Part I.—Brief Description of the Province.

23. The tract is physically speaking so broken and confused that it is impossible without going into great detail to separate it into parts each of which shall be even approximately homogeneous. The mountainous tracts of Hazára and of the Murree and Kahúta *tahsíls* of the Pindi district with their ample rainfall, and of the less favoured district of Kohát, cover an area of 6,520 square miles and contain a population of some 715,000 souls. Both Hazára and Kohát include large domains held by the semi-independent Nawábs of Tanáwal and Teri, who manage their own revenue and enjoy considerable powers of police and criminal jurisdiction, and with whom the Panjáb Government interferes but little, parts of their territories having never been visited by a European. The remainder of the tract has an area of about 14,500 square miles, and a population of some 2,209,000 souls. Except immediately under the hills, the rainfall, while quite sufficient in ordinary years, leaves little margin as protection against distress in unfavourable seasons; while save in Pesháwar and the riverain portions of Bannu irrigation is almost unknown.

24. Ethnography of the Salt Range Tract.—The population of the whole tract is almost entirely Musalmán, many of the very traders being Mahomedans in Pesháwar. The language is Pashtu in the trans-Indus and dialects of Panjábi in the cis-Indus portions of the tract. The people are chiefly Pathán in Pesháwar and Kohát, with a large admixture of menial classes of Hindu ancestry who, though now Musalmáns, are known under the generic name of Hindki. In Bannu the mass of the people consist of Pathán and the so-called Jats described above in § 21. The term Jat is little used beyond the Salt Range. In Hazára the Pathán villages are few, and confined to the bank of the Indus; but the centre and north of the tract are occupied by curious tribes, probably of Indian origin, but now by long association closely assimilated to the Afghán race, the principal of which are known as Jadún, Swáti and Tanáoli, and by Saiyads. In the south and south-west of Hazára and in the hills of Murree and Kahútá are found the Kahúts, Dhúnds, Sattis and Ketwáls, all claiming to be hill Rájpúts, together with Awáns, Karráls, Gakkhars, and numerous Gújars. The Salt Range is almost entirely in the possession of a tribe of mysterious origin called Awán, which has wrested the greater part of it from its original holders the Janjúha Rájpúts, and spread into Ráwalpindí, Hazárá, Pesháwar and Kohát, and in a less degree into Siálkot and Jahlam, and which, like all other non-Pathán, is merged in the comprehensive name of Jat as soon as the range crosses the Indus. In the less hilly portions of Ráwalpindi and Jahlam, Rájpúts, or tribes which claim Rájpút origin, with Awáns, Gakkhars, Khattars, and a few Gújars constitute the greater part of the population. Saiyads are numerous throughout the tract. In the city of Pesháwar itself is to be found a most extraordinarily cosmopolitan population, including representatives of almost every Mahomedan country east of Arabia.

25. With the exception of Pesháwar and Ráwalpindí, the tract includes no town of more than 20,000 inhabitants. But the whole trade with Central Asia and Kábul except the *pawindah* traffic of Derah Ismáil passes through Pesháwar, and the Salt Range supplies almost the whole of the salt used in the Panjáb. The silk and cotton fabrics of Pesháwar are the only manufactures of importance, and the mass of the population follows agricultural, and in the mountain ranges pastoral pursuits.

26. Summary of the above.—It will be convenient here to collect some figures regarding the tracts just described and to summarise their salient characters. The statistics given below in columns 6 to 11 are only approximate, as I have no figures for Native States, while those I have are for districts only and not for *tahsils*.

Part I.—Brief Description of the Province.

NOTES TO ABSTRACT No. 1

Tract I.—Himálayan.—The mountain tract of Kángra and the Hill States; with large rainfall and irrigation from hill-streams. Cultivation scattered and inferior. Population of rustic Hindu hillmen, chiefly Rájpúts and allied races, living in tiny hamlets; agricultural and pastoral. Language, hill dialects of Hindi. No large towns; trade and manufactures insignificant. Secure from famine.

Tract II.—Sub-montane.—Zone along the foot of the Himálayan. Ample rainfall and fertile soil. Large rural and agricultural population and no large towns. Secure from famine.

Tract III.—Eastern Plains (Northern).—Zone parallel to and south of Tract II. Considerable rainfall and fertilising hill streams. Soil fruitful and well-irrigation ample. Very populous and several large towns. Almost secure from famine.

Tract IV.—Eastern Plains (Eastern).—Zone along the Jamna. Rainfall fair, irrigated area large, and soil fertile. Large population and several large towns. For the most part in but little danger from famine.

Tract V.—Eastern Plains (Central).—Occupying the centre of the Eastern Plains. Soil and rainfall fairly good, and irrigation possible to north, east, and west; inferior and impossible in south. Population of average density; agricultural and in the south pastoral. Several large towns; liable to famine.

Tract VI.—Eastern Plains (Southern).—Bordering Bíkáner desert. Rainfall deficient; soil inferior; irrigation impossible. Scanty agricultural and pastoral population. Few large towns; very liable to famine.

Eastern Plains.—Tracts III, IV, V, VI.—Population chiefly Jats, Rájpúts, and allied races with menials. Religion Hindu in north, east, and south; Musalmán in north-west and south-west; Sikh in centre and to west. Language Hindi to east and south-east, Rájputána dialects to south-west, Panjábi in the remainder. Includes all the largest towns; and trade and manufactures flourish.

Tract VII.—Western Plains.—Comprises the mass of the Western Panjáb. Rainfall wholly inadequate. Cultivation chiefly confined to the immediate precincts of the rivers. Between them great grazing grounds, in parts covered with sand, and occasionally saline. Population scanty, largely pastoral, and partly nomad. Pathán and Bilochs on the frontier; elsewhere Jat, Rájpút, and allied tribes. Religion Musalmán. Language Pashtu and Bilochi across the Indus; Jatki to south-west; elsewhere Panjábi. Few large towns; little trade or manufacture. No famine possible, beyond distress from failure of grass.

Tract VIII.—Salt Range (Mountain).—Mountains of Hazára and Kohát, and the east of Rawalpindí. Rainfall ample; cultivation inferior. Scanty agricultural and pastoral population of Pathán and curious allied races, hill-Rájpúts, Awans, and Gújars. Religion Musalmán. Language Pashtu in Kohát; Panjábi dialects in Hazára. No large towns. For the most part secure from famine.

Tract IX.—Salt Range (Table-land).—Peshawar valley, Salt Range, and Table-lands of Bannu, Pindi, and Jahlam. Rainfall somewhat scanty. Irrigation hardly practised. Somewhat thinly peopled by Pathán on the west, Awáns to the south, and Rájpúts, Gakkhars and Khattars in the remainder. Language, cis-Indus Panjábi, trans-Indus Pashtu. Religion Musalmán. Few large towns. Trade and salt mining extensive. Liable to famine.

Part II.—Short Account of the Census Operations.

PART II.—SHORT ACCOUNT OF THE CENSUS OPERATIONS.

27. Previous enumerations of the people.—The present is the third Census that has been taken of the population of British Territory in the Panjáb, the people having been numbered on the 1st January 1855[1], on the 10th January 1868, and now on the 17th February 1881. In the Native States, on the other hand, nothing further than a more or less rough estimate of the population had ever been attempted before the present Census. I believe I am safe in saying that the present enumeration is more accurate than either of those which preceded it; and it is at least certain that the directions issued, the system followed, and the supervision exercised, were far more elaborate and descended to much greater minuteness of detail on the present than on any previous occasion. In 1855 no preliminary record was prepared, the enumeration being begun and ended on the night of the Census itself; while neither in 1855 nor in 1868 was any attempt made to record particulars separately for each person enumerated. On both these occasions the enumerator merely ascertained from the head of the house how many children, youths, and adults of each sex were sleeping under his roof, whether as members of the family or as visitors, the numbers thus ascertained were entered in the appropriate columns, and all members of the same family were assumed to have the same religion, caste, and occupation. It needs but small acquaintance with the people of the country to be able to appreciate the additional accuracy which has been attained by making a separate entry with name and full details for each individual. Moreover, at the present Census many particulars have been recorded to ascertain which no attempt had previously been made; and especially age, tribal sub-divisions, and occupations have been stated in much more minute detail than ever before. The classification of entries of caste and occupation was, in 1868, made in the district offices in accordance with brief instructions of a very general nature; and it is hardly possible that this work, which in the present Census I have found to be by far the most difficult and delicate part of the operations, should have been performed with as much uniformity as has attended the present classification.

28. General outline of the scheme of operations.—The scheme of operations of the present Census was based upon the recommendations of a Committee appointed by the Government of India in 1877-78 to consider the subject, largely modified in details by both the Imperial and the Local Government. The successive steps in the operations may be summarised as follows:—

(*a*) Division of the country into blocks, or units of enumeration.
(*b*) Preparation of lists of houses and families, and numbering of houses.
(*c*) Selection of agency.
(*d*) Preparation of a preliminary record of the population.
(*e*) The Census itself; or the correction of the preliminary record so as to bring it into accordance with facts as they stood on the Census night.
(*f*) The abstracting of the entries in the Census Schedules.
(*g*) The tabulation in detail of the figures thus abstracted.
(*h*) The compilation of the final Census tables from the figures thus tabulated in detail.

These various operations are described and discussed in detail in Book II of the present Report, and the exact meaning of each of the several units employed for Census purposes, such as the house, the family, the village, and the town, is there precisely defined. There too will be found a description of the difficulties we encountered with suggestions for their avoidance or abatement at a future Census, a discussion of the degree of accuracy which the results may be held to possess, and detailed information as to the attitude of the people towards the operations. It will be sufficient to give in this place such a general outline of the method of Census as may enable the reader to understand how the results presently to be discussed were arrived at.

29. Demarcation of Census blocks.—The first thing done was to split up the Province into blocks of such a size that a single man could conveniently visit all people living within any one of them on the Census night. In the hill tracts indeed this was impossible, nor was it necessary to divide off the uninhabited and inaccessible sides of Himálayan Mountains. In such places it sufficed to allot to each enumerator so many of the small scattered hamlets and isolated homesteads in which the hillmen live as he was able to deal with. So again, in the great arid pasture lands of the Western Plains men were told off to visit the camps of the nomad population, the exact position of which was ascertained from the tribal headmen a few days beforehand. But throughout the remaining portion of the Panjáb plains the whole area was divided off into blocks, and a separate enumerator made responsible for the enumeration of all persons found within the area of each on the night of the Census.

30. Numbering of houses.—The next step was to make rough sketch maps of the towns, villages, and hamlets, to prepare a list of the houses in each block and of the families in each house, and to paint up on the walls of the houses the serial numbers which distinguished them on the maps and in the lists. To any one unacquainted with Indian town and village life, and with the feeling of the people regarding privacy and the seclusion of women, it will be impossible to realise the difficulty experienced in answering the question—what is a house? In the hills and in parts of the western Panjáb the peasant often lives with his family in a separate house or hut built among his fields or by his well, or in one of a small group of such separate houses which lie close together and constitute a hamlet. In such cases the matter is simple enough. But the ground-plan of an ordinary Panjáb village in the plains is often not unlike one of those mazes with which the ingenuous English youth who believes in Fair Rosamond is wont to delight himself. It is surrounded by a ditch and mud wall, and entered by one, two, or three gates

[1] The corresponding Census of the Dehli Territory, namely Dehli, Gurgáon, part of Karnál, Hissár, and Rohtak, was taken under the North-Western Provinces Government on 1st January 1853; while the Census of Bhattiána or Sirsa was a settlement Census, taken village by village between 1852 and 1863.

Part IV.—Distribution among Houses and Families.

be smaller, and not larger, than the number of families, and should therefore give a larger average number of souls, yet if unoccupied buildings were included—and there is nothing in either the instructions or the tables of 1868 to show how they were treated—the average number would be very largely reduced. I have already noticed that the number of souls per house has decreased in each successive Census; and combining the two sets of figures, we find that the number of families per house has also decreased as follows:—1855, 2·20; 1868, 1·55; 1881, 1·52. It is just possible that, as it becomes more and more the custom for a family when separating to move to a separate house, there is a tendency to put off the period of separation. But, as already explained, I do not think the comparison of the figures for houses has much meaning; and I do not believe that the average size of the family is really increasing. It is not only opposed to the general tendency to greater and greater separation of interests to which I have already alluded, but it is also opposed to the experience of all the officers who notice the subject. Thus Mr. Kensington of Hoshyárpur writes, and several other officers note the same tendency:—

"Under our rule it is getting very uncommon for large families to remain undivided. In less orderly times they lived together "for mutual protection, and unity was found to be strength. Strength is now less in demand. Under growing security the family "tie is giving way in the struggle for individual independence."

I believe that this is the natural course of events. I would only add that the family has probably already nearly reached its ultimate limits in the Panjáb, for our average of 4·56 souls only allows five children to every two married couples, assuming a husband and wife to start with in each family.

Part I.—Historical Retrospect.

CHAPTER III.

FLUCTUATIONS OF POPULATION.

PART I.—HISTORICAL RETROSPECT.

114. General rate of increase of population[1].—The population of Panjáb British Territory—for till 1881 no Census had been taken in Native States—stood as shown in the margin at the three enumerations made in 1855[2], 1868, and 1881, the corresponding proportional figures per mille being given below the actual numbers so as to show the rate of increase. Thus it appears that the population has increased by 24·3 per cent. since 1855. But within the last 13 years of that period the increase has been only 7·1 per cent., while the corresponding increase during the equal interval which elapsed between the two first enumerations was 16·1 per cent., or considerably more than double that rate. The figures in the margin show the annual rate of increase of population for the principal Indian provinces and civilised countries, roughly calculated for purposes of comparison[3]. On the whole, the rate of increase of population in the Panjáb is not nearly so large as might have been expected in a Province not long ago rescued from something very like anarchy and brought under a civilised rule. In a country whose recent history, both physical and political, has been so varied as has been that of the Panjáb, the fluctuations and composition of its population can only be explained by reference to that history. Nothing of the nature of a historical retrospect was attempted in the report on the last Census; and I shall be excused if I briefly sketch the most prominent events which have in recent times affected the life of the people. A new generation of Englishmen now administer the Province; order is as unbroken and security of life and property as perfect as in the parts of India which have been longest under our rule; and it is not easy to realise that there are still five million persons alive in the Panjáb who might remember Ranjit Singh, or who were at any rate alive when he died, that seven millions, or nearly one-third of our population, were born under Sikh rule, and that old men still survive who have heard their fathers tell as eye-witnesses "strange stories of Nádir Sháh and his nameless deeds." We know that Ranjit Singh was a mighty monarch, we have heard of the iron sway of Sáwan Mal, and we find it difficult to conceive the true nature of the rule which was replaced by our own, and of the state of the country when it fell into our hands. [When I wrote Part I of this Chapter, I intended to discuss the detailed figures for migration and increase with reference to the previous history of the several districts on the lines indicated in note (3) to section 180, and in sections 181, 2, 3, 4. But before the Chapter was finished, the orders of Government limiting the time for the completion of the report were received, and I was compelled to abandon my intention. As Part I appears to me both interesting and useful, I print it as it stands, especially as some portions of it are referred to in the subsequent parts of the Chapter,

Year of Census.	Persons.		Males.		Females.	
1855	15,161,321		8,357,786		6,803,535	
1868	17,609,518		9,594,308		8,015,210

[1] The subject of this chapter naturally falls under two main heads, the fluctuations owing to the movements to and fro of the people, and the increase and decrease owing to births and deaths. These two matters are discussed in the subsequent parts of the chapter, and prefixed to each part will be found a discussion of the nature and accuracy of the figures with which it deals.

[2] See remarks on the figures of 1855 in the footnote to Section 87. The details of sex in the Sirsa district for 1855 are estimated by applying the proportion of the sexes for 1868 to the total population of the Settlement Census.

[3] The rates, other than those for the Panjáb, have been got by dividing the percentage of total increase by the number of years during which that increase took place. This gives too high a figure; but as the interval between the two enumerations is small, the *relative* magnitude of the figures is not affected for practical purposes of comparison.

Part I.—Historical Retrospect.

and I have no time to rewrite and condense it. But I add this explanation, without which it would appear somewhat irrelevant to the scope of the Report.]

115. The Panjab during the 18th century.—The first half of the 18th century was one of unusual turmoil even for India; and as has ever been the case when fighting is going on, the Panjáb was in the very heart of the fray. As the century opened, the Sikhs, rapidly growing into importance as a military organisation, but as yet possessed of no national spirit to restrain their excesses, thirsting for revenge for the persecutions of the bigoted Aurangzeb and for the murder of the helpless family of their great Guru Govind, and prompt to profit by the dissensions which followed on the death of Bahádur Sháh, ravaged the whole eastern portion of the Province from the Jamna to the Satluj, and laid the northern and central tracts under contribution. The invasion of the great Persian freebooter Nádir Sháh followed close upon their punishment, and swept like a wave of death through the Panjáb, ravaging and destroying all that lay in its course. And the first half of the century was fitly closed by the famines of 1753 and 1759.

116. The latter half of the same century witnessed one continuous struggle between the Mahrattas in the east, the Durránis in the west, and the Sikhs in the centre, for the possession of the Panjáb plains, varied only by the rise and fall of petty marauding chiefs of every country under an Indian heaven, Rájpúts, Mughals, Jats, Biloches, Patháns, even Frenchmen and Englishmen, who saw in the decay of the Mughal empire and the universal anarchy which prevailed, an opportunity to rise to power and to amass wealth by war and rapine. Eight times within twice as many years did Ahmad Sháh invade the Panjáb; eight times had he to fight his way through the Sikh armies which sprang up on his path like Jason's foes; eight times was his departure from the Province the signal for the Sikhs and Mahrattas to fly at each other's throats; until even he gave up the struggle in despair, and left the Sikh *misls* to extend their conquests, always by hard fighting, till they were masters of the whole of the Panjáb from the Jamna to the Indus and from Kángra and Jammu to Hánsi and Multán, and, having won them, to quarrel over their possessions. The desolation which Ahmad Sháh's army carried in its route is expressed by the saying still current among the wild tribes of Montgomery: "What one eats and drinks is one's own; the rest is Ahmad Sháh's." During the intervals between his incursions the Mahrattas overran the country and took Multán and Lahore, and were presently followed by the Bhangi Sikhs—

"whose raids and cruelty live to this day in the memory of the peasants of Muzaffargarh." Meanwhile, "various men of in-"fluence made themselves independent, and exercised all the privileges of independent rulers as regards fighting with each other, and "robbing and murdering those weaker than themselves. Might was the only test of right, and in the absence of any general control-"ling authority the country became a prey to the ambition of rival chiefs struggling for supremacy."

It is impossible to open a history of any part of the Panjáb during these terrible fifty years, without finding every page occupied by one continuous story of war and bloodshed. The whole Province was in arms. Almost every considerable village or small town had its local chief, with a band of followers ready to fight for plunder or power; and the incessant turmoil in which these gentry kept the country was interrupted only when they united against a common enemy from without.

117. In the midst of all this misery came the "great famine," as the people still call it, of 1783.

In the east of the Panjáb "the country was depopulated, the peasants abandoning their villages and dying in thousands of "disease and want; the country swarmed with bands of thieves and highway robbers, and the state of anarchy was almost incon-"ceivable." (*Griffin's Panjáb Rájas*). In the fertile and populous central districts "wheat sold at from 1½ to 2½ seers for the "rupee, the people fled to Hindustán, Kashmír, and Pesháwar, the seeds of the acacia and the cotton plant were greedily devoured, "so many died of starvation that bodies were thrown into the wells unburied, mothers cast their children into the rivers, and even "cannibalism is said to have been resorted to. The cattle nearly all died, or were eaten up by the starving Mahomedans. Many "ruins of old villages are traceable to this famine; and stories are still told of the extraordinary friendships which grew up among "the survivors, who clung together, sharing with each other everything available as food. The famine was followed by great "mortality from fever and ague, and a large proportion of those who had escaped starvation fell victim to disease." (*Saunders and Waterfield—Lahore and Gújrát Reports.*) Even in Hazára, which has escaped untouched by the many droughts which have since devastated the Panjáb, "this famine fell with terrible severity. Grain sold at 3½ to 4½ seers per rupee, and was not to be had "even at that price when the famine was at its height; and popular accounts describe the district as nearly depopulated." (*Wace.*)

118. The Panjab from 1800 A.D. to annexation.—With the beginning of the present century the eastern parts of the Province found rest, at least from external troubles. In 1803 the treaty of Sirji Anjangám made us masters of the Dehli and Hissár divisions; and in 1808 we confined the rising ambition of Ranjít Singh to the country west of the Satluj, and took the States of the Eastern Plains, with the exception of Kapúrthala, under our protection. The country immediately to the west of the Satluj also enjoyed comparative political peace, for the supremacy of Ranjít Singh was practically absolute. But on the border he gradually reduced to nominal subjection the tribes of the trans-Indus frontier, who had ever been impatient of the yoke, even when imposed by one of their own race and religion; while in the hills he fought with the Gúrkhas over the spoils of the ancient Rájpút kingdoms. During the first forty years of the century six famines of greater or less severity occurred, in 1802, 1812, 1817, 1824, 1833, and 1837. Those of 1802, 1817, 1824, and 1837 were less fatal and less general than those of 1812 and 1833, and were apparently confined to the east of the Province, where in 1841 an epidemic of fever reached such a height that "the crops died standing for want of people to cut them," and was succeeded in the following year by a drought of considerable severity. The famine of 1833 was almost equal in severity to that of 1783.

In the eastern and south-eastern districts "it forms the epoch from which old men fix the dates of events. In many villages no "land was even ploughed up, in but few was any seed sown, in none was a crop reaped. What little grass sprang up was eaten "by locusts. The cattle died, wheat rose to 8 seers per rupee, and the people followed their cattle; while crowds of emigrants from "the highlands to the west poured into the district to help the residents to starve" (*Karnál Report*). The people of Rohtak say of this famine:—"The shop-keeper hid in his house, the child wept over its meal" (*Fanshawe*). In the central districts the distress was not so severe, but "famine raged in Kashmír, and a great influx of people was the result, most of them only to die; "many came to sell their children who are still (1870) to be found in the houses of the prostitutes." (*Waterfield's Gújrát Report.*)

Six years of anarchy which succeeded the death of Ranjít Singh were terminated by the bloody war with ourselves; and so the Panjáb passed under English rule. What the state of the country was when it came into our hands, and what the nature of the rule which was superseded by our own, I shall now endeavour to indicate.

Part II.—Migrations of the People.

Our net gain from each State is shown in the margin. The States which march with us are as follow... *Jaisalmer* with Baháwalpur, *Bíkáner* with Baháwalpur, S... and Hissár, *Jaipur* with Hissár, Loháru, Patiála, and Gurgáo... *Alwar* with Patiála, Nábha, and Gurgáon, and *Bhartpur* with Gurgáon.

States.	Net gain.
Bíkaner	80,380
Jaipur	42,862
Alwar	3,596
Bhartpur	6,556
Jodhpur	3,210
Jaisalmer	3,241
Other and unspecified States	12,477
Total	151,832

148. The immigration is enormous as compared with the emigration, being four times as great among the males and two and a quarter times as great among the females, a disproportion which shows how far more permanent in its nature is the immigration than the emigration, and that much of the latter is probably reciprocal emigration which has followed as a matter of course upon the permanent immigration which preceded it, the new settlers looking to their old homes in search of brides. This of course is not the case in the more distant States where such emigration must necessarily be limited, and where, accordingly, the proportion of males is more than twice the average for the whole emigration. This preponderance of immigration is not to be wondered at. As the Panjáb Government remarked after reviewing our system of land revenue assessment in the Administration Report for 1872-73: "The result is that there is a very striking difference in the land revenue demand in British territory on the one hand, and in the territory of adjoining Native States on the other;" and of all the Native States of Northern India those of Rájpútána are probably the most backward in both physical and administrative development. In Bíkáner especially, the Bágar or tract adjoining our border is a rolling prairie of sandy soil covered by scanty grass and with an eminently precarious rainfall, and the agriculture is so primitive that the people have not yet risen to the conception of growing two crops in the same year, the autumn crop alone being cultivated, though the custom of sowing spring staples is gradually spreading southwards from our territories. The immigration from Bíkáner is chiefly into the adjoining districts of Hissár and Sirsa, and an account of it will be found in the postscript to this chapter. The moderate percentage of males shows that it is of the permanent type. From Jaipur the migration is chiefly into Hissár and Patiála: the figures for the former district are obscured by the much larger immigration from Bíkáner, but the immigration into Patiála seems to be chiefly of the reciprocal type. The migration from and to Alwar are almost exactly balanced: the exchange is chiefly with Gurgáon, and the large number of females show it to have been chiefly of the reciprocal form, though I fear that the figures mean more than that, and that the large number of females, not only among immigrants but throughout the Gurgáon population, is partly due to actual mortality among the males during the terrible distress which has prevailed of late years in this district. The same remarks apply to Bhartpur, save that here immigration is largely in excess of emigration. To Jaisalmer there is no emigration, while the immigrants have settled for the most part in Baháwalpur, the only portion of the Panjáb which marches with it.

District or State.	Percentage of total immigrants from Rájpútána living in the District or State.	Percentage of total population who are immigrants from Rájpútána.	Number of males among every 100 immigrants of both sexes.
Dehli	7·71	2·80	55·2
Gurgáon	20·26	7·37	33·0
Hissár	24·11	11·17	67·2
Rohtak	3·94	1·66	40·9
Sirsa	19·62	18·10	54·7
Patiála	8·83	1·40	29·4
Nabha	2·38	2·11	25·6
Jhind	2·38	2·21	42·4
Baháwalpur	4·50	1·83	57·2
Total	93·73	...	...

I show in the margin the distribution of the immigration from Rájpútána, and the proportion which the immigrants form of the total population of each district. The figures of Abstract No. 26 on the opposite page show that, excepting the great commercial centre of Dehli, the immigration has, like all permanent immigration, chiefly gone to swell the rural population.

