations (rural).	Exploitation of animals and vegetable products.	Exploitation of minerals.	Industries.	Transport.	Trade.	Public Force.	Public Administration.	Life and Professions.	Persons living on their income.	Domestic service.	Construction, clothing, sanitation and supplies.	Unproductive.	Beggars, prostitutes, criminals and persons of no definite occupation.
1	3	4	5	6	7	8	9	10	11	12	13	14	15
1921	104	573	4	22	21	20	2	4	7	1	12	37	3	1
1931	46	434	2			46		3	9		17	1	43	304

Account of absorption is taken and the process reached on an average 223 in comparison with the figures for 1911.

It is apparent that Sansis are taking more and more to agriculture, having been allotted colony land and established in settlements under State supervision There is a large decrease under their traditional occupation of crime, but it is rather doubtful whether the traditional occupation was really returned by the person enumerated or merely presumed by the enumerator

Sarera.

305 The figures of Sarera for the last six censuses are given in the margin. This caste like other low castes has shown no advancement in numbers The figures for its home districts are given in the second table, and show that many Sareras, particularly in the Jullundur and Hoshiarpur Districts, have become Sikhs during the last decade

Particulars	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7
Sarera B C	10,792	11,366	9,587	10,743	9,873	11,230

Sayad.

306 The figures of Sayads enumerated in the Punjab plains are given in the margin for the last six censuses The increase at each census and the total increase among all Muslims of the same locality is also given It is well known that Sayads receive accretions from other castes, many people claiming Sayad as their caste as soon as they become well-to-do

SAYAD

Locality	1881	1891	1901	1911	1921	1931
1	2	3	4	5	6	7

caste as Sheikh Qasab of the south-eastern part of the Province being prominent in this respect It is quite likely that in some places respectable Kashmiris also returned their caste as Sheikh The table on the last page shows the increase per cent. among Sheikhs in each district and state together with increase among all Muslims A fertile cause of variation in the number of Sheikhs is the intermingling with them of the figures of Qureshis, separate figures for which are unfortunately not available on the present occasion.

Sunar

308. The figures of Sunars are given in the margin for the last six censuses The figures of Sikh and Muslim Sunars are given only for the central and western plains, where alone they are found in considerable numbers. There is an increase among Sunars of all religions during the last decade, though the maximum figures for Hindu and Sikh Sunars were reached in 1901 and 1911 respectively The reason for the decline in their numbers is that Hindu Sunars sometimes return themselves as Rajput, while Sikh Sunars in many cases return no caste. The Muslim Sunars, who are comparatively fewer have returned the maximum number at the present census

Caste, Religion and Locality	1881	1891.	1901.	1911.	1921.	1931
1	2	3	4	5	6	7
Sunar Total A B C D	144,903	161,097	174,628	154,803	157,090	158,533
Hindu do	106,374	118,114	127,111	100,716	77,231	80,028
Sikh C D	13,900	17,230	18,846	27,222	15,067	13,306
Muslim C D	21,235	26,811	26,656	26,183	*5,780	22,201

As regards the internal distribution Sunars seem to be a mobile race, travelling to places where they anticipate prosperous conditions or a good income though the figures of districts like Lahore and Amritsar are probably deflated on account of return of other castes, such as Tank Mair Mair Rajput.

District	SUNAR.					
	Hindu		Sikh.		Muslim.	
	1921	1931.	1921.	1931.	1921.	1931
Hoshiarpur	1,569	1,270	91	243	226	428
Jullundur	1,678	1,394	180	731	999	995
Ludhiana	1,998	2,159	455	1,238	119	777
Ferozepore	2,187	1,567	1,233	2,274	2,197	2,131
Gujranwala	2,985	2,717	943	911	930	1,141
Rawalpindi	1,439	947	1,498	734	221	58
Montgomery	1,200	1,496	229	2,980	2,489	2,508
Lyallpur	2,803	2,017	721	705	1,718	2,230
Jhang	3,210	2,316	25	21	210	382
Feroze pur State	985	1,144	31	122	1,117	985

The figures in the margin will be of interest. At this census 33 000 Sunars returned their caste as Rajput, but as their traditional caste was also recorded they were included among Sunars. The other caste claimed in considerable numbers is Khatri returned by about 2 000 Sunars It is probable that many more Hindu Sunars will return Rajput or Khatri as their caste at future censuses.