149. Migration to and from the North-West Provinces.—Still moving round our border we next come to the North-West Provinces. Here again separate figures are given for the North-West and Oudh in columns 95 and 96 of Table XI; but, as already explained in the case of Bombay and Sindh, it is not safe to take them separately, and all that can be said is that the persons shown in column 96 were born in Oudh and not in the North-West proper. And here we have a most striking example of the distinction which I have insisted on between reciprocal migration on the one hand, and temporary or permanent on the other. Oudh nowhere marches with the Panjáb, while of our own districts, Ambála, Karnál, Dehli, and Gurgáon alone have a common border with the North-West. The distance of our several divisions from the neighbouring Province increases, speaking roughly, in the order in which they are arranged in our tables. I show in the margin the number of males per 1,000 immigrants of both sexes from Oudh and the North-West into the Panjáb, and from the North-West into the abovementioned districts and into each division.

Oudh	719	Hissár Division	525
North-West	518	Ambála ,,	607
Gurgáon	306	Jálandhar ,,	691
Karnal	398	Amritsar ,,	612
Dehli	417	Lahore ,,	673
Ambála	546	Ráwalpindi ,,	751
Other districts	681	Multán ,,	679
		Derajat ,,	806
Dehli Division	388	Pesháwar ,,	826

The fact is that when we once leave the neighbourhood of the Jamna, a very large portion indeed of the immigrants from the North-West consist of what we call in the Panjáb *Púrbias*, or low-caste men, mostly I believe Chamárs and Jaiswáras, who have come into the Province as camp-followers with troops from down-country, many of them probably when the Panjáb was first occupied. Many of these men have settled down permanently; and at places where there has once been a large cantonment, as at Karnál, will still be found in considerable numbers. But many of them follow the troops from one cantonment to another, or find other employment. In the east of the Panjáb the stable servants are Púrbias almost as a matter of course. The figures of Table VI show how, outside the Dehli division, these immigrants from the North-West are almost confined to districts in which troops other than the Panjáb Frontier Force are cantoned. Many of the gangs of navvies, Ods, and the like, who wander in search of employment on earthwork through the length and breadth of the Province also hail from the North-West. But the mass of the immigration into the Dehli division, Ambála, and Rohtak, which districts include 57 per cent. of the whole, is reciprocal, as is shown by the sex-figures quoted above: though in Ambála and Dehli the presence of cantonments, and in the latter the attractions of a great centre of trade, have doubtless caused a great deal of immigration of both the permanent and temporary types.

NOTE.—For the method of reading this table see foot-note to Abstract No. 24, page 64.

Part II.—Migrations of the People.

150. I have not taken out separate figures for towns and villages for each of the Provinces from which immigration has taken place into the Panjáb, but Abstract No. 26 on the preceding page, which is compiled from Table XI and Supplementary Table E, shows the general character of the immigration with sufficient clearness.

District or State.	Percentage of total immigrants from the N.-W. P. & Oudh living in the District or State.	Percentage of total population who are immigrants from the N.-W. P. & Oudh.	Number of males among every 100 immigrants of both sexes.
Dehli	20·24	8·21	42·4
Gurgáon	11·09	4·87	30·7
Karnál	9·83	4·13	40·5
Rohtak	2·59	1·22	47·6
Ambála	12·05	2·94	58·3
Simla	2·73	16·58	71·6
Jálandhar	1·34	0·44	64·1
Amritsar	2·77	0·81	56·1
Siálkot	2·14	0·55	65·6
Lahore	5·57	1·57	69·3
Firozpur	3·14	1·26	65·2
Ráwalpindi	5·72	1·81	74·9
Multán	2·85	1·35	68·8
Pesháwar	3·30	1·49	80·8
Patiála	1·01	0·29	61·8
TOTAL	87·96	...	...

The districts are divided into groups according to the countries from which immigration is largest. The immigrants from Rájpútána have already been shown, and those from Kashmír will presently be shown to be almost wholly resident in the villages, and deducting them, the disposal of the immigrants from the North-West Provinces can be examined. It will be seen that in the eastern districts which lie on the border of those Provinces, the immigrants have largely been found among the rural population, though less markedly so where great cities or cantonments exist such as Dehli or Ambála; and that this is the case still more among females than among males. In the districts which lie further west on the other hand, the great mass of immigrants of both sexes are to be found in the towns.

The distribution of the immigrants from the North-West Provinces and Oudh is shown in the margin.

Districts.	Emigrants.	Immigrants.
Dehli	42,000	52,818
Gurgáon	35,000	31,274
Karnal	24,000	25,058
Ambála	18,000	31,443

The emigration from the four border districts into the North-Western Provinces has been roughly estimated (see section 154) and the results are given above.

151. Immigration from Kashmir.—The only considerable source of immigration left to be examined is Kashmír, the figures for which will be found in column 103 of Table XI. Till the late famine, when Government insisted upon the prohibition being removed, all emigration from Kashmír was forbidden by the Mahárája, and precautions were taken to prevent it. But these precautions were only effective as regards the valley itself, as the Jammu border could not be watched. The state of affairs in Kashmír, even in ordinary years, may be judged of from the following account of what happened in the late famine, taken from the Panjáb Administration Report of 1878-79. It must be remembered that two-thirds of the inhabitants are Musalmáns, while the whole official staff is Hindu.

"In Kashmir the sale of grain is a State monopoly. In the greater part of the valley the cultivator pays in kind; and although "the share of the State is nominally only one-half, yet the amount of fees, fines, and perquisites is such that the cultivator is fortunate "if he receive one-fourth, or even one-fifth of the produce of his fields. The officials, generally in arrears of pay, and their chance "of Court favour being dependent upon the amount of their collections, find it their interest to squeeze from the cultivator every- "thing that can be taken from him; and the occurrence of scarcity or famine does not induce them to diminish their demands, so "that the cultivator obtains less of the produce at the very time when a larger proportion is necessary to save him and his family "from starvation. The sale of grain being a State monopoly, all private enterprise in the matter of importation is impossible. The "price of grain is kept down, even in times of famine, to so low a rate that importation from the Panjáb would not be profitable, as "prices probably there range higher than in the valley. But those low rates merely signify that the poverty of the population is "so extreme that higher prices would be starvation, while, there being no competition between the State and private sellers, the rate "decided by the Darbar is purely arbitrary, and no measure of the natural value of food. During the worst part of the present "famine prices have been lower in Kashmir than in the Panjáb; but this fact has had no effect whatever on the mortality, seeing "that the price was an arbitrary one, merely representing the rate at which the Government would have sold grain had it possessed "it to sell. But the grain-supply being altogether insufficient for the wants of the population, the people would have equally died by "starvation had they possessed abundance of money wherewith to purchase.

"The official reports which reached the Government, those furnished by missionaries labouring in Srinagar, and by private "visitors to the valley, were all unanimous as to the gross corruption which prevailed in all classes of official society. The "distribution of grain ordered by the Maharaja was not made, or was made inequitably, the poorer Mahomedan classes being unable "to obtain sufficient to maintain life, while the richer Pandit and official classes were allowed to embezzle enormous quantities, "reducing the general stock, and reaping large profits for themselves. The measures of relief undertaken by the Panjáb Government, "at the request and at the cost of the Maharaja, were obstructed by the officials, who did not approve of any possible "profits falling into the hands of others than themselves. The direct orders of the Maharaja, often reiterated, to give assistance in "every possible way, were evaded; and although a large quantity of Panjáb grain did eventually reach the valley, it was rather in "spite of, than in consequence of the assistance rendered by the Darbar officials.

"The prospects for Kashmir are still most gloomy. The recent harvests, though an improvement upon those of the preceding "year, have still been scanty owing to the unfavourable weather, and the fact that the cultivators were compelled to eat the seed "grain to preserve themselves from starvation, while the population were too exhausted, and too apathetic, from continued misery, "to cultivate their fields. The loss of life has, however, been so great that it may be hoped that the existing food-supply will be "sufficient for the reduced population, if the Kashmir Darbar insists upon cultivators receiving their proper share. It will be long "before Kashmir recovers its former prosperity."

152. Such being the nature of the Kashmír administration there is a constant tendency to emigrate into the Panjáb, while in famine years crowds of immigrants pour with their whole families into our territories. The Kashmír colonies at Amritsar and Lúdhiána are, I believe, for the most part descendants of famine-stricken fugitives who settled there in the terrible famine of 1783; while in 1833, and again in 1877-78, the immigration is specially alluded to in the reports as having seriously increased our administrative difficulties in the districts bordering upon Kashmír.

District.	Percentage of total immigrants from Kashmir living in the district.	Percentage of total population who are immigrants from Kashmir.	Number of males among every 100 immigrants of both sexes.
Kangra	2·50	0·39	52·9

TOTAL	94·82	...	...

The figures in the margin give the distribution of immigration within the present generation. The large proportion of females in the districts which border on Kashmír territory would seem to indicate that much of the immigration is reciprocal. A portion of it perhaps is so; but I suspect the real explanation to be that the immigration is not merely one of individuals in search of work or food, but a wholesale emigration of entire

Part II.—Migrations of the People.

families fleeing from oppression and starvation; and that the men went on to Amritsar where they had friends, and to Ráwalpindi, Jahlam, and Pesháwar where labour was in demand on public works and in the transport camps, leaving their women and children behind in the districts to which they first came when they crossed the border. The figures of Abstract No. 26 on page 67, show how very much larger a proportion even of the male immigrants from Kashmir are to be found in the villages than in the towns, especially of those districts nearest to the border; while the females are almost wholly found among the rural population.

153. Figures for intra-provincial details.—I now turn to migration within the Province—or, to use more exact language, to the intra-provincial details of migration. I propose to discuss the direction and amount of migration to and from the various districts and states. But to do this with any approach to accuracy, we cannot altogether neglect emigration beyond the limits of the Province. Now we know the exact number of people (see Abstract No. 23), who have emigrated from the Panjáb to each of the other Indian Provinces; but unfortunately we do not know from what part of the Panjáb they have come. Some sort of estimate therefore becomes necessary. Emigration to countries beyond the Indian empire may, as I have already pointed out, be neglected; and the emigration to Provinces which do not march with the Panjáb is so small in extent, and probably so much distributed over the several districts, that it is not necessary to take it into account. But where other Provinces march with ours, and especially in the east where reciprocal migration is extensive, it is necessary to form an estimate of the emigration from each district across our frontier. It would be absurd to compare the emigration from Rohtak to the districts which surround it on all sides with that from Dehli, if we excluded from the latter the movement across nearly half its border where it marches with the North-West Provinces. I have therefore framed a rough estimate of the numbers of each sex who may be supposed to have emigrated from the several border districts to the Provinces upon which they touch, and this estimated emigration has been included in the figures I shall presently discuss. It is necessary that it should be known, for the purposes of the next Census report, if for no other, how I have arrived at my estimate; and I therefore give details below in small type. The figures for intra-provincial migration are contained in the following tables. Table XI, Appendices A and B, shows the distribution by birth-place of the population of each district and state in the Province, and consequently the distribution by residence of the immigrants from each state, district, province, and country, whether within or beyond the Panjáb. Supplementary Table F, Appendix C, shows gain or loss by migration in each district. Supplementary Tables G and H show the movements of the population from district to district, while Supplementary Tables C, D, and E give details of birth-place.

154. North-West Provinces.—See the discussion on the migration from those provinces in sections 140, 150 above. The North-West Provinces Census tables give us figures for total emigration from the Panjáb; but unfortunately give no details of the districts in which those emigrants are to be found. Such details would have rendered the estimate easy and certain. It is probable that there is but little emigration from the Panjáb to balance the immigration of camp-followers and the like, as the conditions which have caused this immigration act in one direction only; that the greater part of the emigration has taken place from the four districts which march with the North-West; and that these districts have furnished a larger proportion of the female than of the male emigrants, as the migration will have been to a great extent reciprocal. The figures which the North-West Provinces tables give for immigration from "other parts of India" into their several districts tend to support this conclusion. The total immigration from the North-West Provinces into the four border districts is males 53,183; females 76,667. The total emigration from Panjáb British Territory into the North-West Provinces is males 67,303; females 72,499.

Assuming that 80 per cent. of the male and 90 per cent. of the female emigrants go from the four districts, and distributing this portion of the emigration among them in proportion to the female immigration into each, that being the best standard of reciprocal migration—first, however, reducing the female immigration into Dehli by 10 per cent. to allow for the tendency which a large town has to attract immigrants—we get the results given in the margin as rough figures for the emigration from our four districts into the North-West Provinces.

Districts.	Males.	Females.
Dehli	19,000	27,005
Gurgáon	16,000	19,096
Karnal	11,600	13,000
Ambála	8,000	10,000
Total	54,000	69,000

Rajputana.—In the case of Rájpútána we have unfortunately no figures for emigration to Bíkáner or Jodhpur, the former of which sends us some two-fifths of the whole immigrants from Rájpútána. For the remaining States we have exact figures for total emigration from the Panjáb and for details of immigration into each district (see Abstract No. 25, page 65). All therefore that is needed is, to distribute the emigration in proportion to the immigration and neglect small figures. As for Bíkáner, the migration is chiefly into Hissár and Sirsa, which are emphatically attracting immigration. Such return emigration as takes place is almost certainly small, and probably consists largely of women marrying in the country of their fathers. I roughly estimate the emigration to Bíkáner as 4,500 males and 7,500 females, or 12,000 in all, of which I assume 7,000 to go from Hissár, 3,000 from Sirsa, and 2,000 from Bahá walpur. The whole population of Bíkáner is only 509,000 and my estimate is probably too high. I estimate the emigration into Jodhpur at 2,500 in all. Thus, neglecting small numbers we get the following estimate for emigration from Panjáb districts and states into Rájpútána.

Panjab District.	Bikaner.		Jaipur.		Alwar.		Bhartpur.		Total.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Dehli	...	...	700	1,300	1,300	3,200	1,300	1,700	3,300	6,200
Gurgáon	...	...	750	1,400	7,500	16,500	4,500	6,000	12,750	23,900
Hissár	2,500	4,500	1,500	2,800	...	...	...	...	4,000	7,300
Sirsa	1,000	2,000	...	...	...	...	...	...	1,000	2,000
Patiala	...	...	1,500	2,800	1,000	1,600	...	...	2,500	4,400
Bahá walpur	1,000	1,000	...	...	...	...	...	...	1,000	1,000
Total	4,500	7,500	4,450	8,300	9,800	21,300	5,800	7,700	24,550	44,800

Bombay and Sindh.—See the discussion in sections 145, 146 above. The emigration into Bombay proper is largely to the city of Bombay itself and is probably, like the immigration from Bombay, chiefly mercantile and drawn from all parts of the Panjáb. It may therefore be neglected. Sindh takes 13,686 males and 3,804 females from British Territory, and 6,898 males and 4,928 females from Native States. It is probable that the emigration from British Territory is chiefly connected with Railway works, and consists largely of coolies. It is quite impossible to frame any estimate of the degree in which it is derived from the several parts of the Panjáb, and, though large in amount, I am compelled to neglect it. Of the emigration from Native States it is almost certain that a very large proportion comes from Bahá walpur, the only State which is near the Sindh frontier. I estimate the emigration from Bahá walpur into Sindh at 4,000 males and 3,000 females, which is almost certainly under the mark.

Emigration from British Territory and Native States.—It was further necessary for the purpose of my abstracts and supplementary tables to distribute the total emigration between Native States and British Territory. The figures given at the foot

Part II.—Migrations of the People.

thousands across the border of neighbouring districts, and reduces the indigenous proportion of females below that of males, more especially in the Jamna tract. The river which separates us from the North-West Provinces presents no formidable obstacle to such migration, and the movement of population across the border is considerable. But the North-West Provinces have also sent us a very considerable number of immigrants who have accompanied our troops as camp-followers to the furthest limits of the Province, and have there settled down as the well-known Púrbia population of our cantonment bazaars.

174. Thus the Panjáb, fast developing under strong and settled rule, has attracted to itself population from the countries that surround it on all four sides. To the inhabitants of the crowded districts of the Ganges Doáb it has offered land no less fertile than their own, and more plentiful in proportion to the people to be fed. To the people of Rájpútána it has held out the attractions of a higher rainfall and more ample and easy irrigation. The wild tribes of the frontier have found in the Indus Valley pastures where they and their herds are secure from attack; while the people of Kashmír have sought in British territory that help in time of need which was denied them by their own Government. To the north and west the movement has been almost wholly in one direction; but on our eastern and southern borders the immigrants have retained their connection with their original homes, and more especially have looked for wives for their sons and husbands for their daughters from among their fathers' people, and a considerable reflex movement has resulted.

175. The only portion of the Province where real pressure of population is felt is that which includes or lies immediately under the lower hills, and there the denudation of the hill sides and the constantly increasing damage done by the hill-torrents are yearly making the pressure more and more severe. The parallel zone to the south of it, which combines a fertile soil with facilities for irrigation in perhaps a higher degree than any other part of the Panjáb, has hitherto received the surplus population, while the construction of the Bári Doáb Canal and the Fírozpur irrigation works have greatly facilitated the transfer. And now that the capacity of that fertile zone to receive the surplus numbers of other parts has been taxed to the utmost, and it possesses as dense a population as it is able to support, the Sarhind Canal is about to irrigate the central plains, and so to open a wide outlet by which the pressure of population to their north may find relief. Further to the west the projected canal from the Chanáb into the Gújránwála *bár* will perform a similar office for the sub-montane districts of that part of our border; and when these two works are complete, all fear of over-crowding which cannot be relieved by migration to that moderate distance which alone the Panjáb peasant cares to undertake, will be removed at least for many years. Meanwhile the people are steadily moving to the large cities in ever increasing numbers, while the villagers are slowly spreading their habitations over the fields which it is their task to cultivate, and thus the conditions of both urban and rural life are tending, very slowly indeed, to approach more nearly to those which obtain in England. The development of the Province under British rule and the peace and order which have accompanied it have rendered possible the movements I have described. The facilities now afforded for safe and easy locomotion enable surplus hands to leave the over-crowded rural tracts for the centres of commerce or the sites of large engineering works; while the settler in a strange country is now secure of his life and property. Above all the great irrigation works executed by us have extended the area and raised the standard of cultivation in the great plains of the Province; our railways, by connecting them with the markets of Europe, have raised the demand for their produce; and thus have been afforded certain means of subsistence to the increasing population which under our rule is no longer wasted by war or decimated by famine.

				Asia	1,000	1,000	1,000	998	999	999	999	1,000	999

DEHLI.—The amount of immigration is exceedingly large in proportion to the population. The attractions exercised by a great centre of commerce swells its amount; but the low percentage of males, and the fact that, the proportion of people born in the district, and even in the Panjab, is smaller among females than among males, show how largely the migration, at any rate between Dehli and the districts and provinces which border on it, is reciprocal. The percentage of males is highest in Hissar, Ambala, Lahore, and the Native States, none of which march with Dehli. It is also high among the immigrants from Rajputana, which would seem to show that some of them had been driven to the river banks by scarcity of water and grass, or were perhaps engaged on the works of the new canal. Males are more numerous among immigrants than among emigrants, the immigration to a large urban centre always showing an excess of males. The excess emigration to Lahore and Ambala is probably due to the attractions exercised by the provincial capital and the cantonments. Among the districts with which exchange has been considerable, the emigration has been largest in proportion to immigration in those where density of population is smallest. But the fertility of the riverain and canal-watered tracts of Dehli has caused immigration from largely to exceed emigration into the neighbouring districts, except in the case of Karnal which offers identical attractions; though the extensive emigration into Rohtak is probably due, in part at least, to the ravages of saline efflorescence in many of the canal villages.

GURGAON.—Here again the migration is largely reciprocal, the figures presenting the same features in this respect which characterise those for Dehli. But much of the emigration is probably due to the terrible scarcity and distress from which Gurgaon has suffered for the last five years, as is shown by the fact that the proportion of males is much larger among emigrants than among immigrants. The same reason no doubt accounts very largely for the excess of emigrants over immigrants, except in the case of the neighbouring Rajputana States for which the figures are only estimates, and for the Native States where nearly three-quarters of the migration consists of females.

				Asia	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000

KARNAL.—Here again the migration is largely reciprocal, while the attraction exercised by the riverain and canal tracts has caused the immigration largely to exceed the emigration, both being almost wholly confined to tracts which march with the district, and immigration being mostin excess from those districts which have the smallest common frontier. The percentage of males is always larger among emigrants than among immigrants, which seems to point to the immigration being more largely of the permanent type than is the emigration. The extensive emigration into Rohtak and the Native States is largely due to the havoc caused by saline efflorescence in parts of the canal tract.

				Asia	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000

HISSAR.—The only tracts besides Rohtak which march with Hissar are the Native States, Rajputana, and Sirsa. From the two first it has received a large surplus of population, which is a natural result of the introduction of canal irrigation and the great development of the Hissar district under our rule. The Sirsa district, however, has practically been populated since we received it, and here the movement of population has been in the other direction. Hissar lies between the fertile districts of Karnal and Rohtak on the east and the far less fertile Native States and Rajputana on the other three sides, and it has given to the former and taken from the latter. The low proportion of males shows that the migration in the case of Rohtak and Karnál is chiefly reciprocal. The same test shows that the emigration, except to Sirsa, is largely of the same type. The moderate proportion of males (neither as high as in temporary nor as low as in reciprocal migration) among the immigrants from Sirsa, the Native States, and Rajputana and the emigrants to Sirsa, shows how largely these movements are permanent. A part of the movement eastwards was probably due to drought which drove the cattle towards the river and canal in search of pasture.

ROHTAK.—Here the migration is very largely reciprocal in every case, though least so in the case of Rajputana. Rohtak occupies an intermediate position between the fertile Jamna tract and the far less fertile districts and states to its west and north. It gives to the former and takes from the latter, though in the case of Gurgaon the distress which has lately prevailed there has caused immigration to largely exceed emigration. On the whole the introduction of canal irrigation and the fine soil of much of the district have produced an excess of immigration.

SIRSA.—The conditions here are quite exceptional, and are fully described in the postscript to this chapter. Not 50 years ago the Sirsa district was a sort of No-man's-land, uninhabited save by a few marauding Bhattis and other nomad tribes. Under English rule it has attracted population from all directions, and not two-thirds of even its village population were born in the district. The moderate proportion of males among the immigrants shows how permanent is the type of immigration, while the excess of females in the figures for emigration shows that much of it must be referred to the reciprocal type. In the case of emigrants to Montgomery indeed, the percentage of males is somewhat high; and this is due to the fact that scarcity of pasture had driven the Sirsa cattle with their herdsmen to the river banks in search of pasture; and the same is true in a less degree of Firozpur, and perhaps of Hissar, where the canal affords a plentiful supply of grass. An immigrant population entering a tract of uncertain rainfall takes some years to settle down; a bad year will send many of them back again, while a succession of bad years will drive many of even the older residents into other districts in search of pasture or employment. Had not the Census been preceded in Sirsa by several seasons of scanty rainfall, the immigration would have been even larger and the emigration even smaller than is shown by our figures. The only tract from which more females than males have entered the district is Patiala; and the exception is due to the fact that the Sikh immigrants from the north will not marry the Bagri settlers from Rajputana, but look to their place of origin for wives for their sons.

AMBALA.—Here the effect of large cantonments in attracting population from a distance is at once apparent, the village population 92 per cent. is indigenous; of the town population only 73 per cent. On the other hand emigration to Lahore and Firozpur, where as large or larger cantonments exist, is in excess of the immigration as between Ambala and the districts which march with it the migration is in the direction of least pressure, and the proportion of emigrants to immigrants increases throughout as the density of population of the receiving district decreases. The uninhabitable hill area included in Ambala makes the figures for density on total area misleading, and the cultivated area afford a truer measure of the pressure of population. Excluding Simla and Dehli, the circumstances of which are exceptional, the migration to and from Ambala consists in taking population from the more densely peopled sub-montane districts, and giving it to the more sparsely peopled tracts to the south and south-west. Similarly generally, the proportion of males shows that the emigration to the districts from which it is receiving and the migration from those to which it is giving are largely reciprocal in their character; while the movements in the remaining directions are to a great extent permanent, with a tendency to be temporary in the case of some of the more distant districts. The excess immigration from Karnal, Ludhiana, and the Native States, all of which march with Ambala, is very largely reciprocal. * The large excess immigration from the North-West Provinces is for the estimates only. If the excess exists the presence of the cantonments no doubt partly explains it.

LUDHIANA—With its extensive riverain occupies an intermediate position between the thickly peopled sub-montane districts in the north and the unirrigated plains to the south. From overcrowded Ambala, Jalandhar, and Hoshyarpur it receives surplus population, while it attracts immigrants from the central states which lie to its south. On the other hand, the rapid extension of canal irrigation in Lahore, Amritsar and Firozpur has attracted a large emigration to those districts. Much of the migration in the case of Firozpur, Ambala, and Jalandhar, and almost all the emigration to Hoshiarpur, is of the reciprocal type, while in the case of the Native States no less than seven-tenths of the migrants are women. The Kashmir colony in the town of Ludhiana does not appear to have been recruited to any considerable extent during the lifetime of the present generation.

SIMLA—Is so wholly exceptional and insignificant that I give no separate table for it. The main figures are as follows. Even of its winter inhabitants not 78 per cent. of the rural and not 29 per cent. of the urban population were born in the district, while among the urban males the proportion falls to 25 per cent. As many as 95 per cent. of its population were born in India, but among the males of the town the figure is only 89 per cent., 3 per cent. being born in other parts of Asia, chiefly Ladakh, and 8 per cent. in Europe. It receives immigrants from almost all parts of the Province, but more especially from the neighbouring districts of Kangra, Ambala, and Hoshyarpur, and the North-West Provinces, the greater number of whom are males. Its emigration is almost entirely to Kangra and Hoshyarpur, and here the females exceed the males. If the Census had been taken during the season, the number of immigrants would of course have been enormously increased.

JALANDHAR—Has the densest rural population of all the districts in the Province, yet it is so fertile that immigration is in excess of emigration. But it is noticeable that the only tracts from which immigration is in excess of emigration are Sialkot and Hoshiarpur. The former is itself nearly as densely peopled as Jalandhar, while the migration is insignificant in amount. Hoshiarpur, though the density of its population on total area is smaller than that of Jalandhar, includes a large area of uninhabited and unculturable hill sides; and its rural population distributed over culturable area give the highest density, and over cultivated area the highest density but one among the Panjab districts; and indeed Sialkot follows next, and after both comes Jalandhar for both these densities, so that migration really moves in these cases also in the direction of least pressure. All the other districts are less thickly peopled than Jalandhar, and to all of them Jalandhar gives population; while, speaking generally, the excess of emigration over immigration is largest for those places where density of population is smallest. Thus were it not for Hoshiarpur, emigration would be 16 per cent. in excess of immigration. Especially Jalandhar finds relief from pressure of population by emigration to the rapidly developing district of Firozpur, where so much has lately been done to extend canal irrigation, and to the Native State of Kapurthala, which, possessing equal physical advantages with itself, has a far less dense population. The low proportion of males shows that much of the migration to and from the tracts which border on the district is reciprocal, except in the case of the emigration to Firozpur, and in a less degree to Ludhiana, which is more permanent in its nature. The emigration to Rawalpindi is probably due to the movements of troops, as is the immigration from the North-West Provinces.

HOSHIARPUR.—This is another of the few Panjab districts which lose more than they gain by migration. I have already explained that its population, considered in relation to the culturable and cultivated areas, is the densest in the Province. But these areas, already insufficient for the needs of the people, are being constantly diminished by the destructive action of the hill streams, which year by year cut away good soil and leave unproductive sand in its place, while the denudation of the hill sides has deprived a considerable population of their means of subsistence. The consequence is that twice as many people have emigrated from as have immigrated into Hoshiarpur, and the low percentage of *males among the immigrants shows how almost wholly such immigration as has taken place is of the reciprocal type.* The emigration on the other hand is chiefly permanent except to the two neighbouring districts of Jalandhar and Gurdaspur, where the pressure of population is almost as great as in Hoshiarpur itself, and into which a good deal of the emigration is reciprocal. Excepting abnormal Simla, Hoshiarpur gives to every district more than it takes from it; but especially it sends its surplus population to the fertile plains of Jalandhar and of the state of Kapurthala, and to the canals of Amritsar and the river valley of Firozpur and Ludhiana. The high proportion of males among the emigrants to Rawalpindi and Simla shows how temporary is the nature of the migration.

KANGRA.—In Kangra the density of rural population per square mile of culturable area is higher than in any other Panjab district except Simla; but the mountain sides afford pasture to numerous flocks and herds, and the carrying trade with Central Asia contributes to the means of the people. The population is largely indigenous, 95 per cent. of the villagers being born in the district; and interchange of population is confined to the neighbouring districts and states. The contrast between the proportion of males among the emigrants to and immigrants from Simla respectively, shows strikingly how temporary is the one and how reciprocal the other movement; while the same test shows the relative nature of the migration to and from the over-crowded district of Hoshiarpur to be exactly the reverse, the emigration being reciprocal and the immigration not temporary indeed but permanent. The migration to and from the Hill States is apparently largely permanent, and is discussed in section 159. The immigration from Chamba, however, which forms a considerable proportion of the whole, is chiefly periodic. The immigration from Kashmir is doubtless a result of the late terrible famine which has desolated that country; and the moderate percentage of males shows how largely whole families must have fled from starvation. The permanent colonies of Kashmir shawl-weavers at Nurpur and Tilokanth have *almost disappeared with the falling-off in the trade.*

AMRITSAR.—The attractive influence of a great centre of commerce is at once apparent in the figures. Amritsar draws population from all parts of the Province. While 90 per cent. of the rural population is indigenous, no less than 30 per cent. of the people of the town are born out of the district, and nearly 9 per cent. beyond the *limits of the Province; 4 per mille come from outside India, of which one-half are from Asiatic countries.* Amritsar is one of the most thickly peopled districts of the Panjáb, but it is profusely irrigated by the Bari Doab Canal, and has on its borders the sub-montane districts of Jalandhar, Hoshiarpur, Gurdaspur, and Sialkot, where the density of population is at least as great as and its pressure greater than in Amritsar itself. From these districts it takes population, while it gives it to the fertile and moderately populated state of Kapurthala, and to the districts of Lahore, Firozpur, and Montgomery where the population is sparse and canal irrigation has lately been enormously extended, to the great cities of Multan and Peshawar, *and to the temporary labour-markets of* Rawalpindi and Jhelam. From most of the other distant districts it receives immigrants in excess of its emigrants. The migration from Jalandhar to and from Gurdaspur, to Sialkot, and from Firozpur and the Native States is largely reciprocal in type; all other migration is permanent, or, in the case of the emigrants to Rawalpindi and Jhelam, temporary. Kashmir contributes three-quarters of the surplus population due to migration, though here a large part of the migration is probably due rather to the demand for skilled labour on the shawl looms of Amritsar than to the pressure of famine in Kashmir.

GURDASPUR—Is another of the very densely populated districts; and the pressure is still greater than the figures would show, owing to the inclusion of a considerable area of hill. The culturable area being scanty, an unusually large proportion of its population exists otherwise than by agriculture, and responds readily to any special demand for labour, such as existed in Rawalpindi and Jhelam at the time of the Census. The only districts it takes from are *Hoshiarpur, and to a much less extent Jalandhar and Sialkot,* all three of which have a population more dense than its own; while it sends surplus population in enormous numbers to the rapidly developing district of Lahore, and in smaller numbers to every other district in the neighbourhood, the excess of emigration over immigration increasing generally as the density of population of the receiving district is smaller. Emigration on the whole exceeds immigration by 28 per cent., a figure which would be raised to 69 per cent. were the famine-stricken fugitives from Kashmir deducted.

Of the remaining districts how much of both emigration and immigration is reciprocal, but more especially of the latter.

Part II.—Migrations of the People.

SIALKOT.—The pressure of population in Sialkot is greater than in any other district, except perhaps Hoshiarpur. Consequently emigration exceeds immigration in every case but one; and were it not for the influx of fugitives from the Kashmir famine, who constitute more than a quarter of the whole immigrants, the proportions of the migration into and out of the district would be 100 to 173. With Gurdaspur indeed the exchange of population is nearly equal; and curiously enough the same is the case with Gujranwala, perhaps because the part of that district lying on the Sialkot border is itself very thickly peopled. In these two cases the movement either way is chiefly reciprocal, witness the low proportion of males. But in all other cases the excess of emigrants is exceedingly large, while the percentage of males is much larger for emigration than for immigration, showing that the former is rather permanent, and the latter reciprocal. The only exception is in the case of Gujrat, which is also the only exception to the rule that emigration is in excess of immigration. Why Gujrat should be an exception I am unable to explain. The movement of emigration in excess of immigration is chiefly to Lahore, where the extension of canal irrigation among other things has largely developed cultivation. The considerable number of immigrants from the N.-W.-Provinces is owing to the large cantonments at Sialkot.

LAHORE.—The capital of the Province naturally attracts immigrants from all quarters. Besides this the irrigation from the Bari Doab Canal has given an immense impulse to cultivation in the Lahore district, and has been largely extended within the last 10 or 12 years. Consequently Lahore takes population from all the districts in the list which lie east of it, and from the sub-montane districts of Sialkot, Gujrat, and Gujranwala, in all of which the pressure of population is greater than in Lahore, and also from Jhang in which no irrigation exists. But it gives to Montgomery and Firozpur, in which also canal irrigation has been largely extended while population is scanty in proportion to cultivated or culturable area, to the great commercial centres and cantonments of Multan and Peshawar, and to the temporary labour-marts of Rawalpindi and Jhelam. We have now almost passed out of the region of reciprocal migration, though the figures for Amritsar still show some indications of its presence; and the bulk of the movement is permanent except the emigration to Peshawar, Rawalpindi, and Jhelam, which is partly temporary. On the whole the irrigation is 237 per cent. of the emigration, and would be 601 per cent., if it were not for the emigration to the Canals of Amritsar, Firozpur, and Montgomery.

GUJRANWALA.—Though the density of population on total area is exceedingly small, this district includes a large area of arid pastures which have at present no irrigation, and the population per square mile of cultivation is exceedingly high. Consequently it gives to all districts, except Sialkot and Gujrat in which the pressure of population is even greater than its own, and especially it sends population to the newly irrigated lands in Lahore. The exchange with Sialkot and Gujrat seems to be largely reciprocal. In other cases it is permanent, except the emigration to Pindi, Jhelam, Multan, and Peshawar, which is naturally to a great extent temporary, being due to the presence of cantonments or the temporary demand for labour. The immigration from Kashmir is said to be for the most part of old standing.

FIROZPUR—Is an eminently progressive district. Canal irrigation has been largely extended of late years, and it is not surprising to find that the immigration is 70 per cent. in excess of the emigration. Sirsa, which is developing even faster than Firozpur, is the only district that takes from it. The emigration is much more largely of the reciprocal type than is the immigration, especially in the case of the districts to the east, where the marriage customs which lead to reciprocal immigration prevail. It will be noticed how much larger the proportion of immigration to emigration is in the case of those districts where pressure of population is greater, than in that of the less thickly peopled districts. The immigration from the North-West Provinces is of course owing to the presence of large cantonments.

RAWALPINDI.—I have already alluded to the extraordinary demand for labour which work on the Panjab Northern State Railway and the transport arrangements in connection with the Kabul campaign had created at the time of the Census; and consequently we find that, with the exception of Peshawar and Kohat where precisely similar circumstances had produced an even greater demand, Rawalpindi takes from every district in the list. The immigration is to the emigration as 349 to 100; yet 93 per cent. of the village population and 96 per cent. of the village females are born in the district; while of the town population only 52 per cent. of the persons and 44 per cent. of the males are indigenous. The fact is that, apart from the actual work in progress at the time of the Census, the construction of the Railway and the temporary fixing of its terminus, workshops, and head-quarters at Rawalpindi attracted an enormous foreign population, the number of souls in the town of Pindi itself having risen from 28,586 to 52,975 since 1868. Moreover a series of bad seasons had driven numbers of headsmen with their cattle into the Murree Hills in search of pasture. The large proportion of males among the immigrants shows how generally temporary the immigration is, and how never reciprocal. The figures for emigration are curious. The only district to which emigrants have gone from Pindi in any numbers are Jhelam, Peshawar, Hazara, and Kohat; that is to say, there is no emigration across the Salt-range. I have already pointed out that the trans-Jhelam tract is hardly a part of India; and its people are so distinct in habits and race from the people of the plains that they decline to settle among the latter. The large immigration from the North-West Provinces is due to the cantonments and movements of troops. That from Kashmir largely consists of famine-stricken fugitives attracted by the demand for labour. The immigrants from Afghanistan are chiefly Hazara coolies employed on the new Railway. "where," writes Mr. Steedman, "was assembled a motley crew of Kashmiris, Hazaras, Pathans, Western Punjabis, Musalman Jats from the Rechna *Doab* and Purabiahs from Oudh and the North-West Provinces, almost exclusively males."

JHELAM.—The remarks on the Pindi figures apply almost equally to Jhelam. For a long time the town of Jhelam was the terminus of the Railway, and its population was 5,148 in 1868; it had increased to 11,319 in 1878; and to 16,6[illegible] in 1881. Practically the only emigration across the Jhelam is into the neighbouring district of Gujrat, the people [illegible] which are somewhat akin to those of Jhelam. It is in great part reciprocal. Moreover Jhelam includes the Cis-Sa[illegible] range valley of the right bank of the Jhelam, to which, of course, the remarks made concerning the trans-Salt-range tract do not apply. The immigration from Kashmir is largely due to the late famine, though there are a good many Kashmiris permanently resident in the district.

GUJRAT.—Here again the pressure of population is very great, and Gujrat gives to every district in the list, even to Amritsar and to Sialkot where the pressure is still greater. But all the other neighbouring districts are very scantily peopled, and the surplus population of Gujrat flows into them readily; and if it were not for the large influx of people driven by famine from Kashmir, emigration would exceed immigration by 52 per cent. A great deal of such immigration as there is is of the reciprocal type, but the emigration is almost entirely permanent.

SHAHPUR—Is not only a very sparsely populated district, but canal irrigation has been considerably extended of late years. Consequently Shahpur takes population from the neighbouring districts of Gujranwala, Gujrat, and Jhang. But the disinclination of the trans-Salt-range people to cross the range which has been already alluded to is shown by the almost absolute absence of immigration from the tract in question except in the case of Jhelam, which is hardly an exception, as both districts include at once cis-Salt-range country and a part of the range itself. The excess emigration into Jhelam and Pindi is of course accounted for by the abnormal demand for labour in these districts at the time of the Census; and the high percentage of males shows how largely temporary, in the case of the latter district at least, the emigration was. The immigration into Derah Ismáil and Bannu is probably due to the semi-nomad population of the *Thal* or sandy prairies of Shahpur tending towards the valley of the Indus as they gradually settle down and take to agricultural pursuits. The emigrants are probably largely graziers pasturing their herds in the Shahpur plateaus.

MULTAN—Is a scantily peopled district, while there has been an immense development of canal irrigation of late years; and it is surrounded by districts in which the pressure of population is markedly greater than in itself, on cultivated at any rate, if not on total area. Consequently it takes population from every district save Muzaffargarh, where the development has been even greater still. The number of immigrants is more than three times the number of emigrants; indeed there has been hardly any emigration except to Muzaffargarh and Bahawalpur, where also a great development has lately taken place under British management. Multan has attracted settlers from the rival centres of commerce at Lahore and Amritsar, while the unirrigated district of Jhang with its scanty cultivation, and the barren plains of Bahawalpur, have sent it large numbers of immigrants. The immigration from the North-West Provinces is due to the cantonments. The proportion of males is naturally higher in the case of the more distant districts.

JHANG—Is a singularly backward district. Though population is sparse, much of the area consists of arid plains without irrigation of any sort, and the population is really dense in proportion to the cultivated area. Consequently it gives population to every district in the list except Gujranwala, and the emigrants are nearly twice as numerous as the immigrants. The emigration is particularly large to Shahpur, Montgomery, Muzaffargarh, and Multan, four neighbouring districts in which canal irrigation has greatly developed of late years. The immigration probably consists to a great extent of people who have left the steppes of the neighbouring districts for the valleys of the two rivers which run through the district, and the moderate proportion of males would seem to show that the migration is permanent; though with the nomad tribes of the *bár* who travel with their families, the test is perhaps of less value than elsewhere, and it is not impossible that many of the immigrants are graziers with their herds who have come to pasture in the Jhang steppes. On the other hand, the former explanation is supported by the fact that the Multan *bár*, the only one which is separated from Jhang by a river, has sent hardly any immigrants.

MONTGOMERY.—Of late years canal irrigation in the Montgomery district has received an enormous impetus from the construction of new inundation cuts, and immigrants have been attracted from the surrounding districts, and more especially from Lahore. Yet the similar extension of irrigation in Lahore, Firozpur, Multan, and Bahawalpur has caused extensive emigration, which has on the whole exceeded the immigration; though if the large emigration to Bahawalpur which took place when the State came under English management were deducted, the movement would be markedly in the opposite direction. The moderate percentage of males among both emigrants and immigrants shows how largely permanent the migration has been, though a portion of it is doubtless due to the movement of herds to the river valleys in consequence of the drought which preceded the Census.

MUZAFFARGARH—Has developed of late years more rapidly than almost any other district in the Province; the soil is naturally fertile, canal irrigation has been enormously extended, and it is not surprising that the immigrants are nearly three times as numerous as the emigrants. The disproportion is greatest in Jhang where there is no irrigation, and smallest in Multan where a similar impulse has been given to irrigation. The high percentage of males seems to show that the small emigration has been chiefly temporary, while the rest of the migration appears to have been in great measure permanent.

DERAH ISMAIL KHAN.—Excluding Afghanistan, migration to and from this district is small in extent; and while it gives population to the canal-irrigated districts of Multan, Muzaffargarh, and Derah Ghazi, its riverain has attracted population from the dry districts of Shahpur, Jhang, and Bannu, all of which are less sparsely populated than itself. The high male percentage shows that a part at least of the emigration to Multan is temporary, and probably connected with commerce. The enormous immigration from Afghanistan is of course due to the *pawindah* caravans already described in section 142, and to the usual movement from the hills to the plains which takes place on the approach of winter.

DERAH GHAZI KHAN—Also enjoys a considerable extent of canal irrigation, and the immigration is consequently largely in excess of the emigration, save in the case of the still more favoured district of Muzaffargarh. The immigration from Afghanistan probably represents *pawindah* herdsmen who have wandered down the river in search of pasture,

Part II.—Migrations of the People.

BANNU—Has a very large immigration from Afghanistan, partly due to the bad seasons preceding the Census which drove the frontier tribes into our territory in search of labour, but more largely to periodic migration, and still more so to the permanent settling of these men in lands acquired by them on the border of the district, a process which has gone on in Bannu and Peshawar probably to a larger extent than in any other frontier district. The moderate percentage of males shows that no very large proportion of the immigrants consists of labourers in search of work. *Deducting this migration, movement to and from the district is pretty evenly balanced,* and is not extensive, being largest in the case of Derah Ismail Khan, to which Bannu had sent, at the time of the Census, a considerable number of herdsmen from the Mianwali steppes in search of pasture in the wide Indus Valley of the former district.

PESHAWAR.—The figures bear on their face marks of the attraction exercised by a large military and commercial centre, and of the extraordinary demand for labour that existed at the time of the Census owing to the Kabul campaign, and the Railway and Swat canal works. Immigrants are more than six times as numerous as emigrants, and the exceedingly high proportion of males among the former show how largely temporary the immigration was. Nearly half the immigration was from Afghanistan; and here the more moderate percentage of males shows that much of the movement is due to the settlement of border tribes just described under the Bannu district, and to the periodic migration alluded to in section 142. The immigration from the North-West Provinces is in connection with the troops, that from Europe consists of course of the troops themselves, while that from Kashmir consists of famine fugitives in search of labour. Excepting these countries, the immigration into Peshawar, though varied, is not extensive in any single case. The emigration is inconsiderable save to the Railway and road works of Rawalpindi and Kohat; and to Hazara, probably in search of pasture.

HAZARA.—This great Himalayan valley is so secluded that it exchanges population with but few portions of the outer world. Numerous herdsmen were driven from Rawalpindi with their flocks and families into the Hazara plains in search of pasture, while large numbers of Kashmiris crossed the border in their flight from famine. The considerable immigration from Afghanistan probably consists of periodic immigrants from the high mountains which surround the district on three sides, descending to the lower valleys and plains before the snows of winter.

KOHAT.—The great demand for labour on the Thal road, and in connection with the movement of troops at the time of the Census, is shown by the fact that immigrants are nearly seven times as numerous as emigrants, and by the high proportion of males among the former. The immigration from Afghanistan especially was enormous. Much of the work was of such a nature that it could only be performed safely by border men, while the comparatively moderate proportion of males shows that the periodic and permanent immigrations already described as prevailing on our border, combined to swell the numbers. The graziers wintering in the Kohat plains were, as a fact, unusually numerous in the Census year.

Part III.—Increase and Decrease of Population.

PART III.—INCREASE AND DECREASE OF POPULATION.

176. Tables and figures.—No reliable statistics of the population of Native States being in existence of a date prior to the present Census, this portion of the Chapter deals only with British Territory, and has no concern either with Native States or with the Province as a whole. The statistics of increase and decrease are contained in Tables II and XIX, Appendix A, the former of which refers to districts, while the latter gives details for individual towns. The comparison is, of course, based upon the figures of 1855 and 1868, the accuracy of which is discussed in section 178. Supplementary Tables J and K of Appendix C give the estimated population of each district for each year from 1882 to 1891 assuming past rates of increase to continue *unaltered, and the population of each Municipality according to the three enumerations of* 1868, 1875, *and* 1881. *But before the* figures of past years could be utilised for the purpose of comparison, it was necessary as far as possible to correct them so as to allow for alterations of boundary which have taken place. So far as the figures of 1855 are concerned, any such correction was wholly out of the question. The boundaries of the Province, including the Dehli Territory, have changed considerably since that year, while its internal division into districts has been altogether recast. Thus all that can be done is to make such use as is possible of the figures as they stand, bearing in mind the changes that have taken place.

Since 1868, however, the alterations in the boundaries of British Territory as a whole have been very small, being wholly due to river action. But on examining the figures of 1868, it was found that the Nawáb of Amb, who holds feudal Tanáwal in the Hazára district of our territory, had included in his returns for that year the population, not only of Tanáwal, but also of his independent territory of Amb which lies beyond our frontier and forms no part of the Panjáb; and that those returns had been transferred as they stood to the published Census tables, which *therefore represented the population of Amb as well as* of the Panjáb. Thus the corrections to be made in the published figures of 1868, so that they should *represent* the population as then enumerated of Panjáb British Territory as it now stands, were as shown in the margin.

	Males.	Females.	Persons.
Population of British Territory as returned in 1868	9,595,434	8,016,064	17,611,498
Add—Gain by transfer of villages from Baháwalpur to Montgomery	476	401	877
	9,595,910	8,016,465	17,612,375
Deduct—Loss by transfer from Dehli to North-West Provinces	69	50	119
Loss by transfer from Gurgáon to North-West Provinces	347	272	619
Loss by transfer from Amritsar to Kapurthala	121	100	221
Population of independent Amb, wrongly included in 1868	1,065	833	1,898
Balance—Or population of British territory as it now stands, according to Census, 1868 .	9,594,308	8,015,210	17,609,518

It is possible, perhaps probable, that the boundary within which the Census of 1868 was confined on our North-West frontier was not precisely the same as that to which the present operations extended. The Deputy Commissioner of Pesháwar then wrote: "The area of the district has been taken up to the red line which marks an imaginary boundary between British "and Independent Territory; but the real limits of the Census are well within this line;" and even in 1881 the Commissioner of Pesháwar was called upon for a ruling as to whether certain villages were or were not to be considered as belonging to the Panjáb for the purposes of the Census. It is impossible to allow for such changes as may have taken place in the Census boundary in this direction. If any, they are certainly very small, and probably include tracts which were excluded from the former Census.

177. Within the Province transfers of territory from one district to another have been numerous, and in some cases very extensive. I attempted in the first instance to base the necessary corrections upon the detailed registers showing the population of each village which had been prepared at the last Census. But in many districts these figures did not agree with those of the printed tables, and in some cases the discrepancies were enormous. Thus in Jálandhar the registers showed 40,000 too few males and 19,000 too many females, while in both Jhang and Ráwalpindi the difference exceeded 6,000 souls, and no examination of the figures threw any light on the matter[1]. This attempt therefore had to be abandoned, and I was compelled to make the adjustments by taking the printed tables as correctly representing the population of the several districts as they stood in 1868, and *adding or deducting the population* of such villages as were known to have been transferred to or from each since that year. I fear some transfers may have escaped notice; but the resulting error, *if any, will certainly be insignificant in comparison with the total population of the district concerned.* The figures thus corrected form the basis of Table II.

In the case of individual towns there was literally nothing on record to tell us what boundaries had been *followed in 1868.* Wherever the records of the last Census gave us separate details of population for urban suburbs, I have included the population *of the suburbs now* taken as part of the town in the figures for 1868 given in Table XIX. Where this was not the case there was nothing for it but to accept the published figures of 1868 as they stood. In the case of Municipal towns we have an intermediate set of figures available for comparison, as a separate Census of almost all of them was taken on the 28th February 1875. In the report of that Census, indeed, an entirely new set of figures are given for 1868, which agree neither with those of the published report of that year, nor with the figures now given in Table XIX. It does not appear how those figures were obtained[2]. But as regards the Census of 1875 we know exactly what boundaries were followed, as the Census was, in all cases, of the population living within municipal limits.

178. Increase due to greater accuracy of enumeration.—The increase or decrease of the population of a given tract of country during the interval between any two enumerations, as shown by a comparison of the figures of the one with those of the other, may be due to any combination of the following causes:—

(1) Greater accuracy of enumeration on the one occasion than on the other;

(2) Movement of population into or out of the tract during the interval;

(3) Actual increase or decrease of resident population owing to the number of births during the interval having been greater or less than the number of deaths.

And first as to the comparative accuracy of the respective enumerations. It follows almost necessarily from the very nature of things that in 1868 greater accuracy should have been attained than in 1855, and in 1881 than in 1868. In 1855 the Province had not long come under our rule, while even the last thirteen years have seen a great improvement in the administrative machinery, and especially in the revenue staff upon which so large a part of the operations devolved. The system of the present Census was elaborated with far greater pains and minuteness, and far more care was taken to secure uniformity and accuracy than on either of the previous occasions. Above all, whereas at former enumerations a mere figure was given for the total number of souls dwelling in each house, in the present Census each person was separately entered by name; and *it is difficult to overrate the capital importance of this change in securing* accuracy of enumeration. Meanwhile the people, ignorant always, and at first suspicious of any new thing,

[1] I fear some discrepancies, though not I hope of any large amount, may be found between my tables and the small vernacular abstracts which I have prepared for the use of district officers. The latter are mere extracts made from the bulky original tables (which also have been sent to the District Offices) for convenience of future reference; and errors in copying may have escaped detection. If so, the original tables should be referred to for the correct figures.

[2] But in comparing them with those of 1855, Dr. DeRenzy writes: "It is to be regretted that, owing to the boundaries of towns as censused in 1868 not "coinciding with those which were recognised in the present Census (1875), it is impossible in many cases to draw any safe conclusion as to whether there has been "an increase or a decrease of population."