Tank Kshatriya

309 In the beginning of this Chapter a reference was made to the representation made on behalf of certain associations of Hindu and Sikh members of the occupational castes of Chhipis (calico-printers), Darzis (tailors) Chhimba (washermen) etc. to have their caste recorded as Tank Kshatriya. In the eastern part of the Province the claim was that they be recorded as Rohilla Tank Kshatriya whatever that may mean. Many members of this caste have risen to responsible positions in public service and business and claim that calico-printing tailoring etc are mere occupations and that their true caste is Tank Kshatriya Their argument is contained in the following abstract from a representation of theirs.

"The word Chippi, Chhipa or Chimba takes its origin from "Shilp which is but another name for handicraft, an art highly spoken of by the learned men of the past, and constituting compulsory course of training for the Kshatriyas of the olden days. Hence it was that Pt Ram Chander J some Lohs and Kachis, Dhobi Rankis some Daryeshans, etc. ed Pandit must (Pandev) were all expert in "shilp "art or handicraft."

Their claim to return Tank Kshatriya as their caste was conceded with the proviso that the traditional caste should also be returned and added in brackets after the caste claimed, thus to make a comparison possible with the corresponding figures of the past censuses The following correction slip was issued for the guidance of the enumerators

"Persons returning their caste as Tank Kshatriya will be recorded as such in column 8 with their traditional caste, such as tailor or calico printer being added within brackets, thus Tank Kshatriya (tailor), Tank Kshatriya (calico printer)"

Appendix I at the end of this Chapter shows the figures of Tank Kshatriyas for each district and state as well as the number of each traditional caste returned

TANK KSHATRIYA

Caste	Hindu	Sikh
Total	11,321	26,055
Total with traditional Occupation recorded	7,676	17,848
Arya	3	
Chhapagar		82
Chhimba	4,082	11,349
Darzi	2,035	6,121
Dhobi	68	18
Jhiwar	2	
Kahar	10	
Kumhar	7	
Lohar	1	
Rajput		81
Ramgarhia	44	2
Saini		3
Sunar	468	102
Tarkhan	36	

The provincial summary is given in the margin The traditional caste was recorded in the case of 25,524 out of 37,376 entries, and it is apparent from the table that more Sikhs than Hindus have claimed the new caste and that the castes which have mainly contributed to it are Chhimba and Darzi It will not be a matter for surprise if on future occasions many Tank Kshatriyas return their caste merely as Khatri, a leading caste which at this census appears to have been returned by many Ahluwalias also

Tarkhan.

310 See paragraph regarding Lohars

Teli.

311 The Telis—Hindu, Sikh and Muslim—show an increase Teli is an occupational caste, whose members are evidently not at all anxious to give up their traditional occupation or to claim a higher caste The increase is, no doubt, due to the attractiveness of oil-milling, which is one of the few prosperous indigenous industries at present

Hindu	(1931)	1,373
Sikh	,,	42
Muslim	,,	344,027

'No Caste' Entry

312 Numerous persons at this census abstained from returning a caste, and many of them deliberately It is quite possible that some of the omissions in the column of caste were accidental, having crept in during one of the several stages of the census operations The number of Brahmanic Hindus, who did not return a caste, is negligible, being 4,419 males and 2,397 females out of a total population of over eight millions, and Caste would thus seem to have, as ever, its grip on the population In the case of 50 per cent of the followers of Vedic Dharm, numbering 341,390 persons (194,355 males and 147,035 females), the entry in the caste column was Arya, which is the equivalent of 'no caste' entry in the case of Brahmanic Hindus (mainly Sanatanists) The main figures of 'no caste' entry among Brahmanic Hindus relate to Amritsar (1,626), Gujrat (1,191), Gujranwala (914) and Gurdaspur (685) It is rather surprising that Lahore, claiming as it does a large number of people with advanced views, has had very few such entries Some 'no caste' entries, practically all relating to females, in places like Suket and Jhelum, seem to be due to a statistical error, as also those relating to an excessive number of males in Amritsar On the whole, it can safely be said that very few of the Brahmanic Hindus have refrained from returning their caste although there was a considerable propaganda against the return of caste, particularly that emanating from the Jat Pat Torak Mandal My conclusion is that people prefer to return a higher caste to returning no caste, and that the caste system has still a great hold on them.