Part III.—Increase and Decrease of Population.

loss has just been shown to have been earlier in Jhang than in Montgomery, even if the latter district has not actually gained by migration since 1868, the disproportion between the natural rates of increase in the two districts becomes less marked for the longer and more marked for the shorter interval, and more conclusively proved on the whole. These instances will serve as examples of the manner in which the figures may be discussed. I shall not attempt to examine them in detail, since to do so would require lengthy explanations and minute discussions which the very approximate nature of the results would not warrant. But generally they will be found to indicate as probable results that the emigration from the overcrowded districts has only lately begun, and was in many cases probably preceded by immigration; that the immigration into the eastern districts largely preceded, and that into the median and western districts has been for the most part subsequent to the Census of 1868; that the natural rate of increase is much higher in the western than in the eastern districts; and that among the former the presence of canal irrigation has a marked effect in lowering the natural rate of increase due to excess of births over deaths.

185. Effect of density of population upon increase and decrease.—Abstract No. 40 below is prepared on exactly the same plan as Abstract No. 38 on page 88, density of population per square mile being taken as the basis of arrangement instead of proportion of males to persons. The limits of many of the districts have altered greatly since 1855; but such changes affect density much less than they affect total population, and the comparison is probably not much impaired by them in the majority of instances.

(*b*) Present areas taken throughout.
(*c*) Old Gugaira District.
(*d*) Old Khangarh District.
(*e*) Old Leiah District.

NOTE.—This table may be read thus The density of the Dehli population was 487 per square mile in 1855 (column 3) and 496 in 1868 column 4). Thus the increase in density was 2 per cent. (column 7).

Now if the increase of population had always been largest in those districts in which the population was least dense at the beginning of the interval during which the increase has taken place, the serial numbers of columns 10 and 11 would be in exactly the reverse order of those of column 9, and those of column 13 the reverse of those of column 12, the sum of the two figures for each district in each case amounting to 33. That this is generally the case is obvious from inspection of the figures. Dividing them into six groups as they stand, we have for the totals of the serial numbers the figures shown in the margin, the fifth group being spoilt by Kángra, the only conspicuous exception, and a district in which density of population on total area has no significance, much of it being uninhabitable mountain. Generally the tendency to most rapid increase in the least densely populated districts is very well marked, the variations being explainable by causes to be presently noticed.

Group.	Column 9.	Column 10.	Column 11.	Column 12.	Column 13.

* Sirsa excluded from males and females. † Simla and Khaibar Pass excluded throughout, and Sirsa from males and females. ‡ Simla excluded.

NOTE.—(*a*). The Census here quoted as that of 1855 was taken on 1st *January* 1853 in Dehli, Gurgaon, Hissar, Rohtak and part of Karnal. For Sirsa the figures are taken from a Settlement Census made village by village between 1852 and 1863. In the rest of the Province the Census was taken on 1st January 1855.

(*b*). Between the enumeration of 1855 and 1868, Dehli gained Balabgarh and lost its trans-Jamna parganah. Rohtak also gained Jhajjar; but a proportionate addition has been made to its figures for 1855.

Part III.—Increase and Decrease of Population.

Unfortunately the boundaries of some of the districts have changed so much that I have been unable to give separate figures for them. Even as it is, the respective figures do not in all cases refer to exactly the same areas; but the difference is generally small. The districts of Hissár and Sirsa, the extraordinary development of which has so often been alluded to, head the list, the increase since 1855 having been 47 per cent. in the one and 39 per cent. in the other. In company with them stand the frontier districts of Kohát, Hazára, and Derah Gházi, and the dry and healthy districts of Jhang and Ráwalpindi. The increase in the frontier districts is doubtless due in part to more accurate enumeration [1], and it is probable that Derah Ismáil and Bannu would stand with them if their figures could be separated from those of the canal-irrigated tracts of Muzaffargarh. Montgomery, Pesháwar, and Multán, with their copious irrigation from canals, come well at the bottom of the districts of the Western Plains, and this notwithstanding that gain by migration has been greater in the two last than in almost any other of the western districts. The difference between the rates of increase in the east and west of the Province respectively is very striking. The Ráwalpindi, Multán, and Derájat divisions taken together have increased by 21 per cent. since 1855, while the increase in the Dehli and Ambála divisions has been only 7½ per cent.; and the contrast is chiefly due to actual difference in the normal rates of increase of the two tracts, for the whole gain by migration in the western divisions has been only about 5 per cent. But the reason is obvious. In 1855 the Eastern Panjáb had been for 52 years under a strong and orderly rule, while the western districts had only been six years in our hands.

187. The figures are too incomplete to call for more minute examination; but columns 6 and 7 deserve a word of notice. The intervals between the successive enumerations having been identical, the figures of these columns should be equal; and where they are not equal it follows that the rate of increase during the last 13 years has been different from that obtaining during the 13 years previous to 1868. The increase between 1868 and 1881, however, is smaller than that between 1855 and 1881 in every case except in Montgomery and Multán, where the increase during the latter interval has been considerably greater than during the former. The exception is of course due to the extension of canal irrigation which has lately taken place in those two districts. The generally smaller increase has already been explained by the famine and disease which succeeded the Census of 1868 and preceded that of 1881. But the cases in which the contrast is very large are interesting. In Hissár the tide of immigration had evidently ceased to flow by 1868, while in Sirsa it has continued in almost unabated fulness. The loss to Jhang by emigration to the new canals of the neighbouring districts, most of which are of later date than 1868, accounts for the contrast between the figures. The emigration from the crowded districts of the Jálandhar and Amritsar divisions, also, has evidently largely taken place within the last 13 years, the rate of increase in these districts between 1855 and 1868 having been quite normal.

188. Increase since 1868, Western Districts.—Abstract No. 42 on the opposite page gives statistics regarding the increase of population since 1868 [2]. I have taken the increase in the *male* population only for the basis of the abstract, as giving on the whole a more trustworthy indication of real increase as distinguished from apparent increase due to more accurate enumeration.

The same general features which have already been discussed here present themselves again. The increase altogether has been small owing to the famine and disease which have marked so many of the last 13 years. But these influences have had much less effect in the western than in the eastern districts. Not only are the former with their small rainfall generally far healthier than the latter, but their cultivation is almost entirely protected by irrigation, and failure of rain means only a smaller yield, whereas in the east it means that no crops are even sown over a large proportion of the area. Moreover, as Mr. Dames remarks of Derah Ismáil Khán—

"Bad seasons and high prices do not operate with the same force on a scattered population accustomed to regard bad seasons "as a part of the order of nature, and not as abnormal visitations, as they do in the more favoured parts of India where the conditions "of life allow the population to increase up to the verge of subsistence, and where a failure of crops means famine. The famine "prices of Behar and Oudh would here be considered as phœnomenally low, yet the prevailing high prices do not betoken any-"thing resembling famine, and have no effect in checking the natural expansion of the population."

Especially the increase has been large in the frontier districts, partly because of special circumstances which created a temporary demand for labour, but still more because in those districts peace and order have made greater advances within the last 13 years than in any other part of the Province. Major Plowden writes from Kohát:—

"It is a common saying in those villages more exposed than others to incursions from trans-border, that whereas formerly they "could only cultivate within gunshot of their villages, they can now do so wherever water will reach."

With them stand at the top of the list the not long ago desert district of Sirsa [3] and the districts of Firozpur, Lahore, Multán, and Montgomery, in which canal irrigation has been enormously extended since 1868. In all these districts the increase lies between 18½ and 16 per cent., or, taking both sexes into account, between 20 and 13 per cent. Considering the immigration into Muzaffargarh, almost all of which is of recent date, the low rate of increase is extraordinary, and seems to point to the same unhealthiness and infecundity as results of extensive canal irrigation of which I shall presently display more lamentable examples in the Dehli Division. Emigration to the new canals explains the small increase in Jhang, Sháhpur, and Gújránwála; the population of Derah Ismáil is uncertain, depending much upon the amount of *pawindah* immigration for each year; while some cause or other, probably pressure of population, is driving people out of Gújrát; and this brings us to the second break in the figures of column 3, the increase in the districts mentioned above lying between 13 and 9 per cent., or, if both sexes be taken, between 14 and 12 per cent. Here the average for British Territory divides the list into two parts, and also sepa-

[1] It is just possible that the feudal territories of Tanáwal and Teri in Hazára and Kohát respectively were not included in the Census of 1855.

[2] I should like to have compared this increase with increase in cultivation during the same period. But the available figures for cultivation are so absolutely worthless (showing, for instance, that the cultivated area in the Montgomery district has decreased by 33 per cent. since 1868) that I will not waste time over them.

[3] It is worthy of note that Sirsa is now making up its proportion of females, which is always low in an immigrant population attracted to a developing district. The increase in females has been 22 per cent. and in males only 18½ per cent.

Part VI.—The Musalmans of the Panjab.

The figures for the four sects will be found in Table III B., of Appendices A and B, and are summarised below :—

Musalman Sects.	Males.	Females.	Persons.	Proportions.
All Sects [1]	**6,178,199**	**5,341,281**	**11,519,460**	**10,000**
Sunnis	6,064,815	5,242,040	11,306,855	9,816
Shiahs	53,563	48,693	102,256	89
Wahhábis	1,385	1,146	2,531	2
Faráizis	95	70	165	...
Others and unspecified	58,321	49,332	107,653	93
Kapúrthala population [1]	76,938	66,036	142,974	...

Thus it will appear that of the Musalmán population of the Panjáb not 1 per cent. has recorded itself as Shíah, while more than 98 per cent. are returned as Sunnis. As a fact the great mass of the peasantry have, except on the frontier and perhaps in the western districts, never even heard of the distinction between the two great divisions of the Moslem faith, and though they are undoubtedly *Sunni*, are only so because they know of nothing else, and not by deliberate choice or conviction.

282. Abstract No. 57 below gives the proportions which the adherents of the various sects bear to the total Musalmán population in each district, the village population being treated separately, and those districts standing first in which the proportion of Shíahs is largest.

Abstract No. 57, *showing the* **Proportions of Sects** *among* **Rural and total Musalman Population** *for* **Districts** *arranged in* **order of magnitude.**

[1] It is much to be regretted that the Superintendent of the Kapúrthala State should have directed that no sects were to be recorded within his jurisdiction, and thus have rendered our record imperfect. The action he took was only discovered when the figures were sent to my office for final compilation, and it was then too late to supply the omission.

Part VI.—The Musalmans of the Panjab.

The figures show at once how much more rife are sectarian differences in the towns than in the villages. Excluding the Deraját and Kohát, to be mentioned presently, only 6 per mille of the rural population belong to specified sects other than Sunni, against 17 per mille of the urban population; while in 27 out of the 32 districts the proportion of Sunnis is larger in the villages than in the towns. In the Dehli district more than half the whole number of Shíahs live in the city of Dehli itself, while in Pesháwar the sect is unknown outside the walls of the city. The difference is partly due to the more varied character of the city population, which includes travellers and immigrants from Shíah countries; but still more to the fact that the educated classes are chiefly found in the towns, and that as a rule they alone are possessed of the knowledge necessary to develop sectarian differences. It is probable that the number of Shíahs returned is below the real strength of the sect. Their tenets allow them to conceal and even deny their belief, and many of them, more especially Kashmíris, resent the appellation of Shíah as being associated with the still more contemptuous title of Ráfizi (see next section); and the sect is generally held in disfavour, and on the frontier was till quite lately exposed to bitter persecution. Thus the Khojahs of the Deraját very generally profess to be Sunnis, though it is almost certain that they secretly hold Shíah doctrines. The sect is most numerous in the Kohát district, the Shíahs of which are described in section 284, and extend along the Salt-range into Derah Ismáíl, Bannu, Sháhpur, and Jahlam, all of which stand high in the list. The Simla district stands second, owing to the number of Ladáki and Bálti coolies to be found there employed on Public Works. In Jhang the large number of Shíahs is said to date from the invasion of the Shíah conqueror Nádir Sháh. They consist largely of Siál Rájpúts, and are found chiefly in the southern portion of the district. In Derah Gházi, Multán, Derah Ismáíl, and Muzaffargarh the Shíahs are either members of the old Kalhora family, now known as Sarai, or remnants of their rule; while in the Dehli division the influence of the Imperial Court and of the Mahomedan learning of which it formed a centre is still apparent. Shíahs are least numerous in the central, sub-montane, and south-eastern districts, or those furthest removed from Dehli on the one hand, and the frontier on the other. Kohát, Dera Ismáíl, and Jhang are the only districts with as many as 10,000 Shíahs; after them come Sháhpur and Jahlam with over 5,000 each; and these five districts contain more than half the whole number in the Province.

283. Sunnis and Shíahs.—It is probably not strictly correct to apply the term sect to the Sunni belief, as it represents the orthodox church of Islám, and apparently bears a somewhat similar relation to the Shíahs and other schismatics as exists, among English Protestant Christians, between the Church of England and the Dissenting bodies. The Sunnis are those who follow the *Sunnat*, or customs and traditions of the faith; but the other sects also are bound by the traditions, differing only on the question of *what* tradition should be accepted[1]. The Sunnis are divided into four schools, the Hanifi, the Shafaí, the Máliki, and the Hambali. Those of Northern India belong almost without exception to the first, those of Southern India to the second, the third is not represented, while the Wahhábis sprang from the fourth. The differences are chiefly technical. The Shíah or Imámia school declares that the Musalmán religion consists in the knowledge of the true Imám, a point which the Sunnis consider as unimportant, and consists of the followers of Ali, the husband of Fátimah the daughter of Mahomet, and the fourth Caliph. They maintain that on the death of the prophet the office of Imám vested by divine right in Ali, and after him in his two sons Hasan and Husen, and add to the Mahomedan formula of belief the words "Ali is the Caliph of God," while some of them even regard him as an incarnation of the Deity. They necessarily reject as usurpers the first three Imáms, Abu Bakr, Umar, and Usmán, whom the Sunnis accept, and detest the memory of the Ummeyid Caliphs who wrested the Caliphate from its rightful holder, and in particular that of Yazíd who slew the martyr Husen. They observe the first ten days of the month of Muharram as a fast in commemoration of the martyrdom of Ali and his two sons, and carry about *tázíahs* meant to represent the tombs of the two latter, with loud lamentation and mourning. The Sunnis observe only the tenth day of the Muharram, and abhor the *tázíahs*. The Shíah is allowed by his creed to conceal his belief whenever it may seem advisable to do so, either in order to obtain converts or to escape persecution, and to this end he may pass himself off as a Sunni, or even curse the twelve Imáms. In the Panjáb, or at least in its western parts, Shíahs are commonly known as Ráfizis, a name either derived from *rifz* or "abuse," because they curse the first three Imáms and their supporters, or meaning "deserters," because a section of the Shíahs is said once to have deserted the standard of Zaid, the grandson of Husen, because he refused to curse the first two Imáms.

284. Distribution of sects on the frontier.—The Pathán of our frontier, with the exception of those of Tírah and its neighbourhood, are strict Sunnis, abominating the Shíahs and all their works, insomuch that in old days a man hardly dare admit that he belonged to that sect, and even the recognised Shíahs of the towns were not allowed to make or carry about *tázíahs* during the Muharram, while even now the Shíah observances on the occasion of that fast have more than once very nearly led to serious affrays. The Bannúchi have a saying "He is a Shíah's tomb; white outside, but black within;" and another, applied to a shameless man, "A Shíah's ablutions are not nullified by his breaking wind," as a Sunni's would be. The Saiyads and Orakzai Pathán of Tírah however, and their neighbours the Bangash of the Sámilzai country in Kohát, are for the most part known as Shíahs, though they are really followers of a sect called Roshania which arose among the Pathán about the middle of the 16th century. It was founded by one Bazíd, who proclaimed himself a prophet and obtained a numerous following, chiefly among the upper Sulemán and Khaibar mountains. He styled himself Pír Roshan or the Saint of Light, but was called by his opponents and by the historians of the time Pír Tarík or the Saint of Darkness. He laid aside the Qurán and taught that nothing existed but God, who required no set forms of worship, but an implicit obedience to his prophet. His doctrine, as may be imagined, met with many supporters amongst the wild mountaineers, who found a further incentive for joining him in the license he afforded them; for he preached a sort of social communism, and authorised his followers to seize the

[1] The traditions, which pretend to consist of the sayings of the Prophet not embodied in the Qurán, are collectively called the Hadís. The Sunnis recognise six books which are also accepted by the Wahhábis. The four books of the Shíahs are later and "incomparably less trustworthy" compilations.

Part VI.—The Musalmans of the Panjab.

land and property of all who would not accept his creed. At one time this sect embraced nearly half the Pathán nation, including all the Afrídi of Tírâh and many of the Yúsufzai; and in 1600 A.D. one of their leaders even obtained temporary possession of Ghazni. But meddling with politics led to their fall: they were crushed by Akbar and finally dispersed by Jahángír, and their tenets are now professed only by the people of Tírâh, by many but not all of the Bangash of Kohát, and by a few adherents scattered along the trans-Indus Salt-range from the Kohát to the Derah Ismáil district[1]. They are called Shíahs more because they are rejected by the Sunnis than because they follow the Shíah doctrines. The Shíahs of the Pathán frontier will not kill or eat hares, some say because Ali kept hares, and others because they menstruate monthly, a human characteristic.

The cis-Indus Patháns are professedly Sunnis, but are very lax in their observances and the line of distinction is very vaguely drawn, professed Sunnis making and following *táziahs* in company with Shíahs. The latter, on the other hand, belong very largely to the moderate sub-sect of Tafzilis, who, while professing the greatest reverence for Hazrat Ali, do not speak evil of his three predecessors in the Caliphate. In the valley of the Upper Indus the people care little for distinctions of sect, being in fact very poor Mahomedans, openly breaking the fasts, and very few of them even pretending to observe Ramzán.

285. The Biloches were originally Shíahs, and are indeed said to have been driven from Aleppo in consequence of their having taken the side of the Aliites against Yazíd the Ummeyid; and an old historian tells us that "they call themselves, and are called by the faithful, Ali's friends." On this side the Indus they still retain to a great extent their old doctrines in the upper *thal*, though lower down the river they are generally Sunnis, the few Shíahs who are still found there being remnants of the Kalhora rule. In fact a large proportion of the Shíahs of the lower Indus belong to the Sarai family, the existing representatives of the old Kalhora dynasty of Sindh, who, on being expelled by the Patháns, settled in Derah Gházi Khán. The Biloches of the actual border are almost without exception Sunnis, though not nearly so bigoted as the Patháns; and the influence of Sunni Pathán Governors has induced the bulk of the mixed Jat population to follow that persuasion. In Jhang, where the Shíah sect is numerous, they are said to be—"of the most bigoted type. They keep the Muharram most strictly, fasting for "ten days, accompanying the *táziahs* bare-headed and barefooted, and allowing neither Hindu nor Musal-"mán to approach without baring his head and removing his shoes." Saiyads, being descendants of Ali, should be Shíahs by heredity. But in the western districts where they are most numerous, they profess for the most part the Sunni doctrines lest they should alienate the disciples upon whose offerings they depend for subsistence, though, except on the border itself, they habitually make and follow *táziahs*.

286. The Wahhabi sect.—Muhammad, son of Abdul Wahháb, and the founder of the Wahhábi sect[2], was born in Nejd in 1691 A.D., and was an Arab of the Tumín tribe. His doctrines rapidly spread among the Bedouin tribes, and his successors reduced the whole of Nejd, defeated the forces of the Baghdad Pasha, plundered Kerbela, took the holy cities of Mecca and Medina, and subdued the entire Hijáz. In 1809 the Bombay Government, enraged at their piracies, sent an expedition to the Persian Gulf and captured their stronghold on the Kirman coast. In 1811-18 the Sultán of Turkey attacked them because, denying the existence of a visible Imám, they refused to recognise his spiritual authority, captured and beheaded their chief, and reduced them to political insignificance. Their doctrines were introduced into India by one Saiyad Ahmad Sháh of Rai Bareilly, who began life as a freebooter, but turning his attention to religion visited Arabia not long after the events just described, and returning to India spread the new tenets. Having collected a numerous following he proceeded to the Pathán frontier, and there proclaimed, in 1826, a Jihád or religious war against the Sikhs[3]. The extraordinary ascendancy that he obtained over the wild tribes of the Pesháwar border, the four years' struggle which he waged, not unsuccessfully, with the Durráni on the one hand and the Sikhs on the other, and his ultimate defeat and death, are fully described by Major James at pages 43 to 47 of his Pesháwar Report, and still more fully by Dr. Bellew in his History of Yúsufzai, pages 83 to 102. The Wahhábi doctrines seem to have found much favour with the lower classes in Bengal, and Patna is now the head-quarters of the sect in India. There are also Wahhábi colonies at Polosi on the Indus, and at Sittána and Mulkah in independent Yúsufzai beyond Buner.

But these men call themselves Mujáhidín, or promoters of the Jihád or sacred war; and indeed the whole sect as found in the Panjáb reject the name of Wahhábi as a term of reproach, and as now having a political stigma attached to it, and prefer to call themselves *Ahl-i-Hadís*, "People of the traditions," or *Muwahidín*, "Unitarians;" while in the eastern districts (though not apparently on the frontier) they commonly style themselves *Muhammadí*, substituting the personal name of their founder Muhammad ibn Abdul Wahháb for his patronymic. In fact it is almost certain that a very large proportion of those who hold the Wahhábi doctrines in the Panjáb have returned themselves by some one of these names, and are therefore not shown as Wahhábis in our tables. The district officers note that the Census figures very inadequately represent the numbers of the sect in Hushyárpur, Amritsar[4], Lahore, Derah Ismáil Khán, and Pesháwar.

287. The Wahhábis are Musalmán purists. They accept the six books of traditions as collected by the Sunnis, but reject the subsequent glosses of the fathers and the voice of the Church, and claim liberty of conscience and the right of private interpretation. They insist strongly upon the unity of God, which doctrine they say has been endangered by the reverence paid by the ordinary Musalmán to Mahomet, to the Imáms, and to saints, and forbid the offering of prayer to any prophet, priest, or saint, even as a

[1] The above account is taken from Major James' Report on Pesháwar, pages 30 to 33, where further particulars will be found.

[2] Much of the following account is taken from the Rev. Mr. Hughes' *Notes on Muhammadanism* and from letters in which that gentleman has most kindly answered questions put by me.

[3] Mr. Stobart states that Saiyad Ahmad was born in 1706. That would make him 120 years old when he first went to war, and I suspect it must be a misprint for 1786.

[4] See below, section 287.

Part II.—The Biloch, Pathan, and Allied Races.

conquered the tract between Jalálábád and Kelát-i-Ghilzai, and spread east and west over the country they now hold. In the beginning of the 18th century they revolted against their Persian rulers, established themselves under Mír Wais as independent rulers at Kandahár, and overran Persia. But a quarter of a century later they were reduced by Nádir Sháh, and their rule disappeared, to be succeeded not long after by that of the Durráni.

With the remaining races of the Tájik and Hazára which form part of the Pathán nation in its widest sense, we have little concern in the Panjáb. The former are the remnants of the old Persian inhabitants of Afghánistán, and the word is now loosely used to express all Pathán who speak Persian and are neither true Afgháns, Saiyads, nor Hazáras. They are scattered through Afghánistán, Persia, and Túrkistán, in which last they hold some hill fastnesses in independent sovereignty. The Hazáras are Tartar by origin, and are supposed to have accompanied Chengiz Khán in his invasion. They occupy all the mountain country formed by the western extensions of the Hindu Kush between Ghazni, Balkh, Hirát, and Kandahár. I have included in my account of the Pathán a few allied races, who though not usually acknowledged as Pathán, have by long association become closely assimilated with them in manners, customs, and character. They chiefly occupy Hazára, and are called Dilazák, Swáti, Jadún, Tanáoli, and Shilmáni.

397. Tribal affinities and statistics.—The Pathán genealogies, which were probably concocted not more than 400 years ago, teem with obvious absurdities. But they are based upon the existing affinities of the people whom they trace back to Kais; and they will therefore afford a useful basis for a discussion of the tribes with which we in the Panjáb are concerned. I give in Abstract No. 69 on pages 204 and 205 a table showing the traditional grouping of the divisions of the Pathán nation. This grouping corresponds fairly well with their present distribution by locality, and I shall therefore take the tribes in order as they lie along our border, beginning from the south where they march with the Biloches. Unfortunately the figured details for the various tribes which I give in Abstract No. 70, on page 206 are in many ways unsatisfactory. I have already explained that the Deputy Commissioners of the frontier districts were asked to prepare lists of the tribes for which figures should be separately tabulated for each district, and it is now apparent that these lists were drawn up far more with regard to the political needs of each district than with reference to any ethnic or tribal system of classification. The figures given, however, will probably satisfy all administrative requirements; though they are so full of double or incomplete classification that they are of little use to me in the description of the tribes, and I have hardly alluded to them in the following pages. I have however grouped the figures on the basis of the tribal classification adopted in Abstract No. 69, and have added below each heading in Abstract No. 70 the serial numbers of the tribes shown in Abstract No. 69 which it may be considered to include, so that the information contained in the figures is connected as closely as possible with the grouping of the tribes which I have followed. The figures being tabulated on the spot by a local staff are probably as accurate as the material will permit of. But errors must have occurred, both from the constant recurrence of the same clan name in different tribes, and from the difficulty pointed out in the following quotation from Mr. Beckett's Peshawar Census Report:—

"Among Muhammadans, especially among Afgháns, tribes or sections multiply with generations; for instance as the descend-
"ants increase their branches or sections increase with them, so the mistake which has occurred is that, of a few men whose origin was
"the same, some were placed under the name of the old ancestor of the family, some under the name of an intermediate ancestor, and
"others under the name of a more modern or lower geueration. Similarly those who should have been entered under the original
"branch were shown under numerous branches."