Representation of Castes in Services.

313 It will I think be of interest to notice the representation of the members of different castes, tribes or races in the gazetted civil services. The table below showing the actual figures of classification has been compiled from the History of Services of the Gazetted Government Servants serving in the Punjab and on deputation in the North West Frontier and Delhi Provinces. *

73 Castes of the Gazetted Government Servants.

(As on 1921)	Members of the Indian Civil Service.	Military Officers and Lascars.	Indian Political Service.	Extra Assistant Commissioners.	Tahsildars.	Judicial Department.	Income-Tax Department.	Indian Police Service.	Provincial Police Service.	Forest Department.	Indian Educational Service.	Provincial Educational Services, etc.	Miscellaneous.	Medical Department.	Public Health Department.	Jail Department.	Buildings and Roads Branch P. W. D.	Irrigation Branch P. W. D.	Hydro Electric Branch P. W. D.	Miscellaneous Departments.	Total all Departments.

(1) Includes 1 unspecified Gakhhar and 4 unspecified Bhattis.
(2) Includes 13 Christians, but see also members of the Indian Civil Service.
(3) Includes 1 Brahman, 3 Jats, 2 Khatris, 1 Rajput, 2 Sayads and 2 Sheikhs, who are also shown under Extra Assistant Commissioners. 14 also includes 1 Sayad counted under Medical Department.
(4) This will not be the exact total of the entries in the line as certain officers mentioned in the notes (3) and (4) have been counted twice.

The figures for the important castes having any considerable representation are detailed separately while other castes have been lumped together at the

* Last edition corrected up to the 1st July 1921

bottom, where also the number of officers whose caste or nationality is not specified has been given It may be pointed out that in some cases terms are put down which are not really castes For example, it is not clear whether the term Mahajan as used in the afore-mentioned book refers to Aggarwal, Arora or Sud It is possible that the people belonging to the same caste may have returned themselves under two different categories for instance, Sheikh and Kashmiri and Qureshi and Sheikh It is apparent from the above table that the greatest number of gazetted officers are Christians Among Indians, the caste Khatri contributes the largest number followed by Rajput, Jat, Arora, Sheikh, Brahman, Sayad, Aggarwal, etc This order happens to be in accord with the proportion of literacy among these castes rather than with their numerical strength

The Christians are comparatively most numerous in the Public Works Department, the Police and the Indian Civil Service The Khatris are mostly employed in the Public Works Department, the Medical Department and as Extra Assistant Commissioners The largest proportion of Rajputs is claimed by Extra Assistant Commissioners, the Provincial Education Service and the Irrigation Branch of the Public Works Department The Jats have their best representation in the cadres of Extra Assistant Commissioners and Tahsildars and also in miscellaneous Departments, particularly Agriculture The Aroras are serving mostly as Extra Assistant Commissioners, in the Irrigation Branch of the Public Works Department and in the Judicial Department As regards Sheikhs, the Irrigation Branch of the Public Works Department claims most of them followed by the Judicial Department and the Provincial Education Service The Brahmans for the most part are employed as Extra Assistant Commissioners and in the Irrigation and Medical Departments, and Sayads as Extra Assistant Commissioners and Tahsildars and in the Judicial and Medical Departments The largest proportion of Aggarwals is claimed by the Irrigation Branch of the Public Works Department and the Judicial Department The adres of Extra Assistant Commissioners lice service As many as 89 members s, 5 are Sheikhs 4 Khatris, 3 Aroras, a, Aram, Jat and Rajput each Four have not specified their castes

Page 359, line 17 from bottom, *after* Jat *add* Pathan

It will also be of considerable interest to examine the caste distribution of the elected members of the Punjab Legislative Council, and the table in the margin gives the necessary information The Jat and the Rajput, the two most numerous castes, have the greatest representation, a fact which reflects the influence exercised by them over the members of occupational castes residing mostly in rural areas The next in point of numbers is Khatri, followed by Arora, Brahman, Sayad, Sheikh, Aggarwal, Aram and Gujjar Here again it is possible that there is an over-lapping of Sheikh and Kashmiri The other castes noted in the table have only one member each