398. Pathan tribes of Derah Ismail Khan.—The tribes of our lower frontier belong almost exclusively to the lineage of Shekh Baitan[1], third son of Kais. His descendants in the male line are known as Bitanni, and are comparatively unimportant. But while, in the early part of the 8th century, Baitan was living in his original home on the western slopes of the Siáh-band range of the Ghor mountains, a prince of Persian origin flying before the Arab invaders took refuge with him, and there seduced and married his daughter Bíbi Matto. From him are descended the Matti section of the nation, which embraces the Ghilzai, Lodi, and Sarwáni Pathán. The Ghilzai were the most famous of all the Afghán tribes till the rise of the Durráni power, while the Lodi section gave to Dehli the Lodi and Súr dynasties. The Sarwáni never rose to prominence, and are now hardly known in Afghánistán. To the Ghilzai and Lodi, and especially to the former, belong almost all the tribes of warrior traders who are included under the term *Pawindah*, from *parwindah*, the Persian word for a bale of goods or, perhaps more probably, from the same root as *powal*, a Pashto word for "to graze."[2] They are almost wholly engaged in the carrying trade between India and Afghánistán and the Northern States of Central Asia, a trade which is almost entirely in their hands. They assemble every autumn in the plains east of Ghazni, with their families, flocks, herds, and long strings of camels laden with the goods of Bukhára and Kandahár; and forming enormous caravans numbering many thousands, march in military order through the Kákar and Wazíri country to the Gomal and Zhob passes through the Sulemáns. Entering the Derah Ismáíl Khán district, they leave their families, flocks, and some two-thirds of their fighting men in the great grazing grounds which lie on either side of the Indus, and while some wander off in search of employment, others pass on with their laden camels and merchandise to Multán, Rájpútána, Lahore, Amritsar, Dehli, Cawnpore, Benares, and even Patna. In the spring they again assemble, and return by the same route to their homes in the hills about Ghazni and Kelát-i-Ghilzai. When the hot weather begins the men, leaving their belongings behind them, move off to Kandahár, Hirát, and Bukhára with the Indian and European merchandize which they have brought from Hindústán. In October they return and prepare to start once more for India. In 1877 the number of these traders which passed into the district of Derah Ismáíl Khán was 76,400, of which nearly half were grown men. In the year of the Census, the number was 49,392. These Pawindah tribes speak the soft or western Pashto, and have little connection with the settled tribes of the same stock[3].

[1] Dr. Bellew points out that Baitan has an Indian sound; while Shekh is the title given, in contradistinction to Saiyad, to Indian converts in Afghánistán. Thus the Ghilzai (the Túrk term for swordsman) are probably of Túrk extraction, with Indian and Persian admixtures.

[2] The pronunciation is Powindah, rather than Pawindah.

[3] The *Pawindahs* are well described at pages 103*ff* of Dr. Bellew's *Races of Afghánistán*, and at pages 18*ff* of Priestley's translation of the *Haiyát-i-Afgháni*, while Mr. Tucker gives much detailed information concerning them at pages 184 *ff* of his Settlement Report of Derah Ismáíl Khán.

Abstract No. 69 *showing the* Principal Divisions *of the* Pathán Nation.

Serial No.	Origin, and natural Divisions and Affinities.		Tribal Divisions.						Serial No.	Notes.	Present Holdings.	Country, district, or frontier to which each tribe appertains.	Sections of the report in which each tribe is described.	Serial No.
1						Sarwáni.		Sarwáni	1	No longer found in Afghánistán. Maler Kotla family belongs to the Sarípál clan	Scattered through Hindústán	Hindústán.	398-9	1
2	Doubtful.				Khasor			Khasor	2	A small tribe of doubtful origin	Trans-Indus Salt Range of Derah Ismáíl Khán	D. I. Khán.	399-402	2
3					Sláni.	Práng		Prángi	3	Gave Lodi dynasty to Dehli	Migrated to Hindústán. Scattered through Hindústán	Hindústán.	399	3
4							Súr.	Súr	4	Gave Súr dynasty to Dehli			398-9	4
5	Doubtful.					Ismáíl.		Ítor	5	Insignificant, since crushed by Nádir Sháh	Tánk in Derah Ismáíl Khán	Derah Ismáíl Khán District.	401	5
6							Lohání.	Balúch	6	Small, and of uncertain origin. Affiliated to No. 7	Derah Ismáíl Khán Salt Range and cis-Indus plain		399-402	6
7								Daulat Khel	7	A sept of the Mámú Khel, to the whole of which it has given its name. Rulers of Tánk are of the Katti Khel sept.	Part of Tánk in Derah Ismáíl Khán		401	7
8	Saiyad.							Mián Khel	8	Often held to include Bakhtiár, No. 9	The central part of trans-Indus Derah Ismáíl Khán		401-2	8
9								Bakhtiár (a)	9	A Saiyad tribe from Persia, affiliated to No. 8. See also No. 29			401	9
10								Marwat	10	Known as Spín Lohání, Nos. 5 to 9 being called Túr Lohání	South-west portion of Bannu district	Bannu.	404	10
11					Niázi			Niázi (proper)	11	Chief clans, Isákhel, Sarhang, Mushání	Both banks of Indus in north of Bannu		403	11
12								Kundi	12	The Niázi descent not always admitted	Part of Tánk in Derah Ismáíl Khán		402	12
13					Dutanni			Dutanni	13	Unimportant			402	13
14				Lodi.	Ghilzai (proper).	Turán		Hotak	14	Gave the Ghilzai kings to Kandahár. Crushed by Nádir Sháh	*Pawíndah* tribes with homes in the Ghilzai country, between Jaláiábád and Kelát-i-Ghilzai. Their families spend the winter there, and the summer in the Derah Ismáíl Khán plains. For a description of the *Pawíndah* traffic, see Section 398.	Derah Ismáíl Khán District.	402	14
15								Tokhi	15	Once the principal Ghilzai tribe			402	15
16	Doubtful.							Násar	16	Their Ghilzai origin is doubtful			402	16
17								Kharoti	17	Their Ghilzai origin is doubtful			402	17
18						Ibráhímzai		Suleimán Khel	18	Now the principal Ghilzai tribe			402	18
19								Ali Khel	19	Unimportant				19
20								Aka Khel	20	Unimportant				20
21								Isháq	21	Chief clan is Yúsuf Khel				21
22								Andar	22	The Músa Khel Kákar are affiliated to this tribe			402	22
23	A Turk stock (Khilchi or Ghilzai) combined with Persian blood; the two fused together under a traditional descent from a Persian father and an Afghan mother.	The Ghilzai proper, combined with tribes of Persian origin, in the male line at least, all claiming descent from the Pathan progenitor Kais.	Baitani Pathans, descended from Baitan, son of Kais.	Matti tribe, descended from Shah Husen, a Persian prince.	By Bibi Matto, daughter of Baitan.				23				402	23
24					Bitanni.			Bitanni	24	Clans Warshpún and Kajín (septs Dhanne and Tatte)	North-west of Derah Ismáíl Khán	Derah Ismáíl Khán District.	401	24
25	Sarbanni Afghán, affiliated with the Pathans.				Kákar and affiliated tribes.	Shiráni and affiliated tribes.	Shiráni	Shiráni (proper)	25	Descended from Sharkabún by a Kákar mother. Shiráni quarrelled with his brothers, and allied himself to the Kákar branch of the Ghurghusht section, with which his descendants are still associated. See No. 86	Country round and west of the Takht-i-Suleimán on the Derah Ismáíl Khán border.		402	25
26								Haripái	26				402	26
27								Jalwáni	27				402	27
28								Bábar	28		South of Derah Ismáíl Khán, and adjoining parts of Suleimán mountains.		401	28
29	Saiyad origin.						Saiyad tribes affiliated to Shiráni. Bakhtiár.	Bakhtiár (b)	29	Saiyad tribes affiliated to the Shiráni. No. 31 includes several clans of true Pathán origin	*Pawíndah* tribe in the Ghilzai country		401	29
30							Ushtaráni.	Ushtaráni (proper)	30		South-west of Derah Ismáíl Khán		401	30
31								Gandápur	31		North-west of Derah Ismáíl Khán		401	31
32	Probably Scythic.					Kákar		Kákar proper	32	Bellew allies the Kákar to the Gakkhars. They include several clans of distinct origin, all called Kákar after the chief tribe	Kákaristán in south-east of Afghánistán, between the Ghilzai, Spín Tarín, and Biloch territories and the Suleimán mountains.	Afghánistán.	396	32
33								Bábe Khel	33				-	3
34								Mandu Khel	34					
35	Rájpút, old Indian.							Panni	35	Of Rájpút origin. The larger portion of them is still settled in Shekháwatti and Haidarábád			412	
36								Nághar	36					
37								Dádi or Khundi	37	The representatives of the ancient Dadicæ			396	
38	Doubtful.	The Kakar, a Scythic stock, with affiliated tribes of Indian origin.	Ghurghusht, son of Kais.			Wazíri		Lálai	38	Ancestor separated from his brother through a feud	Northern slopes of Western Safed Koh		405	
39								Mahsúd	39	Chief clans Alízai and Bahlolzai	Hills on north-west frontier of Derah Ismáíl Khán	Bannu and Dera Ismáíl Khán border.	4	
40								Gurbuz	40	Unimportant. Practically a separate tribe				
41								Darvesh Khel	41	Chief clan Utmánzai and Ahmadzai	Hills on the Bannu border			
42						Shitak married Musammát Bannu.		Bannúchi	42	Hybrid tribe, with many clans of mixed origin	North-west of Bannu district			
43								Daur	43	Unimportant	Both banks of River Tochi on Bannu border			
44	Doubtful.	admixture of Turk tribes.						Tane	44	Pathán origin doubtful	South-west corner of Khost			

(Dodiera), three of the four Pactyan nations of Herodotus; but with a very large admixture of tions of Jats and Scyths in 5th and 6th centuries, the former by Sabuktagin and Changiz in end

Part II.—The Biloch, Pathan, and Allied Races.

399. It is not to be wondered at that these warlike tribes cast covetous eyes on the rich plains of the Indus, held as they were by a peaceful Jat population. Early in the 13th century, about the time of Shahâb-ud-dín Ghori, the Prángi and Súr tribes of the Lodi branch, with their kinsmen the Sarwáni, settled in the northern part of the district immediately under the Sulemáns, the Prángi and Súr holding Tánk and Rori, while the Sarwáni settled south of the Lúni in Drában and Chandhwán. With them came the Balúch, Khasor, and other tribes who occupied the branch of the Salt-range which runs along the right bank of the river, and still hold their original location. In the early part of the 15th century the Niázi, another Lodi tribe, followed their kinsmen from Ghazni into Tánk, where they lived quietly as *Pawindahs* for nearly a century, when they crossed the trans-Indus Salt-range and settled in the country now held by the Marwat in the south of the Bannu district, then almost uninhabited save by a sprinkling of pastoral Jats, where Bábar mentions them as cultivators in 1505.

During the reign of the Lodi and Súr Sultáns of Dehli (1450 to 1555 A.D.), the Prángi and Súr tribes from which these dynasties sprang, and their neighbours the Niázi, seem to have migrated almost bodily from Afghánistán into Hindústán, where the Niázi rose to great power, one of their tribe being Súbahdár of Lahore. These last waxed insolent and revolted in alliance with the Gakkhars, and in 1547 Sultán Salím Sháh Súri crushed the rebellion, and with it the tribe. At any rate, when in the early days of Akbar's reign the Lohání, another Lodi tribe, who had been expelled by the Sulemán Khel Ghilzai from their homes in Katawáz in the Ghazni mountains, crossed the Sulemáns, the Lodi tribes were too weak to resist them; and they expelled the remaining Prángi and Súr from Tánk, killing many, while the remainder fled into Hindústán. The Lohání are divided into four great tribes, the Marwat, Daulat Khel [1], Mián Khel, and Tátor [2]. About the beginning of the 17th century the Daulat Khel quarrelled with the Marwats and Mián Khel and drove them out of Tánk. The Marwats moved northwards across the Salt-range and drove the Niázi eastwards across the Kurram and Salt-range into Isa Khel on the banks of the Indus, where they found a mixed Awán and Jat population, expelled the former, and reduced the latter to servitude. The Mián Khel passed southward across the Lúni river and, with the assistance of the Bakhtiár, a small Persian tribe of Ispahán origin who had became associated with them in their nomad life [3], drove the Sarwáni, already weakened by feuds with the Súr, out of their country into Hindústán. In this quarrel the Daulat Khel were assisted by the Gandápur, a Saiyad tribe of Ushtaráni stock (see next paragraph); and the latter were settled by them at Rori and gradually spread over their present country.

400. The Shiráni Afgháns had been settled from of old in the mountains about the Takht-i-Sulemán. They are by descent Sarbani Afgháns; but their ancestor, having quarrelled with his brothers, left them and joined the Kákar from whom his mother had come; and his descendants are now classed as Ghurghushti and not as Sarbani. About the time that the Lohání came into the district, the Bábar, a Shiráni tribe, descended from the hills into the plains below and subjugated the Jat and Biloch population. Finally, about a century ago, the Ushtaráni proper, a Saiyad tribe affiliated to the Shiráni Afgháns, having quarrelled with the Músa Khel, acquired a good deal of the plain country below the hills at the foot of which they still live, subjugating the Biloch inhabitants and encroaching northwards upon the Bábar. These are the most recently located of the trans-Indus tribes of Derah Ismáil Khán. Thus the Pathán hold a broad strip of the trans-Indus portion of the district, running northwards from the border of the Khetrán and Qasráni Biloches (see section 383) along the foot of the hills and including the western half of the plain country between them and the Indus, and turning eastwards below the Salt-range to the river. They also hold the trans-Indus Salt-range, and the Sulemáns as far south as the Biloch border. But while in the extreme northern portion of the tract the population is almost exclusively Pathán, the proportion lessens southwards, the Pathán holding only the superior property in the land, which is cultivated by a subject population of Jat and Biloch. Beyond the Indus the Balúch who hold the north of the Bhakkar *thal* are the only Pathán tribe of importance. Their head-quarters are at Paniála in the trans-Indus Salt-range, and they seem to have spread across the river below Miánwáli, and then to have turned southwards down the left bank. Although living at a distance from the frontier, they still talk Pashto and are fairly pure Pathán. The other Pathán of the Khasor hills, though trans-Indus, are, like all the cis-Indus Pathán, so much intermixed with Jats as to have forgotten their native tongue. The Mián Khel and Gandápur were deprived of many of their eastern villages in the beginning of this century by Nawáb Muhammad Khán Saddozai, Governor of Leiah.

401. The Pathan tribes of Derah Ismail Khan continued.—I now proceed to give a brief description of the various tribes, beginning from the south:—

The Ushtarani.—The Ushtaráni proper are the descendants of Hannar one of the sons of Ustaryáni, a Saiyad who settled among and married into the Shiráni section of Afgháns, and whose progeny are shown in the margin. They were settled with the Shirânis to the south of the Takht-i-Sulemán, and till about a century ago they were wholly pastoral and *pawindah*. But a quarrel with their neighbours the Músa Khel put a stop to their annual westward migration, and they were forced to take to agriculture. Their descent into the plains has been described in section 400. They still own a large tract of hill country, in which indeed most of them live, cultivating land immediately under the hills and pasturing their flocks beyond the border. Their territory only includes the eastern slopes of the Sulemáns, the crest of the range being held by the Músa Khel and Zmari. They are divided into two main clans, the Ahmadzai or Amazai and the Gagalzai, and these again into numerous septs. They are a fine manly race, many of them are in our army and police, and they are quiet and well behaved, cultivating largely with their own hands. A few of them are still *pawindahs*. They are much harassed by the independent Bozdár (Biloch). They are all Sunnis. The boundary between the Ushtaráni and Bábar was originally the Ramak stream. But in a war between them the former drove the latter back beyond the Shirvan stream which now forms their common boundary.

Ustaryáni .	Hannar . .	Ushtaráni.	
	Amarkhel . .	Gandápur.	
	Gandápur . .		
	Marere . .		
	Shekhi . .		

The Babar are a tribe of the Shiráni stock whose affinities have been described in section 400, though they are now quite

[1] The Daulat Khel is really only a clan of the Mámu Khel tribe; but it has become so prominent as practically to absorb the other clans, and to give its name to the whole tribe.

[2] Wrongly spelt Játor throughout Mr. Tucker's settlement report.

[3] They are a section of the Bakhtiári of Persia. They first settled with the Shiráni Afgháns; and a section now lives at Margha in the Ghilzai country, and is engaged in the *pawindah* trade, but has little or no connection with the Bakhtiár of Derah Ismáil.

Part II.—The Bilúch, Pathán, and Allied Races.

409. Meanwhile the Ghoria Khel whom they had left behind in the Kandahár country had been following in their track, and early in the 16th century they reached the western mouth of the Khaibar pass. Here they seem to have divided, a part of the Mohmand now known as the Bar Mohmand crossing the Kábul river at Dakka, while the remainder went on through the pass to the plain of Pesháwar lately vacated by the Yúsufzai, where they defeated the Dilazák in a battle close to Pesháwar, drove them across the Kábul river into what are now called the Yúsufzai plains, and occupied all the flat country south of the Kábul river and west of Jalozai. This they still hold, the Dáudzai holding the right bank of the Kábul river, and the Khalil the left bank of the Bára river and the border strip between the two streams facing the Khaibar pass, while the Mohmand took the country south of the Bára and along the right bank of the Kábul as far as Naushahra, though they have since lost the south-eastern portion of it to the Khatak. Meanwhile the Bar Mohmand made themselves masters of the hill country lying north of the Kábul river as far up as Lálpura and west of the Doába, and possessed themselves of their ancestral capital Gandhára, driving out into Káfiristán the inhabitants, who were probably their ancient kinsmen, the descendants of such Gandhári as had not accompanied them when, two centuries earlier, they had migrated to Kandahár. They then crossed the Kábul river, and possessed themselves of the country between its right bank and the crest of the Afridi hills to the north of the Khaibar pass.

While these events were occurring, the Gugiáni, Tarkláni[1], and Muhammadzai, who had been left behind in Ningrahár, moved eastwards, whether driven before them by the advancing Ghoria Khel, or called in as allies against the Dilazák by the Yúsufzai. At any rate they joined their friends in Doába and Hashtnaghar, and attacking the Dilazák, drove them out of Yúsufzai and across the Indus. They then divided their old and new possessions among the allies, the Gugiáni receiving Doába, the Muhammadzai Hashtnaghar, while the Yúsufzai, Utmán Khel, and Tarkláni took the great Yúsufzai plain. During the next twenty years these three tribes made themselves masters of all the hill country along the Yúsufzai, Hashtnaghar, and Bar Mohmand border, from the Indus to the range separating the Kunar and Bajaur valleys, the inhabitants of which, again the ancient Gandhári who had already suffered at the hands of the Bar Mohmand, they drove east and west across the Indus into Hazára and across the Kurram into Káfiristán. This country also they divided, the Tarkláni taking Bajaur, and the Utmán Khel the valley of the Swát river up to Arang Bárang and its junction with the Panjkora, while the Yúsufzai held all the hills to the east as far as the Indus and bordering upon their plain country, including lower Swát, Buner, and Chamlah. Some time later the Khatak obtained from Akbar, as has already been related in section 406, a grant of the plains in the south-east of the Pesháwar district. Thus the Khakhai and their allies held all the country north of the Kábul river from the Indus to Kunar, including the hills north of the Pesháwar border, but excluding those lying west of Doába which were occupied by the Bar Mohmand; while all the plain country south of the Kábul was held, in the east by the Khatak, and in the west by the Ghoria Khel. These last attempted to cross the river into Yúsufzai, but were signally defeated by the Yúsufzai, and have never extended their dominions. How the Khatak pushed across into the Yúsufzai plain has already been told (section 406). The Dilazák, thus expelled from their territory, made incessant efforts to recover it; until finally, as the cause of tumult and disorder, they were deported *en masse* by the Emperor Jahángír and scattered over the Indian peninsula. When the Yúsufzai settled in their possessions they divided the hill and plain country equally between their two great sections, the Mandanr and the Yúsufzai proper. But feuds sprang up amongst them which were fomented by the Mughal rulers; and early in the 17th century the Yúsufzai expelled the Mandanr from Swát and Buner, while the Mandanr in their turn expelled the Yúsufzai from the greater part of the Yúsufzai plain. Thus the Yúsufzai now hold Swát, Buner, and the Lundkhwár and Ránizai valleys in the north-west of Yúsufzai; while the Mandanr hold Chamlah and the remainder of the plain country.

410. **The Pathan tribes of Peshawar continued.—The Plain Mohmand.**—I now proceed to describe the tribes in detail. Passing from Kohát into Pesháwar through the country of the Khatak, who have already been described in section 407, and turning west, we first come to the lower or Plain Mohmand, who occupy the south-west corner of the district, south of the Bára stream. They are divided into five main sections, the Marúzai, Mámanai, Dawezai, Matanni, and Sargani. Their headmen, in common with those of all the Ghoria Khel, are called *Arbáb*, a title meaning master, and conferred by the Mughal Emperors[2]. They are good and industrious cultivators, and peacefully disposed except on the Afridi border. Their relation with the Bar Mohmand, from whom they are now quite separate, differing from them in both manners and customs, is described in section 409.

The Khalil occupy the left bank of the Bára, and the country along the front of the Khaibar pass. They have four main clans, Mutázai, Bírozai, Ishákzai, and Tiharzai, of which the Bírozai is the most powerful. They are not good cultivators. There are some of the tribe still to be found in Kandahár.

The Daudzai occupy the left bank of the Kábul river as far down as the junction of the Bára. The Mohmand and Dáudzai are descended from a common ancestor Daulatyár, son of Ghorzi the progenitor of the Ghoria Khel. Dáúd had three sons, Mandkai, Mámár, and Yúsuf, from whom are descended the main sections of the tribe. Mandkai had three sons, Hasan, Nekai, and Bábo, of whom only the first is represented in Pesháwar. Nekai fled into Hindústán, while Bábo's few descendants live in parts of Tírah.

The Gugiani hold the Doába or plain country in the angle between the Kábul and Swát rivers. They are descended from Mak, the son of Khakhai, by a *kamaidan* shepherd who married Mak's daughter Gugi, whence the name. They are divided into two great sections, Hotak and Zirak. Macgregor says that other Pathán do not recognise them as of pure Pathán blood.

The Muhammadzai[3] hold Hashtnaghar, a strip of territory some 13 miles broad running down the left bank of the Swát river from our border to Naushahra. They are descended from Muhammad, one of the sons of Razmand; and with them are settled a few descendants of his brethren, from one of whom, Khushgi, one of their principal villages is named. Their clans are Pring, Chármadda, Bazar, Utmánzai, Turangzai, Umarzai, Sherpao, and Tangi with its two septs Barazai and Nasratzai.

The Baizai.—The Yúsufzai proper are divided into the Bádi Khel (now extinct) Isázai, Ilázai, Malizai, and Akozai. The Akozai are further divided into three clans, the Ránizai[4] who hold the western portion of the hills between Yúsufzai and Swát, the Khwájozai who occupy the country between the Swát and Panjkora rivers, and the Baizai. The last originally held the Lundkhwár valley in the centre of the northernmost portion of the Pesháwar district, and all the eastern hill country between that and the Swát river. The hills they still hold; but the Khatak have[5], as already recounted in section 406, obtained all the western portion

[1] A section of the Tarkláni remained in Laghmán, where they still dwell.
[2] Arbáb is the plural of the Arabic *Rab* or Lord; a term often applied to the Deity.
[3] The tribe is often called Mohmandzai or Mámanzai, and their ancestor, Mohmand or Mámo.
[4] The *Majmú-i-Afgháni* calls the Ránizai a sept of the Baizai. This seems improbable, as they descend from different wives of Ako.
[5] Some say that the Khatak, as well as the Utmán Khel, were called in as allies against the Ránizai.

Downloaded by Abdul Alam International Institute of Information Technology, Hyderabad on 09 Sep 2017 at 02:18:00

Part II.—The Biloch, Pathan, and Allied Races.

of the valley, while the Utmán Khel Karlánri, whom the Baizai called in as allies in a feud with their neighbours and kinsmen the Ránizai, have obtained its north-east corner, and the Baizai now hold only a small tract to the south of these last. They are divided into six septs, Abba Khel, Aziz Khel, Bábozai, Matorezai, Músa Khel, and Zangi Khel. The last lies south of the Ilam range which divides Swát from Buner. The other five originally held the Baizai valley and the hills to the north; but since the irruption of the Khatak and Utmán Khel, only the first three hold land in our territory.

The Mandanr hold the remainder of the Pesháwar district. They are divided into main clans as follows:—

- Mandanr
  - Usmánzai
    - Kamálzai
      - Mishránzai.
      - Kishránzai.
    - Amázai
      - Daulatzai.
      - Ismáilzai.
  - Utmánzai
    - Alízai.
    - Kanázai.
    - Akázai.
  - Saddozai.
  - Razar
    - Mánezai.
    - Malakzai.
    - Ako Khel.
    - Khidrzai.
    - Mámúzai.

The Saddozai are by origin a branch of the Utmánzai by a second wife of Utmán, but they are practically separated from them. The Usmánzai occupy all the northern and western portions of the Mandanr tract, the Kamálzai lying to the west immediately south of the Londkhwár valley and stretching as far down as the border of the Buláq Khatak, while the Amázai lie to the east and south-east of the same valley. Of the septs, the Kishránzai, who hold Hoti and Mardán, and the Daulatzai lie to the north, and the Mishránzai and the Ismáilzai to the south of the respective tracts. South of the Amázai, and between them and the Khatak territory, come the Razar; while the Utmánzai and Saddozai hold the extreme east of the district on the right bank of the Indus, the Saddozai lying to the west and the Utmánzai to the east. These latter also hold a small area in the south of the independent Gadún valley, and early in the 18th century were called across the Indus by the Gújars of Hazára as allies against the Tarín Afgháns, and appropriated the Gandgarh tract from Torbela to the southern border of Hazára. In this tract all three of their main septs are represented, the Tarkheli section of the Alízai holding the southern half of the tract, and stretching across the border into Attak. The Khudu Khel, a Saddozai sept, occupy the valleys between Chamlah and the Gadún country. The valley of Chamlah, on the Pesháwar border and north of the Gadún country, is occupied by a mixture of Mandanr clans, in which the Amázai, whose Ismáilzai sept hold the Mahában country, largely preponderate. The Mandanr, living almost wholly within our territory and long subject to the rulers of Pesháwar, are perhaps more civilised and less impatient of control than any other Pathán tribe.