The castes of the elected members of the Punjab Legislative Council

Caste	Strength	Caste	Strength
Aggarwal	2	Kashmiri	1
Ahir	1	Khatri	5
Arain	2	Mahajan	1
Arora	5	Meo	1
Awan	1	Nai	1
Balmiki	1	Qureshi	1
Bengali	1	Rajput	12
Biloch	1	Sayad	3
Bodla	1	Sheikh	3
Brahman	3	Sikh	1
Gujjar	2	Total all castes	71
Jat	22		

EUROPEANS AND ANGLO-INDIANS.

Strength and Distribution.

314 There are in this Province 20 099 persons (14,848 males and 5,251 females) belonging to the European and allied races including 4 Armenians. Of these the British subjects are 19,523 (males 14,597 and females 4 926) or 97 1 per cent. of the total The distribution of European and allied races in the various districts of the Province is as below —

Number of persons	*Districts*
Under 20	*Hoshiarpur Ludhiana Muzaffargarh and Dera Ghazi Khan*
20 *to* 50	*Hissar Rohtak Karnal Gujranwala Sheikhupura Gujrat Shahpur and Jhang*
51 *to* 100	*Gurgaon Kangra Mianwali and Lyallpur*
101 *to* 500	*Amritsar Gurdaspur Jhelum Attock and Montgomery*
501 *to* 1 000	*Simla and Multan*
1 001 *to* 2 000	*Jullundur and Ferozepore*
Over 2 000	*Lahore Ambala Sialkot and Rawalpindi*

The figures are large for the districts having cantonments. In 1921 the corresponding figure for Multan was 1,396 and the decrease may be due to the reduction of European troops in the cantonment.

It appears that as in the past many Anglo-Indians, especially those of fair complexion have returned themselves as Europeans.

The total number of Anglo-Indians recorded at this census is 3 025 persons (2 181 males and 1 444 females) those returned from British Territory being 2 993 (males 1,925 and females 1 1"0) The distribution of Anglo-Indians in the districts of the Punjab is as under —

Districts containing persons	
Below 5	*Hoshiarpur Shahpur and Dera Ghazi Khan*
6 *to* 20	*Rohtak Karnal Kangra Attock Lyallpur and Muzaffargarh*
21 *to* 50	*Hissar Jullundur Amritsar Gurdaspur Sialkot Gujranwala Sheikhupura Gujrat Jhelum, Montgomery and Jhang*
51 *to* 100	*Gurgaon Ferozepore Mianwali and Multan*
101 *to* 500	*Ambala and Simla*
501 *to* 1 000	*Rawalpindi*
Over 1,000	*Lahore*

Comparison with the Past Returns.

315 Below is given the strength of European and allied races (including Armenians) and Anglo-Indians in the Province as at present constituted at each of the last six censuses

Particulars.	1931.	1921	1911.	1901.	1891	1881.
1	2	3	4	5	6	7
European, etc.	20,099	21,275	21,370	25,229	24,782	22,430
Anglo-Indians	3,025	4,199	3,513	2,393	2,845	1,441
Total	23,124	25,474	24,883	27,622	27,627	24,771

The figures show that Europeans increased steadily up to the 1911 census or until before the Great War after which their numbers began to decrease and at the present moment they have declined by more than 2 000 as compared with

1881 This decrease may be partly attributable to the fact that the possibility of their figures becoming swollen by the inclusion of Anglo-Indians was less on the present occasion than formerly At past censuses the householder was as a rule called upon to fill the household schedules, but on the present occasion in order to ensure entries being made according to instructions trained English-knowing enumerators were employed for the purpose, and for the guidance of the enumerators the term Anglo-Indian was defined as any person, born in India, whose father, grand-father or more remote ancestor in the male line was European It may be remarked that the figures of Europeans should not tally with the number of those who have returned a European country as their birth-place, as the figures include a number of European children born in India The table in the margin shows the number of persons who returned one or other of the European countries as their birth-place, and it is apparent that the number of persons born in European countries is 16,989, or 3,110 less than the total number of Europeans in the Province The total number of European children under 13 in the Punjab at the time of the census was 2,769 Evidently many of them were born in Europe. On the other hand, there may be some Indians who were born in Europe, but these must be very few It seems that many Anglo-Indians return England as their birth-place and European as their race, and thus insert an element of doubt into both categories of the figures