411. **The Pathan tribes of the Peshawar border. The Afridi.**—Dr. Bellew says that the Afridi, whom he identifies with the Aparytæ of Herodotus, originally held the whole of the Safed Koh system between the Kábul and the Kurram river, from the Indus to the headwaters of the Kurram and the Pewár ridge. But since the great Scythic invasions of the 5th and succeeding centuries, they have been successively encroached upon by tribes of very diverse origin; first by the Orakzai and Bangash to the south, and later by the Wazíri and Túri to the south-west, the Khatak to the east, and the Ghilzai, Khugiáni, and Shinwári to the west. They now hold only the central fastnesses of the eastern extremity of the Safed Koh; namely, the Khaibar mountains, the valley of the Bára and the range south of that valley which separates Kohát from Pesháwar, and the northern parts of Tíráh, which they recovered from the Orakzai in the time of Jahángír. The Pathán historians trace their descent from Burhán son of Kakai, grandson of Karlánri, by his son Usmán surnamed Afridi, and say that in the 7th century the Khaibar tract was held by Rájpúts of the Bhatti tribe and Yádúbansi stock, subjects of the Rája of Lahore, who were constantly harassed by the Afgháns of Ghor and the Sulemáns; and that about the end of the century the Afridi, then in alliance with the Gakkhars, obtained from the Lahore Government all the hill country west of the Indus and south of the Kábul river on condition of guarding the frontier against invasion. The Afridi are divided into five clans, of which the Ula Khel and in it the Zakha Khel sept is the largest, while the Mita Khel are no longer to be found in Afghánistán and the Miri Khel have been amalgamated with the Malikdín and Aka Khel. Some of the principal divisions are shown below:—

1. Mita Khel.
2. Miri Khel.
3. *Aka Khel*
   - Bassi Khel.
   - Madda Khel.
   - Sultán Khel.
   - Miro Khel.
4. Ula Khel (Khaibar Afridi).
   - Maimana Khel
     - Firoz Khel
       - *Kúki Khel.*
       - *Kamar Khel.*
     - Mír Ahmad Khel
       - *Malikdín Khel.*
       - *Qambar Khel.*
     - *Sepáh.*
   - *Zakha Khel.*
5. *Adam Khel*
   - Hasan Khel.
   - Jawáki.
   - Galli.
   - Ashu Khel.

But for practical purposes they are divided at present into eight clans, *viz.*, Kúki Khel, Malikdín Khel, Qambar Khel, Kamar Khel, Zakha Khel, Aka Khel, Sepáh, and Adam Khel, whose names are printed in italics in the above table.

The Adam Khel, who include the Hasan Khel and Jawáki septs so well known on our border, occupy the range between Kohát and Pesháwar, from Akor west of the Kohát pass to the Khatak boundary. The Hasan Khel hold the land along the southern border of the Pesháwar and the north-eastern border of the Kohát district. Next to them come the Aka Khel who hold the low range of hills from Akor to the Bára river, the Bassi Khel sept lying nearest to British territory. These two clans occupy the south-eastern corner of the Afridi country, and lead a more settled life than their kinsmen, being largely engaged in the carriage of wood and salt between Independent Territory and British India. The other tribes are in some degree migratory, wintering in the lower hills and valleys, while in the hot weather they retire to the cool recesses of the upper mountains. But their general distribution is as follows: North of the Bára river is the Kajúri plain, which forms the winter quarters of the Malikdín Khel, Qambar Khel, Sepáh, and Kamar Khel. The Qambar Khel pass the summer in Tírah. The Sepáh's summer quarters are in the Bára valley; while the Kamar Khel spend the hot months in the spurs of the Safed Koh between Maidán and Bára, and are better cultivators and graziers and less habitual robbers than their kinsmen. The Zakha Khel are the most wild and lawless of the Afridi clans. Their upper settlements are in the Maidán and Bára districts, and their winter quarters lie in the Bazár valley north of Landi Kotal, and in the Khaibar from Ali Masjid to Landi Kotal. Their children are christened by being passed backwards and forwards through a hole made in a wall after the fashion of a burglar, while the parents repeat "Be a thief; be a thief" an exhortation which they comply with scrupulously when they arrive at years of discretion. They are notorious as liars and thieves, even among the lying and thieving Afridi. The Kúki Khel hold the eastern mouth of the Khaibar, and the pass itself as far as Ali Masjid. In summer they retire to the glen of Rájgal, north of Maidán, in the Safed Koh. They trade in firewood, and offend rather by harbouring criminals than by overt acts of aggression. The Afridi is the most barbarous of all the tribes of our border. All the Karlánri, with the single exception of the Khatak, are wild and uncontrollable; but most of all the Afridi. "Ruthless cowardly robbery and cold-blooded treacherous murder are to an Afridi the salt of life. Brought up from earliest childhood amid scenes of appalling treachery and merciless revenge, nothing has yet changed him: as he lives, a shameless cruel savage, so he dies. Yet he is reputed brave, and

Part II.—The Biloch, Pathan, and Allied Races.

that by men who have seen him fighting; and he is on the whole the finest of the Pathán races of our border. His physique is exceptionally fine, and he is really braver, more open and more treacherous than other Patháns. This much is certain, that he has the power of prejudicing Englishmen in his favour; and few are brought into contact with him who do not at least begin with enthusiastic admiration for his manliness"[1]. He is tall, spare, wiry, and athletic; hardy and active, but impatient of heat. His women are notoriously unchaste. He is only nominally a Musalmán, being wholly ignorant and intensely superstitious. The Zakha Khel removed the odium under which they suffered of possessing no shrine at which to worship, by inducing a sainted man of the Káka Khel to come and settle among them, and then murdering him in order to bury his corpse and thus acquire a holy place of their own. The Afrídi are intensely democratic, the nominal Chiefs having but little power.

The Mullagori.—North of the Afrídi come the Mullágori, a small and inoffensive tribe who are associated with the hill Mohmand, but whose Pathán origin is doubtful. They hold the Tartarah country north of the Khaibar range. They are noted thieves, but confine themselves to petty offences.

The Shinwari are the only branch of the descendants of Kánsi, third son of Karshabún,[2] who still retain a corporate existence as a tribe. They lie west of the Mullágori, hold the hills to the north of the western end of the Khaibar pass, and thence stretch along the northern slopes of the Safed Koh up to the Khugiáni territory. They are divided into four great clans, Sangu Khel, Ali Sher Khel, Sepáh, and Mandozai. The Khaibar Shinwári belong to the Ali Sher Khel, and live in the Loárgi valley at Landi Kotal. Their principal septs are Píro Khel, Mír Dád Khel, Khúga Khel, Shekh Mal Khel, and Sulemán Khel. They are largely engaged in the carrying trade beween Pesháwar and Kábul; and are stalwart, hardworking and inoffensive, though much addicted to petty thieving. They probably came up to this part of the country with the Ghoria Khel (see section 409).

The Bar Mohmand.—The history of the hill or Bar Mohmand has been related in section 409. They hold the hills to the west of the Doába between the Kábul river and Bajaur and the Utmán Khel country, the southern portion of Kunar, and some of the northern hills of the Khaibar. They have also spread across our border along the Kábul river, between the two branches of which the Halímzai clan hold a small area lying between the Dáudzai and the Gugiáni. Their principal sections are Baizai, Khwáezai, Dawezai, Utmánzai, Kukozai, and Tarakzai, the last of which is divided into Halímzai, Isa Khel, Burhán Khel, and Tarakzai proper. The Halímzai and the Tarakzai proper hold land on our border, the others living further west. The Khán of Lálpura, Chief of the Mohmand, who belongs to the Tarakzai clan, probably enjoys more real power than any other tribal Chief among the Pathán of our immediate border. The Mohmand is almost as great a savage as the Afrídi, while his venality is even greater. "You have only got to put a rupee in your eye, and you may look at any Mohmand, man or woman." They formerly gave much trouble on our border.

The Utman Khel.—The history of the Utmán Khel has already been sketched in sections 408—9. They occupy both banks of the Swát river beyond our border as far up as Arang Bárang, and have, as stated in section 410, obtained a portion of the Baizai valley of Lundkhwár. The two chief clans are Umar Khel and Asíl Khel, the former of which hold the hills on the Pesháwar frontier, while the latter who live on the Swát river are the more powerful. "They are described "as tall, stout, and fair, often going naked to the waist. The women labour like the men, and "everything shows the absence of civilization. They are a sober people, with none of the vices of the Yúsufzai".[3] They give us but little trouble.

Bádi Khel	(almost extinct).
Isázai	Hasanzai.
	Madákhel.
	Akázai.
Iliászai	
Malízai	Daulatzai.
	Chagharzai.
	Núrazai.
Akozai	Ránizai.
	Khwájazai.
	Baizai.

The Yusufzai proper.—The history of the Yúsufzai has already been related in sections 408—9. Their main divisions are shown in the margin. The holdings of the Akozai clans have already been described in section 410. The Isázai hold the north-east slopes of Mahában, and the mountainous country on both sides of the Indus in Hazára and the Gadún valley. The Malízai hold eastern and the Iliászai western Buner. The Ránizai and Baizai septs of the Akozai hold all the hills beyond the northern border of Yúsufzai, the former to the west and the latter to the east. Beyond them in Buner lie the Salárzai sept of the Iliászai, and again between them and the Chamlah valley are the Núrazai of the Malízai clan, which includes the Abazai section. The Yúsufzai are incredibly superstitious, proud, avaricious, turbulent, merciless, and revengeful. But they are of a lively, merry, sociable disposition, fond of music and poetry, and very jealous of the honour of their women. Their tribal constitution is distinctly democratic.

The Jadun Country.—South of the Yúsufzai territory come Chamlah and the Khudu Khel territory already noticed. The southern parts of the country between Pesháwar and Hazára constitute the Jadún or Gadún country. The holdings of other tribes in this valley have already been noticed. The Jadún themselves occupy all the eastern portions of the valley and the southern slopes of Mahában down to the Indus, as well as a considerable area in Hazára. They are described in section 417.

412. The Pathan tribes of Hazara.—The Hazára mountains on this side of the Indus were from a very early date inhabited by a mixed population of Indian origin, the Gakkhars occupying the portion to the south and having authority over the Rájpúts of the eastern hills, while a Gújar population held most of the northern and central parts of the district. In 1399 A.D. a family of Karlágh Túrks came into India with Taimur, settled in the Pakhli plain in the north and centre of the district, and established their rule over the whole of the district, then known as the kingdom of Pakhli[4]. I have already related how, about the middle of the 16th century, the Dilazák were driven out of Pesháwar across the Indus, and were presently followed by the representatives of the old Gandhári, the present inhabitants of Swát and Buner and the mountains north and east of Pesháwar. As the Afgháns who had possessed themselves of the trans-Indus tract opposite the Hazára district increased in numbers and extended their rule, successive bands of the old inhabitants crossed the river and settled in Hazára. About the end of the 17th century[5] a Saiyad named Jalál Bába, ancestor of the famous Saiyads of Kágán, came with a heterogeneous following from Swát, drove out the Karlágh, and appropriated the northern half of the district, including the valley of Kágán. About the same time the Tanáoli crossed the river and occupied the hill country between Abbottábád and the river, now known by their name as Tanáwal; while the Jadún came over from their original seat between Pesháwar and Hazára and possessed themselves of the tract south of Abbottábád, the Tarín drove out or subjected the Gújar families of the Hazára plain, and the Utmánzai, called across the Indus by the Gújars as allies, appropriated the Gandgarh tract along the bank of the river from Torbela to the boundary of the district. During the first 20 years of the 19th century the Durráni lost their hold on the district, something like anarchy prevailed, and the distribution of tribes gradually assumed its present form. This may be broadly described as follows. Afgháns hold the country between the Gandgarh range and the Indus, and the plains for some little distance south-east of the junction of the Siran and Dor. Tribes of Indian origin hold the whole south and south-east of the district and the eastern hills as high up as Garhi Habíbullah opposite Muzaffarábád, the Gakkhars holding the south of the tract along both banks of

[1] Macgregor's *Gazetteer of the North-Western Frontier, verb.* Afrídi.

[2] Dr Bellew says they came from Persia in the time of Nádir Sháh, and settled among the Pathán.

[3] Macgregor's *Gazetteer, voce* Utmán Khel.

[4] Major Wace says they were a clan of the Hazára Túrks. But the Túrks who gave their name to the district are supposed to have come with Changiz Khán and not with Taimur. Perhaps they were the same men, and have confused the two invaders in their traditions.

[5] This is the date given approximately by Major Wace. It should perhaps be put a century earlier.

Part III.—The Jat, Rajput, and Allied Castes.

444. Rajputs of the Eastern Plains.—The tribes which I shall first discuss are divided into two groups. All but the last four are almost confined to the Dehli territory, at least as Rájpúts proper, and are roughly arranged in order from north to south down the Jamna valley, and then westwards through Rohtak and Hissár. The last four tribes carry on the series through Patiála, Firozpur, and Gújránwála, and connect the Rájpúts of the Eastern with those of the Western Plains. The first group belongs chiefly to the great royal families of the Rájpúts who, occupying the Dehli territory, have not as a rule superseded their old tribal designation by a local name, as has been so often the case in the west of the Panjáb. The great majority of them are descendants of the Túnwar and Chauhán dynasties of Dehli. Their local distribution is fairly well marked, the Túnwar lying to the north-west of the first group, and shutting off the Jat tribes of the Central Plains from the Rájpúts of the Dehli territory, their line being broken only, I believe, by the Chauhán colony on the Ghaggar of the Hissár border. Next to them come the Chauhán, Mandahár, and Pundír of the Kurukshetr, and the Ráwat, Gaurwa, Bargújar and Jádu of Dehli and Gurgáon, followed by the Játu, themselves Túnwar, and the Bágri of Hissár. The Punwár colony of Rohtak will be discussed with the Rájpúts of the Western Plains. The Jats who are shown in the Abstract on the next page are very largely if not wholly true Jats, who have returned a real Jat tribe and have been shown under that tribe among Jats, but have also entered the Rájpút tribe from which they claim to be descended, and are thus entered under that head also. The Rájpút of these parts is a true Rájpút. Living in the shadow of Dehli, the capital of his ancestral dynasties, he clings to the traditions of his caste. He cultivates largely, for little other occupation is left him; but he cultivates badly, for his women are more or less strictly secluded and never work in the fields, while he considers it degrading to actually follow the plough, and will always employ hired ploughmen if he can possibly afford it. He is a great cattle-grazier and as great a cattle-thief. His tribal feeling is strong, and the heads of the village or local group of villages have great influence. He is proud, lazy, sometimes turbulent, but generally with something more of the gentleman about him than we find in the more rustic Jat. Abstract No. 79 on the opposite page gives the distribution of these tribes.

445. The Rajput tribes of the Eastern Plains. The Tunwar (No. 1).—The Túnwar, although a sub-division of the Jádúbansi, is generally reckoned as one of the 36 royal tribes of Rájpúts. It furnished India with the dynasty of Vikramáditya, the beacon of later Hindu chronology, and Dehli with its last Indian rulers, Anangpál the last Túnwar Rája abdicating in favour of his Chauhán grandchild Pirthi Ráj, in whose time the Musalmáns conquered North-Western India. An early Anangpál Túnwar founded in 792 A.D. the city of Dehli on the ruins of the ancient Indrapat, and his dynasty ruled there for three and a half centuries. It is therefore natural that the Túnwar should be found chiefly in the eastern districts of the Province. In Dehli itself, indeed, they are less numerous than might have been expected. But they are exceedingly numerous in Ambála, Hissár, and Sirsa. The name being a famous one, many Rájpúts of various tribes which have no real connection with the Túnwar have returned it. Thus 1,200 men in Karnál are returned as Chauhán Túnwar, who are probably Chauháns. So in Ráwalpindi 1,939 men are shown as Bhatti Túnwar, though here the confusion is more excusable, being justified by origin though not by modern usage. The figures are of course shown twice over in each case. The figures for Túnwar Jats probably represent nothing more than traditional origin. Half the number are in Gurgáon, where there is a considerable settlement of Túnwar Rájpúts.

The Túnwar are the westernmost of the great Rájpút tribes of the eastern Panjáb. When ejected from Dehli they are said to have settled at Púndri in Karnál, on the Ambála border and once the seat of the Pundír, and thence to have spread both north and south. They now occupy Hariána or the greater part of the Hissár district, and stretch across Karnál and the south of Patiála into the west of the Ambála district, separating the Chauhán and other Rájpúts who hold the Jamna districts to the east of them from the great Jat tribes of the Málwa which lie to their west. There is however a Chauhán colony to the north-west of them on the lower Ghaggar in the Hissár district and Patiála. The Játu of Hariána are a Túnwar clan.

The Chauhan (No. 2).—The Chauhán is one of the Agnikula tribes and also one of the 36 royal families. Tod calls them the most valiant of the whole Rájpút race, and to them belonged the last Hindu ruler of Hindústán. Before the seat of their power was moved to Dehli, Ajmer and Sámbhar in Jaipur seem to have been their home. After their ejectment from Dehli they are said to have crossed the Jamna to Sambhal in Murádábád, and there still dwell the genealogists and bards of the Chauhán of the Nardak of Karnál and Ambála. This tract, the ancient Kurukshetr or battle-field of the Kauravas and Pándavas, is still occupied very largely by Rájpúts; in the west by the Túnwar, themselves descendants of the Pándavas, but for the most part by the Chauhán whose central village is Júndla in Karnál, and who occupy all the country lying immediately to the east of the Túnwar tract in Ambála and Karnál and the adjoining parts of Patiála, Nábha, and Jínd. All this country was held by the Pundír Rájpúts till the Chauhán came over from Sambhal under Rána Hai Rai some 20 generations ago, probably in the time of Bahlol Lodi, and drove the Pundír across the Jamna. The Chauhán appear from our figures to be numerous throughout the remaining districts of the Dehli and Hissár divisions and in Gújránwála, Firozpur, Ráwalpindi, and Sháhpur. But Chauhán being perhaps the most famous name in the Rájpút annals, many people who have no title to it have shown themselves as Chauhán. In Karnál 1,520 Pundír, 850 Punwár, 1,200 Túnwar, 6,300 Mandahár, and some 900 of other tribes have shown themselves as Chauhán also. In Sháhpur 6,700 persons are returned as Gondal Chauhán, and this accounts for the so-called Chauháns of this district. The Jat Chauháns, too, are probably for the most part Jat tribes of alleged Chauhán origin. Thus among the Jats, in Gújránwála 2,200 Chima and nearly 1,000 persons of other Jat tribes, in Firozpur 600 Joya and 200 Sidhu, and in Jahlam 2,000, and in Gujrát 650 Gondal, have returned themselves as Chauhán also, and so in many minor instances. All these figures are shown twice over. The Khichi and Varaich are also Chauhán clans numerous in the Panjáb, and have perhaps sometimes returned themselves as Chauhán only. The Chauhán of the Dehli district have taken to widow-marriage, and are no longer recognised by their fellow Rájpúts. The Chauhán of Gurgáon have however retained their pre-eminent position, and are connected with the Chauhán family of Nímrána, a small State now subject to Alwar.

The Mandahar (No. 3).—The Mandahár are almost confined to the Nardak of Karnál, Ambála and the neighbouring portion of Patiála. They are said to have come from Ajudhia to Jínd, driving the Chandel and Brá Rájpúts who occupied the tract into the Siwáliks and across the Ghaggar respectively. They then fixed their capital at Kalávit in Patiála, with minor centres at Safídon in Jínd and Asandh in Karnál. They lie more or less between the Túnwar and Chauhán of the tract. But they have in more recent times spread down below the Chauhán into the Jamna riverain of the Karnál district, with Gharaunda as a local centre. They were settled in these parts before the advent of the Chauhán, and were chastised at Samána in Patiála by Firoz Sháh. The Mandahár, Kandahár, Bargújar, Sankarwál, and Panihár Rájpúts are said to be descended from Láwa, a son of Rám Chandra, and therefore to be Solar Rájpúts; and in Karnál at least they do not intermarry. A few Mandahár are found east of the Jamna in Saháranpur, but the tribe appears to be very local.

The Pundir (No. 4).—The Pundír would appear to belong to the Dahíma royal race of which Tod says:—"Seven centuries "have swept away all recollection of a tribe who once afforded one of the proudest themes for the song of the bard." They were the most powerful vassals of the Chauhán of Dehli, and Pundír commanded the Lahore frontier under Pirthi Ráj. The original seat of the Panjáb Pundír was Thánesar and the Kurukshetr of Karnál and Ambála, with local capitals at Púndri, Ramba, Hábri, and Púndrak; but they were dispossessed by the Chauhán under Rána Har Rai, and for the most part fled beyond the Jamna. They are, however, still found in the Indri pargannah of Karnál and the adjoining portion of Ambála.

Part III.—The Jat, Rajput, and Allied Castes.

The Rawat (No. 5).—The Ráwat has been returned as a Jat tribe, as a Rájpút tribe, and as a separate caste. I have shown the three sets of figures side by side in Abstract No. 79. The Ráwat is found in the sub-montane districts, and down the whole length of the Jamna valley. It is very difficult to separate these people from the Ráthis of the Kángra hills; indeed they would appear to occupy much the same position in the sub-montane as the Ráthis or even the Kanets do in the higher ranges. They are admittedly a clan of Chandel Rájpúts; but they are the lowest clan who are recognised as of Rájpút stock, and barely if at all admitted to communion with the other Rájpúts, while under no circumstances would even a Ráthi marry a Ráwat woman. They practise widow-marriage as a matter of course. There can, I think, be little doubt that the Chandel are of aboriginal stock, and probably the same as the Chandál of the hills of whom we hear so much; and it is not impossible that these men became Chanáls where they were conquered and despised outcasts, and Rájpúts where they enjoyed political power. The Ráwat is probably akin to the *Ráo sub-division of the Kanets, whom again it is most difficult to separate from the Ráthis; and the Chandel Rájpúts* also have a Ráo section. In Dehli 1,075 persons have shown themselves as Ráwat Gaure, and are included also under Gaurwa, the next heading.

446. The Rajput tribes of the Eastern Plains continued. The Gaurwa (No. 6) and Gaur.—I am not at all sure that these figures do not include some Gaur as well as Gaurwa Rájpúts (see the last sentence *supra*) for the name was often spelt Gaura in the papers. The Gaur are that one of the 36 royal families to which belonged the Rájpút Kings of Bengal. They are found in the central Jamna-Ganges *doáb* and are fully described by Elliott and Sherring. In our tables we have 1,790 Rájpúts returned as Gaur, mostly in Dehli and Gurgáon, and they are not shown in the Abstract. Gaurwa would seem to be applied generally to any Rájpúts who have lost rank by the practice of *karewa*. In Dehli however they form a distinct clan, both they and the Chauhán practising widow-marriage, but the two being looked upon as separate tribes. They are described by Mr. Maconachie as "especially noisy and quarrelsome, but sturdy in build, and clannish in disposition," while the Dehli Chauhán are said to be "the best Rájpút cultivators in the district, and otherwise decent and orderly."

The Bargujar (No. 7).—The Bargújar are one of the 36 royal families, and the only one except the Gahlot which claims descent from Láwa son of Rám Chandra. The connection between the Mandahár and Bargújar has already been noticed under the head Mandahár. They are of course of Solar race. Their old capital was Rájor, the ruins of which are still to be seen in the south of Alwar, and they held much of Alwar and the neighbouring parts of Jaipur till dispossessed by the Kachwáha. Their head-quarters are now at Anúpshahr on the Ganges, but there is still a colony of them in Gurgáon on the Alwar border. Curiously enough, the Gurgáon Bargújar say that they came from Jálandhar about the middle of the 15th century; and it is certain that they are not very old holders of their present capital of Sohna, as the buildings of the Kambohs who held it before them are still to be seen there and are of comparatively recent date. Our figures for Gurgáon are certainly very far below the truth.

The Jadu (No. 8).—The Jádu or Jádúbansi are of Lunar race, and are called by Tod "the most illustrious of all the tribes of "Ind." But the name has been almost overshadowed by Bhatti, the title of their dominant branch in modern times. Only 4,580 persons have returned themselves as Jádu, and those chiefly in Dehli and the south of Patiála.

The Jatu (No. 9).—The Játu are said to be a Túnwar clan who once held almost the whole of Hissár, and are still most numerous in that district and the neighbouring portions of Rohtak and Jínd. In fact the Túnwar of Hariána are said to have been divided into three clans named after and descended from three brothers, Játu, Raghu and Satraula, of which clans Játu was by far the largest and most important, and once ruled from Bhiwáni to Agroha. They are the hereditary enemies of the Punwár of Rohtak, and at length the sandhills of Mahm were fixed upon as the boundary between them, and are still known as *Játu Punwár ka dandu* or the Játu-Punwár boundary. Of the Karnál Játu 500 have returned themselves as Chauhán also, and are included under both heads.

The Bagri (No. 10).—The word Bágri is applied to any Hindu Rájpút or Jat from the Bágar or prairies of Bikáner, which lie to the south and west of Sirsa and Hissár. They are most numerous in the latter district, but are found also in some numbers under the heading of Jat in Siálkot and Patiála. The Gurdáspur Bágri are Salahria who have shown themselves also as Bágar or Bhágar by clan, and probably have no connection with the Bágri of Hissár and its neighbourhood. Or it may be that the word is a *misreading for Nágri, who claim to be Chauhán Rájpúts who migrated from Dehli in the time* of Ala-ud-dín Ghori, and who hold 17 villages in the Siálkot district. These last are certainly Jats, not Rájpúts. The Bágri Rájpúts are probably Bhatti, or possibly Ráhtor. The Godára and Púniya are probably the Ját tribes that are most numerous in the Bágar.