Place of birth (From Table VI) 1	Persons 2
D—COUNTRIES IN EUROPE	16,989
(I) Inside British Dominions	
England and Wales	14,430
Gibraltar	4
Irish Free State	35
Malta	4
Northern Ireland	563
Scotland	550
United Kingdom unspecified	3
Total (I)	*15,589*
(II) Outside British Dominions	
Austria	1
Belgium	45
Denmark	1
France	31
Germany	38
Greece	1
Holland	2
Italy	5
Latvia	1
Norway	1
Portugal	8
Rumania	2
Russian Union	7
Spain	4
Sweden	3
Switzerland	3
Turkey in Europe	37
Total (II)	*193*
(III) Europe unspecified	1,207

The Anglo-Indians in the Province have more than doubled during the last fifty years, but they show a decrease since 1921 This might be due to the further alienation of some of them in favour of Europeans, while some others of a rather dark complexion have probably been returned as Indians

All the persons who have returned English as mother-tongue number 26,204 which exceeds the number of European and allied races and Anglo-Indians by 2,480 The difference is small and might be due to the fact that some of the Indian Christians as well as others are taking more and more to English as their medium of speech, so that many of them treat English as their mother-tongue

APPENDIX I TO CHAPTER XII.

The Table below shows the number of persons belonging to occupational castes such as *Dorzi Chhimba* and *Chhipi* returning themselves as *Tonk Kshatriya* and *Lohars* and *Tarkhans* returning themselves as *Dhiman Brahmans*

APPENDIX I

VITAL STATISTICS

System of Registration.

The system of registering vital statistics in the British Districts is as follows In the rural circles, births and deaths are reported by village chaukidars (watchmen) who are provided with two books, one for births and the other for deaths, in which entries are made, on the chaukidar's report, by a resident of the village who can read and write, and the lambardars (village headmen) of each village are responsible that these entries are duly made The chaukidars take their books with them to the Thana (police station) at their fortnightly visits and from these books and from oral enquiries made from chaukidars, the Police *Muharrirs* compile the fuller registers which they maintain. Fortnightly returns are submitted, through the Superintendent of Police, to the Civil Surgeon The Civil Surgeon forwards fortnightly, monthly and annual returns, compiled from the Police returns, to the Director of Public Health, Punjab From the returns so received, monthly and annual returns are prepared in the office of the Director of Public Health, Punjab The Police *Muharrirs* receive a small monthly allowance in all cases in which the work is done satisfactorily In Municipal towns, when a birth or death occurs in any household, the head of the household makes a report within three days of the occurrence or causes a report to be made orally or upon a form provided by the Committee If for any reason he is unable to do so, the report is made by an adult member of his family, or failing any such, by an adult male servant, or in the case of births, by the midwife employed in the accouchement If a birth or death occurs in a household in which there is no grown up male member, the report is made by the sweeper of the mohalla (street or lane) The mohalladar (a responsible resident of the mohalla) and the sweeper are jointly and severally responsible that there is no omission In most Municipalities, rules or bye-laws have been adopted under the Municipal Act, regarding the proper registration of births and deaths In towns where no special bye-laws for the registration of vital statistics have been prescribed by the Municipal Committee, but where the watch and ward is done by the Municipal Police the constable of each beat reports all deaths occurring in it The police are assisted by the sweepers of the mohallas, who supply the information regarding births Birth and death registers are kept at Municipal Registry Offices, and weekly returns compiled from the registers are forwarded to Civil Surgeons for incorporation in their district weekly returns A weekly return showing the births and deaths registered in all Municipal towns with a population of ten thousand and upwards each, and a monthly return showing the births and deaths registered in all districts, are published in the *Punjab Government Gazette*

The accuracy of the registers maintained by the Police and Municipalities is tested by the Director of Public Health, Punjab, and Assistant Directors of Public Health and District Medical Officers of Health, Civil Surgeons, Superintendents and Assistant Superintendents of Police, Tahsildars, Naib-Tahsildars, Kanungos, Superintendents of Vaccination and Vaccinators All omissions of births and deaths are supplied in the registers after verification by the Civil Surgeons, and the District Officers are asked to punish the defaulters

APPENDIX II

LEPROSY

In January 1923 His Excellency the Viceroy constituted an Indian Council of the British Empire Leprosy Relief Association with a view to the inauguration of an active campaign to eradicate leprosy from India and nominated His Excellency Sir Malcolm Hailey K C S.I. C.I.E. the then Governor of the Punjab as one of his Vice-Presidents. An appeal was issued to India by His Excellency the Viceroy at whose instance His Excellency the Governor of the Punjab on the 28th of January 1925 issued a similar appeal enlisting in the Punjab the support of all who by reason of their rank position and affluence, were in a position to assist in the beneficent work. To assist in the raising of funds and the organization of measures to eradicate the disease from the Punjab His Excellency constituted a Provincial Committee of the British Empire Leprosy Relief Association. This task was successfully completed in the year 1926 and a sum of Rs. 2 07,551/13/9 was raised by private subscriptions. The amount collected was transferred to the Indian Council of the British Empire Leprosy Relief Association and the provincial committee then ceased to function. The Punjab Branch, however has been receiving its quota from the Central organisation and in order to utilize this money in accordance with their instructions, a technical committee was appointed by the Punjab Government to deal with the problem and to suggest measures from time to time for stamping out leprosy from the Province

The Punjab Census Report for 1921 shows that there were then 2 737 lepers in the Punjab of which 1 027 were residing in British Territory and 1 110 in the Punjab States so the problem was not of a great magnitude in the Province In this connection it might be stated that Leprosy Hospitals (Leprosaria) exist at Tarn Taran Ambala Rawalpindi Palampur and Subathu. These hospitals are run by the Mission to Lepers in the East with the assistance of a grant-in-aid from Government the amount of which during the year 1925 was approximately Rs. 7" 000/

During the year 1927 the work carried out by the Provincial Committee comprised a survey of the local situation, both on the administrative and technical sides, as it was felt that before any plan of campaign could be drawn up it was necessary to explore the ground.

Dr L R Mehta D I H. was deputed to the School of Tropical Medicine and Hygiene at Calcutta to undergo special training under Dr Muir in the diagnosis of Leprosy and in modern methods of treatment, to visit the Leper hospital in the Province and to make a detailed study of their organisation and equipment with the permission and assistance of their respective Superintendents.

With the object in view to stamp out Leprosy from the Kangra district, where alone the disease was then known to be endemic, arrangements were made to send to Calcutta all Assistant Surgeons and Sub-Assistant Surgeons serving in the Kangra district for special training in the diagnosis and treatment of Leprosy at the expense of the British Empire Leprosy Relief Association.

During the year 1929 at the request of the Committee the Punjab Government sanctioned an honorarium of Rs. 70/ per mensem (half of which represented a grant from Government and the other half from the funds of the Association) for the Medical Officer in charge of the Palampur Asylum where no qualified Medical Officer was then employed

Steady progress was made during the year 1930 in giving effect to the policy advocated by the Punjab Branch of the British Empire Leprosy Relief Association

It was decided to engage a whole-time leprosy expert and subordinate staff for the purpose of carrying out a leprosy survey in the Kangra district The Medical Officer provisionally selected for the post on the recommendation of Dr Muir was however not available, but after this decision had been reached information was received that the Indian Council proposed to send a leprosy-survey (treatment) party under the charge of Dr Santra to the Kangra district during the summer of 1930 As the result o the survey made by Dr Santra it was discovered that in 81 villages situated in three zails of the Kangra district 52 persons were suffering from leprosy whilst in the Kulu tahsil 28 lepers were found in 29 villages and in the Banjar tahsil of Kulu sub-division, 54 villages contained 13 lepers The survey party also visited the Mandi State, in which 50 lepers were discovered in 47 villages and an appreciable number of lepers was also discovered in the Chamba State In addition a rough survey was carried out in two tahsils of the Amritsar district and 15 lepers were discovered in 116 villages These circumstances necessitated consideration of the question of appointing a whole time leprosy expert to carry out surveys with a view to obtaining more detailed information in regard to the incidence of the disease, whilst Dr Santra recommended the appointment of such an officer and also pointed out the need of improving the training of medical men and more especially medical students in the diagonsis and treatment of the disease