The Rangar.—Rángar is a term, somewhat contemptuous, applied in the eastern and south-eastern districts to any Musalmán Rájpút; and I only notice it here because the Rángar are often, though wrongly, held to be a Rájpút tribe. I am told, however, that in Firozpur and Gurdáspur there are small Rájpút colonies known only by this name; and if so it is probable that they have migrated from the Dehli territory. If a Hindu Chauhán Rájpút became Musalmán to-morrow, he would still be called a Chauhán Rájpút by both himself and his neighbours of both religions. But his Hindu brethren would also call him Rángar, which he would resent as only slightly less abusive than *chotikat*, a term of contempt applied to those who have, on conversion to Islám, cut off the *choti* or Hindu scalplock. The Rángar or Musalmán Rájpúts bear the worst possible reputation for turbulence and cattle-stealing, and gave much trouble in the mutiny. Many proverbs concerning them are quoted under the head of Gújar. Here is another—"A Rángar is best in a *wineshop, or in a prison, or on horseback, or in a deep pit.*" I believe that in Central India the term Rángar is applied to any uncouth fellow [1].

The Baria (No. 11).—The Baria of Jálandhar are said to be Solar Rájpúts, descended from Rája Karan of the Mahábhárat. Their ancestor Mal (!) came from Jal Kálra in Patiála about 500 years ago. Those of Siálkot, where they are found in small numbers, but considered to be Jats, not Rájpúts, say they are of Lunar Rájpút descent. The tribe is practically confined to Patiála and Nábha, and the name of the ancestor Mal, if common to the tribe, looks as if they were not Rájpúts at all, though it is unusual in the Sikh States for Jats to claim the title of Rájpút. I have no further information regarding the tribe. There are Barhaiya Rájpúts in the Azimgarh and Gházípur neighbourhood.

The Atiras (No. 12).—This tribe is returned from Patiála only. I cannot find it mentioned in any of the authorities.

The Naipal (No. 13).—The Naipál are a clan of the great Bhatti tribe, who are found on the Satluj above Firozpur. They once held the river valley as far down as that town, but were driven higher up by the Dogars, and in their turn expelled the Gújars. Mr. Brandreth says of them:—"They resemble very much in their habits the Dogars and Gújars, and are probably greater thieves "than either. They appear almost independent under the Ahlúwália rulers, and to have paid a small rent in kind only when the "Kárdár was strong enough to compel them to it, which was not often the case. They have lost more of their Hindu origin than "either the Dogars or Gújars, and in their marriage connections they follow the Muhammadan law, near blood relations being per-"mitted to enter into the marriage compact." All the Naipál have returned themselves as Bhatti as well, and it is possible that many of them have shown Bhatti only as their tribe, and are therefore not returned under the head Naipál.

The Rathor (No. 14).—The Ráthor are one of the 36 royal races, and Solar Rájpúts Their old seat was Kanauj, but their more modern dynasties are to be found in Márwár and Bikáner. They are returned from many districts in the Panjáb, but are nowhere numerous.

447. The Rajputs of the Western Plains.—The next group of Rájpút tribes that I shall discuss are those of the great Western Plains. I have already said much regarding the position of the Rájpút in this

[1] Mr. Wilson notes that he has heard Rángar applied to Hindu Rájpúts. This is, I think, unusual. The word is often spelt and pronounced Ránghar.

Part IV.—Minor Land-owning and Agricultural Castes.

PART IV.—MINOR LAND-OWNING AND AGRICULTURAL CASTES.

460. Introductory and General.—I have roughly grouped the tribes and castes which I propose to discuss in this part of the present chapter under three heads, Minor Dominant Tribes, Minor Agricultural and Pastoral Tribes, and Foreign Races. The figures for each group will be found prefixed to the detailed discussion of the castes which compose it. No very definite line can be drawn between the several groups; but the general idea of the classification has been to include in the first such tribes or castes as, while not of sufficient magnitude or general importance to rank with the four great races which have been discussed in the two preceding parts of the chapter, yet occupy a social position somewhat similar to theirs, and either are or have been within recent times politically dominant in their tribal territories. In the second group I have included those cultivating tribes who, while forming a very large and important element in the agricultural section of the population, occupy a subject or subordinate position, and have not, at least within recent times, risen to political prominence. The third group includes that miscellaneous assortment of persons who bear titles, such as Shekh or Mughal, which purport to denote foreign origin. Many, perhaps most of them, are really of Indian origin, and many of them are neither agriculturists nor land-owners. But no general grouping of castes in the Panjáb can hope to be exact; and this appeared to be the most convenient place in which to discuss them. The tribes discussed in this part of the chapter complete the essentially land-owning or agricultural tribes of the Panjáb. The Bráhmans and Saiyads cultivate largely, while the mercantile classes own large areas; but they will be more conveniently dealt with under a separate head in the next part of the chapter.

MINOR DOMINANT TRIBES.

461. Minor dominant tribes.—The tribes or castes which I have included in Abstract No. 83 on the next page, are those which are, like the Jats and Rájpúts, dominant in parts of the Panjáb, but are not so numerous or so widely spread as to rank with those great races. Indeed many of them are probably tribes rather than castes or races; though in some cases their origin has been forgotten, while in others an obviously false origin has been invented. They are divided into four groups, the Karrál, Gakkhar, Awán, and Khattar of the Salt-range Tract, the Khokhar, Kharral, and Dáúdpotra of the Western Plains, and the Dogar, Ror, Taga, Meo, and Khánzádah of the Eastern Plains; while the Gújar, who is more widely distributed than the rest, comes last by himself. With the Western Plains group are included the Káthia, Háns, and Khagga, for whom I have no separate figures: indeed it will be apparent from a perusal of the following paragraphs that the figures for all these minor castes in the western half of the Province are exceedingly imperfect. Not only are the lax use of the word Jat and the ill-defined nature of the line separating Jats from Rájpúts already alluded to sources of great confusion, but many of these tribes have set up claims to an origin which shall connect them with the founder of the Mahomedan religion, or with some of the great Mahomedan conquerors. Thus we find many of them returned or classed as Shekh, Mughal, or what not; and the figures of the Abstract alone are exceedingly misleading. I have in each case endeavoured to separate the numbers thus returned, and to include them under their proper caste headings; and it is the figures thus given in the text, and not those of the tables, that should be referred to. Even these are not complete, for till we have the full detail of clans we cannot complete the classification.

The ethnic grouping of the tribes discussed in this section is a subject which I had hoped to examine, but which lack of time compels me to pass by unnoticed. I will only note how the tendency on the frontier and throughout the Salt-range Tract is to claim Arab or Mughal, and in the rest of the Province to claim Rájpút origin. The two groups of tribes which occupy the mountain country of the Salt-range and the great plateaus of the Western Plains are the most interesting sections of the Panjáb land-owning classes, need the most careful examination, and would reward it with the richest return.

462. The Karral (Caste No. 101).—The Karráls are returned for Hazára only; and I have no information concerning them save what Major Wace gives in his Settlement Report of that district. He writes: "The Karrál country consists of the Nára *iláqah* in the Abbottábád *tahsíl*. The Karráls were "formerly the subjects of the Gakkhars, from whom they emancipated themselves some two centuries ago. "Originally Hindus, their conversion to Islám is of comparatively modern date. Thirty years ago "their acquaintance with the Mahomedan faith was still slight; and though they now know more of it, "and are more careful to observe it, relics of their former Hindu faith are still observable in their social "habits. They are attached to their homes and their fields, which they cultivate simply and industriously. "For the rest, their character is crafty and cowardly." Major Wace further notes that the Karráls are "identical in origin and character with the Dhúnds." This would make the Karráls one of the Rájpút tribes of the hills lying along the left bank of the Jahlam; and I have been informed by a native officer that they claim Rájpút origin. They are said too to have recently set up a claim to Kayáni Mughal origin, in common with the Gakkhars; or, as a variety, that their ancestor came from Kayán, but was a descendant of Alexander the Great! But the strongest story of all is that a queen of the great Rája Rasálu of Panjáb folklore had by a paramour of the scavenger class four sons, Seo, Teo, Gheo, and Karu, from whom are respectively descended the Siáls, Tiwánas, Ghebas, and Karráls. They intermarry with Gakkhars, Saiyads, and Dhúnds.

Part IV.—Minor Land-owning and Agricultural Castes.

463. The Gakkhar (Caste No. 68).—The Gakkhars are the ancient rulers of the northern portion of the cis-Indus Salt-range Tract, just as are the Awáns and Janjúas of the southern portion of the same tract; and it appears probable that they at one time overran Kashmír, even if they did not found a dynasty there. Their own story is that they are descended from Kaigohar of the Kayáni family then reigning in Ispahán; that they conquered Kashmír and Tibet and ruled those countries for many generations, but were eventually driven back to Kábul, whence they entered the Panjáb in company with Mahmúd Ghaznavi early in the 11th century. This last is certainly untrue, for Ferishtah relates that in 1008 Mahmúd was attacked by a Gakkhar army in the neighbourhood of Pesháwar. Sir Lepel Griffin thinks that they were emigrants from Khorásán who settled in the Panjáb not later than 300 A.D., and points out that, like the Persians and unlike the other tribes of the neighbourhood, they are still Shíahs. It is at any rate certain that they held their present possessions long before the Mahomedan invasion of India. Ferishtah writes of them during Muhammad Ghori's invasion in 1206 A.D.:—

"During the residence of Muhammad Ghori at Lahore on this occasion, the Gakkhars who inhabit the country along the banks "of the Nílab up to the foot of the mountains of Siwálik, exercised unheard of cruelties on the Muhammadans and cut off the "communication between the provinces of Pesháwar and Multán. These Gakkhars were a race of wild barbarians, without either "religion or morality. It was a custom among them as soon as a female child was born, to carry her to the door of the house and "there proclaim aloud, holding the child in one hand and a knife in the other, that any person who wanted a wife might take her "otherwise she was immediately to be put to death. By this means they had more men than women which occasioned the custom of "having several husbands to one wife. When this wife was visited by one of her husbands she left a mark at the door, which being "observed by any of the other husbands, he withdrew till the signal was taken away. This barbarous people continued to make "incursions on the Muhammadans till in the latter end of this king's reign their chieftain was converted to the true faith while "a captive. A great part of these mountaineers, having very little notion of any religion, were easily induced to adopt the tenets "of the true faith; at the same time most of the infidels who inhabited the mountains between Ghazni and the Indus were also "converted, some by force and others by persuasion, and at the present day (1609 A.D.) they continue to profess the faith of Islám." *Briggs' Ferishtah, i. 183f.*

The Gakkhars however did not hesitate to assassinate Muhammad Ghori on his return from Lahore.

General Cunningham identifies the Gakkhars with the Gargaridæ of Dionysius, and holds them to be descendants of the great Yueti or Takhari Scythians of the Abár tribe, who moved from Hyrkania to Abryán on the Jahlam under either Darius Hystaspes (circa 500 B.C.), or still earlier under one of the Scytho-Parthian Kings. The whole origin and early history of the tribe will be found discussed at pages 22 to 33, Vol. II. of the Archæological Reports, and at pages 574 to 581 of Griffin's *Panjáb Chiefs*; while much information as to their early history is given in Brandreth's Settlement Report of the Jahlam district. As Mr. Thomson says: "The Turanian origin of the Gakkhars is highly probable; but the rest of the "theory is merely a plausible surmise. On the whole there seems little use in going beyond the sober "narrative of Ferishtah, who represents the Gakkhars as a brave and savage race, living mostly in the hills, "with little or no religion, and much given to polyandry and infanticide." They have now, in apparent imitation of the Awáns, set up a claim to Mughal origin; and many of the Ráwalpindi Gakkhars returned themselves as Mughals, while I am told that some of the Gakkhars of Chakwál entered themselves as Rájpúts.

464. At present the Gakkhars are practically confined to the Ráwalpindi, Jahlam, and Hazára districts, where they are found all along the plateaus at the foot of the lower Himálayas, from the Jahlam to Harípur in Hazára. To the figures given in Table VIII A should be added 1,543 persons who returned themselves in Ráwalpindi as Mughal Gakkhar, and perhaps 4,549 others who returned themselves as Mughal Kayáni, of whom 3,861 were in Ráwalpindi, 592 in Jahlam, and 93 in Kohát. This would raise the total number of Gakkhars to 31,881, of whom about half are in Ráwalpindi. They are described by Mr. Thomson as compact, sinewy, and vigorous, but not large boned; making capital soldiers and the best light cavalry in Upper India; proud and self-respecting, but not first-class agriculturists; with no contempt for labour, since many work as coolies on the railway; but preferring service in the army or police. Their race feeling is strong, and a rule of inheritance disfavours Gakkhars of the half-blood. Colonel Cracroft notes that they refuse to give their daughters in marriage to any other class except Saiyads, that they keep their women very strictly secluded, and marry only among the higher Rájpúts, and among them only when they cannot find a suitable match among themselves. "Some of their principal "men are very gentlemanly in their bearing, and show unmistakeably their high origin and breeding. They "still cling to their traditions and, though the Sikhs reduced them to the most "abject poverty, are looked up to in the district as men of high rank and "position, and in times of commotion they would assuredly take the lead one "way or the other." Thus the character of the "savage Gargars" seems to have been softened and improved by time. The Gakkhars do not seem always to have returned their clans, which are very well marked. I give in the margin the figures for a few of the largest. Their local distribution in the Jahlam district is fully described in Mr. Thomson's Settlement Report.

465. The Awan (Caste No. 12).—The Awáns, with whom have been included all who returned themselves as Qutbsháhi, are essentially a tribe of the Salt-range, where they once held independent possessions of very considerable extent, and in the western and central portions of which they are still the dominant race. They extend along the whole length of the range from Jahlam to the Indus, and are found in great numbers throughout the whole country beyond it up to the foot of the Suleimáns and the Safed Koh; though in Trans-Indus Bannu they partly and in Dehra Ismáil almost wholly disappear from our tables, being included in the term Jat which in those parts means not very much more than *et cætera*. Thus we find among the Jats of our tables no fewer than 30,015 who returned Awán as their tribe and who should probably be classed as Awán, of whom the details are given in the margin.

Part IV.—Minor Land-owning and Agricultural Castes.

foot of the hills into Siálkot. There are also considerable colonies of them in Hissár and Karnál. They are thus described by Mr. Brandreth in his Firozpur Report:—

"In my account of the Firozpur ilaqua I have already alluded to the Dogars, who are supposed to be converted Chauhan Rajputs from the neighbourhood of Dehli. They migrated first to the neighbourhood of Pák Pattan, whence they spread gradually along the banks of the Satluj, and entered the Firozpur district about 100 years ago. The Firozpur Dogars are all descended from a common ancestor named Bahlol, but they are called Mahu Dogars, from Mahu the grandfather of Bahlol. Bahlol had three sons, Bambu, Langar, and Sammu. The Dogars of Firozpur and Mullanwala are the descendants of Bambu; those of Khai the descendants of Langar; the descendants of Sammu live in the Kasúr territory. There are many other sub-castes of the Dogars in other districts along the banks of the Satluj, as the Parchats, the Topuras, the Chopuras, &c. The Chopura Dogars occupy Mandot. The Firozpur Dogars consider themselves superior in rank and descent to the other sub-castes. They are very particular to whom they give their daughters in marriage though they take wives from all the other families. At one time infanticide is said to have prevailed among them, but I do not think there is much trace of it at the present day.

"Sir H. Lawrence, who knew the Dogars well, writes of them that 'they are tall, handsome, and sinewy, and are remarkable for having, almost without exception, large aquiline noses; they are fanciful and violent, and tenacious of what they consider their rights, though susceptible to kindness, and not wanting in courage; they appear to have been always troublesome subjects, and too fond of their own free mode of life to willingly take service as soldiers.' The Jewish face which is found among the Dogars, and in which they resemble the Afgháns, is very remarkable, and makes it probable that there is very little Chauhan blood in their veins, notwithstanding the fondness with which they attempt to trace their connection with that ancient family of Rajputs. Like the Gujars and Naipáls they are great thieves, and prefer pasturing cattle to cultivating. Their favourite crime is cattle-stealing. There are, however, some respectable persons among them, especially in the Firozpur ilaqua. It is only within the last few years that the principal Dogars have begun to wear any covering for the head; formerly the whole population, as is the case with the poorer classes still, wore their long hair over their shoulders without any covering either of sheet or turban. Notwithstanding the difference of physiognomy, however, the Dogars preserve evident traces of some connection with the Hindus in most of their family customs, in which they resemble the Hindus much more than the orthodox Muhammadans."

475. Mr. Purser notes that they are divided into two tribes, one of which claim to be Chauhán and the other Punwár Rájpúts, and he notes their alleged advent from Pák Pattan, but not their previous migration from Dehli. If they ever did move from Dehli to the Montgomery district, it can hardly have been since the Ghaggar ceased to fertilize the intervening country, and the date of the migration must have been at least some centuries back; and the Dogars of Hissár came to those parts from the Panjáb, probably from the Satluj across the Sirsa district. The Dogars of Lahore and Firozpur are essentially a riverside tribe, being found only on the river banks: they bear the very worst reputation, and appear from the passage quoted above to have retained till quite lately some at least of the habits of a wild tribe. I suspect that their origin was probably in the Satluj valley. They appear to have entered the Firozpur district about 1760 A.D., and during the next forty years to have possessed themselves of a very considerable portion of the district, while their turbulence rendered them almost independent of the Sikh Government. In 1808 we recognised the Dogar State of Firozpur, and took it under our protection against Ranjít Singh; but it lapsed in 1835.

The Rájpút origin of the Dogars is probably very doubtful, and is strenously denied by their Rájpút neighbours, though I believe that Dogar, or perhaps Doghar, is used in some parts of the Province to denote one of mixed blood. Another derivation of the name is *doghgar* or milkman. The Dogars seem to be originally a pastoral rather than an agricultural tribe, and still to retain a strong liking for cattle, whether their own or other people's. They are often classed with Gújars, whom they much resemble in their habits. In Lahore and Firozpur they are notorious cattle-thieves, but further north they seem to have settled down and become peaceful husbandmen. They are not good cultivators. Their social standing seems to be about that of a low-class Rájpút; they are practically all Musalmáns. The Dogars have returned hardly any large clans; some of the largest are shown in the margin.

476. The Ror (Caste No. 55).—The real seat of the Panjáb Rors is in the great *dhák* jungles south of Thánesar on the borders of the Karnál and Ambála districts, where they hold a *chaurási* nominally consisting of 84 villages, of which the village of Amín, where the Pándavas arranged their forces before their last fight with the Kauravas, is the *tíka* or head village. But the Rors have spread down the Western Jamna Canal into the lower parts of Karnál and into Jínd in considerable numbers. They are said also to hold 12 villages beyond the Ganges. They are fine stalwart men, of very much the same type as the Jats, whom they almost equal as husbandmen, their women also working in the fields. They are more peaceful and less grasping in their habits than the Jats, and are consequently readily admitted as tenants where the latter would be kept at arm's length.

Of their origin I can say nothing certain. They have the same story as the Aroras, of their having been Rájpúts who escaped the fury of Paras Rám by stating that their caste was *aur* or "another." The Aroras are often called Roras in the east of the Panjáb; yet I can hardly believe that the frank and stalwart Ror is of the same origin as the Arora. The Amín men say that they came from Sambhal in Murádábád; but this may only be in order to connect themselves with their neighbours the Chauhán Rájpúts, who certainly came from there. But almost all the Rors alike seem to point to Bádli in the Jhajjar *tahsíl* of Rohtak as their immediate place of origin, though some of them say they came from Rájpútána. Their social status is identical with that of Jats; and they practise *karewa* or widow-marriage, though only, they say, within the caste. Their sub-divisions seem to be exceedingly numerous. A few of the largest are given in the margin. The Ambála Rors would appear to be mostly Sagwál.

477. The Taga (Caste No. 86).—The Tagas of the Jamna Khádir of Dehli and Karnál, the only part of the Province in which they are found, are said to be Gaur Bráhmans by origin, and to have acquired their present name because they "abandoned" (*tág dena*) priestly functions and took to agriculture. Their origin is discussed at great length in Vol. I of Elliott's *Races of the North-West Provinces*, pages 106 to 115; and they are there identified with the Takkas, a possibly Scythian race who had the snake for their totem, and whose destruction by Rája Janamajáya is supposed to be

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Part IV.—Minor Land-owning and Agricultural Castes.

commemorated in the tradition of that monarch's holocaust of serpents. The difficulty felt by Sir H. Elliott in accounting for their tracing their origin to Hariána, is perhaps explained by the fact that they give Saffidon in Jínd on the border of Hariána, as the place where the holocaust took place; and the name of the town is not improbably connected with *sámp* or snake. The Tagas are probably the oldest inhabitants of the upper Jamna Khádir, holding villages which have been untouched by changes in the course of the stream for a far longer period than most of their neighbours. They are of superior social standing and seclude their women, but are bad cultivators, especially the Mahomedans. About three-fourths of the total number have adopted Islám and ceased to wear the sacred thread. The Hindus still wear it, but Bráhmans do not intermarry with them, and they employ Bráhmans to officiate for them in the usual manner. They are poor agriculturists. They must be carefully distinguished from the Tágus or criminal Bráhmans of the same tract discussed in section 586.

478. The Meo (Caste No. 34).—The Meos are the people who have given its name to Mewát or the hill country of Alwar, Gurgáon, and Bhartpur. They are found within the Pánjab chiefly in Gurgáon, though a considerable number have spread into the south of the Dehli district. They are all Mahomedan, though, as will be seen presently, their religion is of a very impure type. They are so excellently described by Captain Powlett in his Gazetteer of Alwar, that I cannot do better than quote the passage almost in full, adding to it Mr. Channing's remarks upon it. Captain Powlett writes as follows:—

"The Meos are numerically the first race in the State, and the agricultural portion of them is considerably more than double "any other class of cultivators except Chamars. They occupy about half the Ulwar territory, and the portion they dwell in lies to "the north and east.

"They are divided into fifty-two clans, of which the twelve largest are called 'Páls,' and the smaller 'Gots.' Many of these "are not settled in Ulwar, but would be found in Mathra, Bhartpur, and Gurgaon. Of the 448 villages belonging to the Meos, the "*Ghaseria* clan holds 112, the *Dhingal* 70, the *Landáwat* 64, the *Nai* 63, the *Singal* 54, the *Dulot* 53, and the *Pundlot* 22.

"It has already been set forth in the historical sketch that the Meos—for they no doubt are often included under the term "Mewatti—were, during the Muhammadan period of power, always notorious for their turbulence and predatory habits; however, "since their complete subjection by Bakhtáwar Singh and Banni Singh (during the first-half of this century), who broke up the "large turbulent villages into a number of small hamlets, they have become generally well behaved; but they return to their former "habits when opportunity occurs.

"In 1857 they assembled, burnt state ricks, carried off cattle, &c., but did not succeed in plundering any town or village in 'Ulwar. In British territory they plundered Firozpur and other villages, and when a British force came to restore order many were "hanged.

"Though Meos claim to be of Rajput origin, there are grounds for believing that many spring from the same stock as the Mínas. "The similarity between the words Meo and Mína suggest that the former may be a contraction of the latter. Several of the res-"pective clans are identical in name (Singal, Nai, Dulot, Pundlot, Dingal, Balot); and a story told of one Daria Meo, and his lady-"love Sisbadani Míni, seems to show that they formerly intermarried. In Bulandshahr a caste called Meo Mínas is spoken of in "the Settlement Report, which would seem farther to connect the two. However, it is probable enough that apostate Rajputs and "bastard sons of Rajputs founded many of the clans, as the legends tell.

"The Meos are now all Musalmans in name; but their village deities are the same as those of Hindu zamindars. They keep "too several Hindu festivals. Thus the Holi is with Meos a season of rough play, and is considered as important a festival as the "Moharram, Id, and Shabrát; and they likewise observe the Janamashtami, Dusehra, and Diwáli. They often keep Brah-"min priests to write the *pili chitthi*, or note fixing the date of a marriage. They call themselves by Hindu names, with the "exception of 'Rám;' and 'Singh' is a frequent affix, though not so common as 'Khan.'

"On the Amáwas, or monthly conjunction of the sun and moon, Meos, in common with Hindu Ahirs, Gujars, &c., cease from "labour; and when they make a well the first proceeding is to erect a 'Chabútra' to 'Bairúji' or 'Hanúmán.' However, when "plunder was to be obtained, they have often shown little respect for Hindu shrines and temples; and when the sanctity of a threat-"ened place has been urged, the retort has been '*Tum to Deo, Ham Meo*!' You may be a Deo (God), but I am a Meo!

"As regards their own religion Meos are very ignorant. Few know the *kalima*, and fewer still the regular prayers, the seasons "of which they entirely neglect. This, however, only applies to Ulwar territory; in British, the effect of the schools is to make "them more observant of religious duties. Indeed, in Ulwar, at certain places where there are mosques, religious observances are "better maintained, and some know the *kalima*, say their prayers, and would like a school.

"Meos do not marry in their Pál or clan, but they are lax about forming connections with women of other castes, whose children "they receive into the Meo community. As already stated Brahmins take part in the formalities preceding a marriage, but the "ceremony itself is performed by the Kazi.

"As agriculturists, Meos are inferior to their Hindu neighbours. The point in which they chiefly fail is in working their wells, "for which they lack patience. Their women, whom they do not confine, will, it is said, do more fieldwork than the men; indeed "one often finds women at work in the crops when the men are lying down. Like the women of low Hindu castes they tattoo their "bodies, a practice disapproved by Musalmans in general. Meos are generally poor and live badly; they have no scruples about "getting drunk when opportunity offers. The men wear the *dhoti* and *kamri*, and not *pahjámas*. Their dress is, in fact, Hindu. "The men often wear gold ornaments, but I believe the women are seldom or never allowed to have them."