Apart from these activities Dr Santra and his party held leprosy clinics, each of seven days duration in Kangra district under arrangements made by the Inspector-General of Civil Hospitals Punjab, and the Civil Surgeon, Kangra. These clinics were attended by some 21 doctors and their travelling expenses were borne by the British Empire Leprosy Relief Association Dr Santra also visited the King Edward Medical College, the Amritsar Medical School and the Women's Medical School at Ludhiana where he delivered lectures and gave demonstrations on the diagonsis and treatment of leprosy to the staff and students

The Assistant Surgeon in charge of the Civil Hospital, Palampur, who was placed in medical charge of the Palampur Leper Asylum, continued to draw the fee of Rs 35/- per mensem from the Punjab Branch of the British Empire Leprosy Relief Association

A grant of Rs 2,500/- was made to the Subathu Leper Asylum to meet part of the cost of providing a new dispensary and a small clinical laboratory

During the year 1931, considerable progress was made in extending anti-leprosy work in the Punjab The Punjab Government, after obtaining the views of the Commissioners and Missionary Societies, approved of the proposal of the Provincial Committee in regard to the appointment of visiting committees for the inspection of leper asylums in the Punjab

Almost all the Medical Officers in charge of dispensaries in the Kangra district have already received the special training in the treatment of leprosy at Calcutta or from Dr Santra who visited that district During the last four years, 14 Medical Officers and four private medical practitioners were sent to Calcutta at the expense of the Association

In regard to the training of medical students the late Special Leprosy Officer of the Committee delivered a lecture-demonstration on leprosy to the students of the King Edward Medical College and the Amritsar Medical School.

An annual grant of a sum of Rs. 100/ was given to each of the five leper asylums in the Punjab (Tarn Taran, Ambala, Palampur Subathu and Rawalpindi) to provide comforts for the inmates. In addition to this, a sum of Rs. 3 000/ was granted to the Honorary Superintendent, Tarn Taran Leper Asylum, to meet in part the cost of erecting an operation block and a sum of Rs. 1,250/ was given to meet half the cost of equipping it. Also, a sum of Rs. 2,500/ was granted to the Subathu Leper Asylum to meet part of the cost of erecting and equipping a small laboratory

With a view to obtaining a detailed knowledge in regard to the incidence of Leprosy in the Punjab a whole-time medical officer with M.B B.S. qualifications (Dr Jaikaria) has been appointed with the object of carrying out leprosy surveys and of supervising the work of a leprosy survey propaganda party During the period from March 1st to December 1931 he did much valuable work and it need scarcely be said that the expenditure of Rs. 4 753/2/1 incurred in this connection has been fully justified by the result. In all 956 villages were surveyed during this period of nine months, and 444 cases (or 253 12 per 100 000 of population) of leprosy were discovered in 190 villages. Seven leprosy clinics were opened for the treatment of 397 cases.

An extensive propaganda was carried out by means of magic-lantern shows and wide distribution of pamphlets on Leprosy As many as 95 magic-lantern lectures were delivered by Dr Jaikaria.

APPENDIX III

DEPRESSED CLASSES

Depressed Classes

The question as to what are 'depressed classes' has of late aroused considerable interest The term 'depressed classes', according to the definition laid down by the Census Commissioner for India, comprises —

(i) *All persons who would pollute a caste Hindu by proximity or touch*

(ii) *All those who are forbidden entry into the interior of ordinary Hindu temples*

(iii) *Those who are not allowed to draw water from the village well*

The castes which fall under the first category are comparatively few, and at present no caste in this Province is supposed to cause pollution simply by coming within a certain distance of the caste Hindu In private buildings, however no caste Hindu would let a sweeper enter his residential room, not to speak of the latter ever dreaming of going into the kitchen In many cases the shadow of a Chamar or a Chuhra would pollute a caste Hindu if he happened to be in his own house but he would not mind such a thing in a playground or on a public road The tradition or habit has much to do with the dread or contempt of untouchables

The matter of temple-entry is also a very vexed question My inquiries show that old temples such as those in Southern India where the practice or tradition has attained the force of ritual do not really exist in this Province The question is to which castes are and which are not allowed access to the different temples is still difficult of solution It appears that a *Purbia Dhobi* would not be allowed to enter a temple but a Hindu barber, especially if well dressed, would not be objected to Large urban areas are not the places for a real test of disqualification for temple-entry as there the particulars and antecedents of an individual are not known, but in villages having temples for public worship such restrictions can be enforced

The backward castes when numerous enough in any locality usually avoid such unpleasantness by having a place of worship of their own, however humble In some cases when a family of a depressed caste (for instance Chuhra) is isolated in a place they would erect a mud temple to *Guga* in size no larger than an ordinary Indian *chuhla* (hearth) and adorn it with peacock feathers

The question of who can and who cannot draw water from the village well is also usually full of difficulties The main criterion is as to whether it is easy or difficult for the people to obtain drinking water in the locality, and the scruples disappear in proportion as the difficulty to secure water increases The untouchables usually have their own wells, but very often would take water from the water-courses of wells or canals In cases where the whole population depends on water stored in ponds they usually obtain it at a separate *ghat* at some distance from that of caste Hindus

Thus it will be realised that the question as to who are depressed classes is not at all easy to determine, and some castes will always be difficult to classify The measure of reaction to be manifested by these classes at the time of separate enfranchisement also depends upon various considerations In some places where there is an overwhelming influence of caste Hindus the depressed classes may not come forward to claim the vote This may well happen in Rohtak, Hissar and Gurgaon The reaction in Jullundur, Hoshiarpur, Lyallpur, Sheikhupura and Montgomery is likely to give the depressed a much longed

for opportunity to secure a large voting strength. In Ludhiana Ferozepore and Ambala the Sikh element will probably retain its hold but it will not be a case of plain sailing and the struggle may easily take a serious turn

Estimate of the Probable Number of the Depressed Classes.

The Social Map in the beginning of this Report shows the population of the castes which have been classified as depressed according to the above tests out of those for which we had the figures Such castes comprise all Ad Dharmis and the Hindu castes Bawaria Chamar Chuhra Dagi and Koli Dumna Megh, Od Ramdasia, Sansi and Sarera and their strength in British Territory comes to 1 310 709 It is true that we have not got the figures for some other castes, which are also untouchable but all of them are numerically unimportant An estimate of the present population of these minor castes * made on the basis of the 1921 figures indicates their population to be 131,300 Thus the total figure for the Hindu and Ad Dharmi depressed classes will be nearly a million and a half. If all the depressed classes get the vote their population is likely to be slightly larger as the indications are that in that case they may be joined by some of the low classes among Sikhs and Muslims It may be remarked that the aggregate of Hindu depressed classes does not include the figures of the members of those classes, who have been converted to Vedic Dharm and returned no caste or merely Arya in the column of caste.

It is necessary to add that the strength of each of the depressed castes, named above, by religion and sex are given in Imperial Table XVII for each district and state Similar figures of Ad Dharmis are given in Imperial Table XVI

The figures of total population and literacy for each Tahsil in British Territory are given for Ad Dharmis and four of the most numerous depressed castes, namely Chuhra Chamar Dagi and Koli and Sansi in Provincial Table II In the Social Map in the beginning of this Volume the light-blue portion of the rectangles represents the total strength of Ad-Dharmi and the Hindu depressed classes for which figures are available Appendix I to Chapter XI is a key to this map and gives the actual and proportionate figures for each unit of the Province It will be observed that the Ramdasia is put down as one of the Hindu depressed classes and in this connection it has only to be added that these persons returned themselves as Hindus by religion and Ramdasia by caste They are really Chamars and belong properly to the Hindu depressed classes. Those Ramdasias who returned themselves as Sikhs are not included in these figures.

* Mashabi, Marecha, Bengali, Perar, Barkar Bhangra, Chanal, Dosi (Doshi), Dhanak Gandhela, Gedri, Kolsi, Khatik, Kori, Nat, Pasi, Perna, Rihar Sapela and Sukhiand.