To this Mr. Channing adds:—

"My own enquiries on the subject were imperfect when they were interrupted by my transfer from Gurgaon; but they led me to "a conclusion, which I find has also been adopted by Major Powlett, that the Mínas and Meos are connected, and I should be inclined "to add that both are probably representatives of the earlier non-Aryan inhabitants of the country. In Tod's Rajasthan, Vol. II, "page 76, I find it stated that Mewás o is a name given to the fastnesses in the Aravalli hills, to which Mínas, Kolis and others "make their retreat. Pál is, on the same authority, the term for a community of any of the aboriginal mountain races; its import "is a defile or valley, fitted for cultivation and defence; and Pál is the term given to the main sub-divisions of the Meos and also of "the Mínas. These latter, who in Gurgaon are known only as a body of professional criminals, were the original masters of the State of "Amber or Jaipur, the Rájpút kingdom of which was founded by Dhole Rae about A.D. 967 after subduing the Mínas. Tod also states "that in Jaipur the Mínas are still the most numerous tribe, and possess large immunities and privileges; formerly the tika of sover-"eignty was marked by blood taken from the great toe of a Mína of Kalikho, another token, as I interpret it, of the ancient sovereignty "of the tribe. Meos are often mentioned, although not in Gurgaon, as Mína Meos: and in the older Muhammadan historians and in Tod, "I find expeditions against their country spoken of as expeditions against the Mawasat, and in later time as against the Mawas. "These facts incline me to the belief that the Meos are such of the aboriginal Mína population of the Aravalli hills as were converted to "Muhammadanism, and that their name is probably a corruption of Mewasati or the men of the mountain passes. Perhaps other "enquiries may be able to confirm or refute this theory, which I only put forward tentatively.

"Any Meo will tell glibly enough that the tribe is divided into twelve Páls and fifty-two Gots; but no two enumerations of the "Páls that I have seen correspond precisely; and the fifty-two Gots include the Páls, and are not, as would at first appear, in addi-"tion to them. The following enumeration of the Páls is perhaps correct:—

1. Balant.	5. Chirklot.	9. Yunglot.
2. Ratáwat.	6. Dimrot.	10. Dahngal.
3. Darwál.	7. Dulot.	11. Singal.
4. Landáwat.	8. Nái.	12. Kalesa or Kalsákhi.

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Part IV.—Minor Land-owning and Agricultural Castes.

"Besides these there is a thirteenth Palákhra or little Pál Páhat. The Pals which are strongest in Gurgaon are the Dahngals in the "north of Náh; the Chirklots in the south-east of Náh and in the country round Punahána; the Landáwats, Dimrots, and Dulots in "the Firozpur valley, and the Darwáls in the country south of Náh. These Meo sub-tribes still possess a strong feeling of unity and "the power of corporate action."

MEO CLANS.			
1. Chirklot	26,467	8. Bálot	2,849
2. Dhangal	24,075	9. Tanúr or Túnwar	2,432
3. Dimrot	10,277	10. Nái	2,035
4. Gurwál	5,511	11. Badgújar	2,003
5. Landáwat	3,294	12. Golwál	2,003
6. Dulot	2,999	13. Páhut	1,639
7. Dherwál	2,944	14. Baliána	1,380

The principal Meo sub-divisions returned in Gurgáon are shown in the margin. In Ambála and perhaps elsewhere the word Meo seems commonly to be used as equivalent to Men or fisherman; and it may be that some of the Meos returned from other districts than Gurgáon and those bordering upon it, are not true Meos.

479. The Khanzadah (Caste No. 123).—The Khánzádahs are practically confined to Gurgáon so far as the Panjáb is concerned. Captain Powlett describes them thus:—

"They are the Mewáti Chiefs of the Persian historians, who were probably the representatives of the ancient Lords of Mewát. "These Mewátis are called Khánzádahs, a race which, though Musalmán like the Meos, was and is socially far superior to the Meos, "and has no love for them; but who in times past have united with them in the raids and insurrections for which Mewát was "so famous, and which made it a thorn in the side of the Dehli Emperors. In fact, the expression Mewáti usually refers to "the ruling class, while Meo designates the lower orders. The latter term is evidently not of modern origin, though it is "not, I believe, met with in history; and the former is, I think, now unusual, Khánzádah having taken its place.

"The Khánzádahs are numerically insignificant, and they cannot now be reckoned among the aristocracy. In social rank "they are far above the Meos, and though probably of more recent Hindu extraction, they are better Musalmans. They observe no "Hindu festivals, and will not acknowledge that they pay any respect to Hindu shrines. But Brahmins take part in their marriage "contracts, and they observe some Hindu marriage ceremonies. Though generally as poor and ignorant as the Meos, they "unlike the latter say their prayers, and do not let their women work in the fields.

"They are not first-rate agriculturists, the seclusion of their women giving them a disadvantage beside most other castes. "Some have emigrated and taken to trade in the Gangetic cities, but these have no connection now with the original Khánzádah "country. Those who have not abandoned the traditions of their clan are often glad of military service, and about fifty are in "British regiments. In the service of the Ulwar State there are many. There are 26 Khánzádah villages in the State, in most of "which the proprietors themselves work in the field and follow the plough.

"The term Khánzádah is probably derived from Khánazád, for it appears that Bahádur Náhar, the first of the race mentioned "in the Persian histories, associated himself with the turbulent slaves of Firoz Sháh after the death of the latter, and, being a "pervert, would contemptuously receive the name of Khánazád (slave) from his brethren. The Khánzádahs themselves indignantly "repudiate this derivation, and say the word is Khán Jádú (or Lord Jádú), and was intended to render still nobler the name of the "princely Rajpút race from which they came. Converted Jádús were called by the old Musalman historians Mewátis, a term Chand "applies to a Mewát chief of the Lunar race, of which race the Jádú Maharaja of Karauli calls himself the head."

To this Mr. Channing adds:—

"Khánzádas are a race who were formerly of much more importance than at present; they claim to have been formerly Jádu "Rájpúts, and that their ancestors Lakhan Pál and Sumitr Pál, who dwelt at Tahangarh in Bhartpur, were converted to Islam "in the reign of Firoz Shah (A.D. 1351 to 1388), who gave Lakhan Pál the name of Náhir Khan and Sumitr Pál the name of "Bahadur Khan, and in recognition of their high descent called them Khánzádahs and made them bear rule in Mewat. At first "they are said to have lived at Sárahta near Tijára, and afterwards, according to tradition, they possessed 1,484 villages. However "this may be, there is no doubt that they were the ruling race in Mewat down to the time of Bábar; since then they have "gradually declined in importance, and now in this district own only a few villages near Núh and to the north of Firozpur. "Traces of their former importance exist at Sohna, Bundsi, and Kotila. Kotila was one of their chief fortresses; the village is "situated in a small valley, wholly surrounded by the hill, except where a small funnel-like pass gives entrance to it. In front of "this pass is the Kotila jhíl, and when this is filled with water the only road to the pass lies along a narrow strip of land "between the lake and the hill. The remains of a breastwork along the face of the hill and across the mouth of the pass still exist, "while on the hill above the village is a small ruined fort. The village now belongs to Meos. Some of the buildings bear witness "to its former greater importance. I have a suspicion that they are more intimately connected than they acknowledge with the "Meos, whom they seem to me to resemble in personal appearance. They do not ordinarily intermarry with Meos, but the Meo "inhabitants of five villages in the Firozpur tahsil profess to have been formerly Khánzádahs, and to have become Meos by "intermarriage. Their traditions also, which point to Sarahta as their ancient home, agree, I think it will be found, with those of "more than one clan of Meos. If my supposition that the Meos are converted Mínas is correct, I am inclined to suspect that the "Khánzádas are the representatives of the noble class among the aboriginal population. Tod mentions an Asil or unmixed class "among the Mínas, known as Mainas.

The Khánzádahs of Gurgaon have returned themselves as Jádúbansi in the column for clan, and they commonly say that this is their only *got*. Khánzádah, or "the son of a Khán" is precisely the Musalmán equivalent to the Hindu Rájpút or "son of a Rája;" and there can be little doubt that the Khánzádahs are to the Meos what the Rájpúts are to the Jats.

480. The Gujar (Caste No. 8).—The Gújars are the eighth largest caste in the Panjáb, only the Jats, Rájpúts, and Pathán among dominant castes, the mixed caste of Aráins, and the Bráhmans, Chamárs, and Chúhras exceeding them in point of number. They are identified by General Cunningham with the Kushán or Yúchi or Tochari, a tribe of Eastern Tartars. About a century before Christ their Chief conquered Kábul and the Pesháwar country; while his son Híma Kadphises, so well known to the Panjáb Numismatologist, extended his sway over the whole of the Upper Panjáb and the banks of the Jamna as far down as Mathra and the Vindhyas, and his successor the no less familiar king Kanishka, the first Buddhist Indo-Scythian prince, annexed Kashmír to the kingdom of the Tochari. These Tochari or Kushàn are the Kaspeiræi of Ptolemy; and in the middle of the second century of our æra, Kaspeira, Kasyapapura, or Multán, was one of their chief cities. Probably about the beginning of the 3rd century after Christ, the attacks of the White Huns recalled the last king of the united Yúchi to the west, and he left his son in charge of an independent province whose capital was fixed at Pesháwar; and from that time the Yúchi of Kàbul are known as the Great Yúchi, and those of the Panjáb as the Kator or Little Yúchi. Before the end of the 3rd century a portion of the Gújars had begun to move southwards down the Indus, and were shortly afterwards separated from their northern brethren by another Indo-Scythian wave from the north. In the middle of the 5th century there was a Gújar kingdom in south-western Rájpútána, whence they were driven by the Balas into Gújarát of the Bombay Presidency; and about the end of the 9th century, Ala Khána the Gújar king of Jammu, ceded the present Gújar-des, corresponding very nearly

Part IV.—Minor Land-owning and Agricultural Castes.

"Afghánistán. They do not seem to have got much below the Lahore border. Their chief divisions are "Gahlán, Chandor, Cháchar, Sindhu, and Barár." I find that the Aráins of Firozpur and Lahore also trace their origin from Uchh or Multán, and are supposed to be akin to the Kamboh. In Sirsa the Satluj Aráins meet those of the Ghaggar. The two do not intermarry, but the Aráins of the Ghaggar valley say they were Rájpúts living on the Panjnad near Multán, but were ejected some four centuries ago by Saiyad Jalál-ul-dín of Uchh. They claim some sort of connection with Jaisalmer. Till the great famines of 1759 and 1783 A.D. they are said to have held all the lower valleys, of the Choya and Ghaggar, but after the latter date the Bhattis harassed the Sumras, the country became disturbed, and many of the Aráins emigrated across the Ganges and settled near Bareli and Rámpur. They marry only with the Ghaggar and Bareli Aráins. The Satluj Aráins in Sirsa say that they are, like the Aráins of Lahore and Montgomery, connected by origin with the Hindu Kambohs. Mr. Wilson thinks it probable that both classes are really Kambohs who have become Musalmáns, and that the Ghaggar Aráins emigrated in a body from Multán, while the others moved gradually up the Satluj into their present place. He describes the Aráins of the Ghaggar as the most advanced and civilised tribe in the Sirsa district, even surpassing the Sikh Jats from Patiála; and he considers them at least equal in social status with the Jats, over whom they themselves claim superiority. The Aráins of Firozpur, Lúdhiána, Ambála, and Hissár also trace their origin from Uchh or its neighbourhood, though the Hissár Aráins are said to be merely Mahomedan Mális.

Of the Aráins of Jálandhar Mr. Barkley says that they are commonly believed to be descended from Kambohs, and that even those who are ashamed of so commonplace an origin are not prepared altogether to disclaim the relationship, but state that the Kambohs are the illegitimate and they the legitimate descendants of a common ancestor. He further states that they are settlers from the south, that none of their settlements are much older than 250 years, and that their original country is said to extend from Hánsi to Multán, while those of the Jálandhar Aráins whose history he has traced have come from the direction of Hissár. The Jálandhar Aráins themselves say they are descended from Rai Chajju of Ujjain who held the whole of the Sirsa district in *jágír;* while the Karnál Ráins also trace their origin from Sirsa. On the whole it would appear probable that the Aráins originally came from the lower Indus and spread up the five rivers of the Panjáb; and that at an early stage in their history a section of them moved up the Ghaggar, perhaps then a permanent river flowing into the Indus, and there gained for themselves a position of some importance. As the Ghaggar dried up and the neighbouring country became more arid, they moved on into the Jamna districts and cis-Satluj tract generally, and perhaps spread along the foot of the hills across the line of movement of their brethren who were moving up the valleys of the larger rivers. Their alleged connection with the Mális is probably based only upon common occupation; but there does seem some reason to think that they may perhaps be akin to the Kambohs, though the difference must be more than one of religion only, as many of the Kambohs are Musalmán.

Abstract No. 86 on the opposite page shows some of the largest Aráin clans. I have included under the head Aráin 987 persons who have returned themselves as Bhohar, which I am informed is an Aráin clan. Of these 850 were in Multán, 34 in Montgomery, and 103 in Muzaffargarh.

487. The Kanet (Caste No. 20).—The Kanets are the low-caste cultivating class of all the eastern Himálayas of the Panjáb and the hills at their base, as far west as Kúlu and the eastern portion of the Kángra district, throughout which tract they form a very large proportion of the total population. Beyond this tract, in Kángra proper, their place is filled by Ghiraths. The country they inhabit is held or governed by Hill Rájpúts of prehistoric ancestry, the greater part of whom are far too proud to cultivate with their own hands, and who employ the Kanets as husbandmen. The Kanets claim to be of impure Rájpút origin, but there is little doubt that they are really of aboriginal stock. At the same time it is most difficult to separate them from Ráthis (*q. v.*, page 251), and in Chamba both have been included under the latter head. The whole question of their origin is elaborately discussed by General Cunningham at pages 125 to 135 of Vol. XIV of his Archæological Reports. He identifies them with the Kunindas or Kulindas of the Sanskrit classics and of Ptolemy, and is of opinion that they belong to that great Khasa race which, before the Aryan invasion, occupied the whole Sub-Himalayan tract from the Indus to the Brahmapútra, and which, driven up into the hills by the advancing wave of immigration, now separates the Aryans of India from the Turanians of Tibet. But the Kanets are divided into two great tribes, the Khasia and the Ráo, and it is probable that the Khasias are really descended from intercourse between the Aryan immigrants and the women of the hills. The process by which the great Khas tribe of Nepal thus grew up is admirably described by Mr. Hodgson in his Essay in the Military tribes of that country, which is quoted at some length by General Cunningham, and, less fully, by me at page 236 *supra*. The distinction between Khasia and Ráo is still sufficiently well marked. A Khasia observes the period of impurity after the death of a relation prescribed for a twice-born man; the Ráo that prescribed for an outcast. The Khasia wears the *janeo* or sacred thread, while the Ráo does not. But the distinction is apparently breaking down, at least in Kúlu where the two tribes freely eat together and intermarry, though the Khasia, if asked, will deny the fact.

488. Mr. Lyall thus describes the Kanets of Kúlu:—

"The Kanets are often classed by other Hindus as on a par with the Rathis of Kangra. Just as the Rathis claim to be Rajputs "who have lost grade by taking to the plough, or the offspring of Rajputs by Sudra women, so the Kanets say that they are the chil- "dren of women of the hills by Rajputs who came up from the plains. By one story both Kanets and Dagis were originally of the "same stock. Two sons of the demi-god, Bhim Sen Pándab, had each a son by the daughter of a Kulu rakhas or demon. One of "these sons married a Bhotanti, or woman of Tibet, who fed him with yak's flesh, so he and his children by her became Dagis. The "other son was ancestor of the Kanets.

"Both of these stories perhaps point to the conclusion that the Kanets and Dagis are of mixed Mughal and Hindu race. Ge- "neral Cunningham says as much of the Kanets of Kanawar, and connects the caste name with the word Karána, which implies mixed "blood. The Kanets are divided into Kassiyas and Raos. The Raos say that the origin of this division was that a Raja of Kulu "ordered the Kanets to reform their loose practices, and conform altogether to Hinduism; those who obeyed were called Kassiyas, "and those who stuck to their old ways Raos. It is a fact that at the present day the former are more Hindu in all observances "than the latter, and the story is otherwise probable, as one can see that the foreign priests round the Rajas were always striving "to make the Kulu people more orthodox Hindus, greater respecters of Brahmins, and less devoted to the worship of their local "divinities. The Kassiyas wear the *janeo*, and pretend to some superiority, which, however, is not admitted by the Raos. They in- "termarry and eat and drink together out of the same cooking pot, but not out of the same dish or plate."

Part IV.—Minor Land-owning and Agricultural Castes.

He adds that they are not tall, but strong and active, and generally have handsome figures. Some are hardly darker than Spaniards in complexion, with a ruddy colour showing in their cheeks; others are as dark as the ordinary Panjábi. Of the "so called Kanets of Láhul" he writes that they "are a mixed race, but "the Mongolian element predominates over the Indian. Many of those who live in the lower valley are "no doubt descendants of Kanet settlers from Kúlu and Bangáhal; the rest are pure Tibetan, or nearly "so." In Láhul the Kanets, like all other classes of the people, will eat cows and bullocks which have died a natural death. They never wear the sacred thread. The social status of the Kanet appears to be very low. A Sunár will marry a Kanet woman, but he will not give his daughter to a Kanet, nor will he eat from the hand of a Kanet, though his wife will do so. In Láhul even a Bráhman or Thakar will take a Kanet woman as a second-class wife, and the offspring of the latter, who are known as *Garu*, will in a few generations rank as Thakar. Those of the former however can never rise to full equality with the pure Bráhman, though they are commonly known as Bráhmans. The fathers will not eat from the hands of sons begotten in this manner, but will smoke with them.

General Cunningham says that the Kanets have three principal clans, Mangal, Chauhán, and Ráo. The Chauhán will almost certainly be Khasia. With respect to the Mangal I have no information, nor do I find it in my papers, unless Pangalána be a misreading for Mangalána or Mangal. The principal Kanet divisions returned in our papers are shown in the margin. More than half the Kásib are in Bashahr. The name belongs to a Brahminical *gotra*, and is probably no tribe at all and only returned because the heading of the schedule was misunderstood. The Chauhán are principally returned from Mandi, Suket, Náhan, Keonthal, and Jubbal; the Khasia from Bashahr and Kángra; the Pangalána from Suket; and the Punwár from Náhan. General Cunningham assigns the upper valley of the Pabar to the Chauhán, the lower Pabar, the Rúpin, and the Tons valleys to the Ráo, and the tract west of the Pabar basin to the Mangal. Mr. Anderson notes that the Khasia are more common in Kúlu proper, and the Ráo in Seoráj.

KANET TRIBES.

1. Kásib	67,233	5. Pangalána	12,067
2. Chauhán	38,585	6. Thakar	7,356
3. Ráo	32,218	7. Punwár	7,129
4. Khasia	29,285	8. Lastúri	3,859

489. The Ghirath, Bahti, and Chang (Caste No. 29).—The Ghiraths fill much the same position in Kángra proper and the hills below it as do the Kanets in the part to the east. With them I have included the Báhti and the Cháng, as it appears that one and the same people are known as Ghirath in Kángra, and as Báhti in the eastern and Cháng in the western portion of the lower ranges. All three intermarry freely, and are considered by Mr. Lyall as identical. In the Amritsar division all the Ghiraths except 128 were returned as Cháng. The Jálandhar divisional office took the three names together. The Ghiraths of Kángra and Hushyárpur are thus described by Mr. Barnes:—

"My previous remarks (quoted on page 251 under the head Ráthi) will have introduced the reader to the Girths. They "form a considerable item in the population of these hills, and in actual numbers exceed any other individual caste. With the Girths "I have associated the few Jats that reside in this district, and the Changs, which is only another name for Girths, prevalent "about Haripur and Nurpur. They amount altogether to 1,11,507 souls. The Girths are sub-divided into numerous sects. There "is a common saying that there are 360 varieties of rice, and that the sub-divisions of the Girths are equally extensive, the analogy "arising from the Girths being the usual cultivators of rice. The Girths predominate in the valleys of Palum, Kangra, and Rihlo. "They are bound again in the "Hul Doon," or Haripur valley. These localities are the strongholds of the caste, although they are "scattered elsewhere in every portion of the district, and generally possess the richest lands and the most open spots in the hills. "The Girths belong to the Sudra division of Hindus, and this fact apparently accounts for the localities wherein they are found. The "open valleys, although containing the finest lands, are also the only accessible portions of the hills. The more refined castes prefer- "red the advantages of privacy and seclusion, although accompanied by a sterner soil and diminished returns. They abandoned the "fertile valleys to less fastidious classes, whose women were not ashamed to be seen nor to work in the fields, and the men were not "degraded by being pressed as porters.

"The Girths are a most indefatigable and hard-working race. Their fertile lands yield double crops, and they are incessantly "employed during the whole year in the various processes of agriculture. In addition to the cultivation of their fields, the Girth "women carry wood, vegetables, mangoes, milk and other products to the markets for sale; many sit half the day wrangling with "customers until their store is disposed of. The men are constantly seized for begár, or forced labour, to carry travellers' loads, "or to assist in the various public buildings in course of construction. From these details it will be perceived that the Girths have "no easy time of it, and their energies and powers of endurance must be most elastic to bear up against this incessant toil.

"To look at their frames, they appear incapable of sustaining such fatigue. The men are short in stature, frequently disfigured "by goitre (which equally affects both sexes), dark and sickly in complexion, and with little or no hair on their faces. Both men "and women have coarse features, more resembling the Tartar physiognomy than any other type, and it is rare to see a handsome "face, though sometimes the younger women may be called pretty. Both sexes are extremely addicted to spirituous drinks. Al- "though industrious cultivators, they are very litigious and quarrelsome; but their disputes seldom lead to blows; and though in- "temperate they are still thrifty,—a Girth seldom wastes his substance in drink. In their dealings with one another they are "honest and truthful, and altogether their character, though not so peaceable and manly as the Rathi, has many valuable and en- "dearing traits. The Girths being Sudras do not wear the *janeo* or thread of caste. They take money for their daughters, but "seldom exchange them. The younger brother takes his brother's widow; if she leave his protection, he was entitled by the law of "the country to her restitution, and under us he should at all events receive money compensation."

The Ghiraths are said to be of Rájpút origin by mixed marriages or illegitimate intercourse, but I have no trustworthy information on the subject. They are essentially agricultural, and the proverb says:—"As "the rice bends in the ear the Ghirath lifts his head." Their social position is low. "You can no more "make a saint of a Ghirath than expect chastity of a buffalo," and they practise widow-marriage, for "You "can't make a Ghirathni a widow, any more than you can turn a hill buffalo into a barren cow."

The Ghiraths have returned few large sub-divisions. The eight largest are given in the margin. Bhárdwáj is another Brahminical *gotra*, and probably returned through misapprehension. Chhábru is found only in Hushyárpur, and Chhora and Bhattu only in Kángra. The others occur in both districts.

GHIRATH TRIBES.

1. Kandal	24,392	5. Reru	2,532
2. Bhárdwáj	8,330	6. Badiál	2,058
3. Pathári	3,091	7. Chhora	1,695

Part IV.—Minor Land-owning and Agricultural Castes.

of these titles, while tribes whose origin is lowly or has been forgotten, trace their descent from the people of the Prophet or of one of the Mahomedan conquerors of India. As Mr. Thomson puts it: "Pride of "race leads to the invention of some royal progenitor, and pride of religion is a perpetual inducement to "escape from the admission of an idolatrous ancestry."

500. The Arab (Caste No. 140).—Arabs are returned in the Panjáb chiefly from the Multán and Pesháwar divisions. They are probably Arab merchants from Bombay, where I believe men of true Arab extraction are somewhat numerous. That they have not come direct from Arabia is shown by the language table, in which Arabic is returned as the mother-tongue of only 63 persons. More than half the Arabs in the Panjáb are to be found in Pesháwar itself. This is hardly to be wondered at, for Pesháwar is a city in which may be found representatives of almost every Eastern nation, and is the half-way house between India and Asia. It is possible that some of our Shekhs, whether truly or falsely so called, may have returned themselves as

Part IV.—Minor Land-owning and Agricultural Castes.

Arabs, but I do not think it likely. The true Shekhs are of course of Arab origin; but I believe that such men, when their settlement in the Panjáb is of any long standing, always call themselves Shekh or Qureshi, and not Arab.

501. The Shekh (Caste No. 17).—*Shekh* is an Arabic word meaning an elder or Chief, and probably corresponds very closely among the tribes of Arabia with *Chaudhri* among those of the Panjáb. Thus the title should properly be confined to, and is very generally assumed by tribes of true Arab descent. But it has been degraded to a much more vulgar use. If a Rájpút or Jat turn Mahomedan he retains his caste name, and is still a Rájpút or Jat; though I have known Musalmán Rájpúts who had fallen in life and taken to weaving call themselves Shekhs, though still recognized as relations by their brethren of the village whence they came. So if an outcast or man of impure calling becomes Musalmán and retains his occupation, or at least substitutes for it another only slightly less degrading, he also retains his caste name or is known by an entirely new one, such as Díndár or Musalli. But the class which lie between these two extremes, and are neither so proud of their origin as to wish, nor so degraded by their occupation as to be compelled to retain their original caste name, very generally abandon that name on their conversion to Islám and adopt the title of Shekh. There is a Persian proverb: "The first year I was a weaver (Juláha); the next year a Shekh. This year if prices rise I shall be a Saiyad." Moreover many of the inferior agricultural Musalmán tribes of Indian descent have, especially in the west of the Province, set up a claim to Arab origin; and though they are still known by their tribal name, have probably or almost certainly returned themselves as Shekhs in the present Census. In these last cases they will in all probability have often shown their tribal name as the sub-division of the Shekhs to which they belong, and it is to be hoped that the detailed clan tribes will, when published, throw much light upon the true composition of our figures for Shekhs. Meanwhile only a few of the largest sub-divisions can be examined. In one respect I myself am responsible for the uncertainty of meaning which attaches to these figures. There are certain agricultural tribes whose claims to Qureshi origin appear to be valid, such as the Khagga and Háns of Montgomery; and these men I included under the head Shekh. It was most certainly a mistake to do so, and I shall give separate figures for them below. With them I shall discuss some of the larger sub-divisions of Shekhs which have been returned in our papers. In many cases the titles here given are no less misleading than the original title of Shekh. The Shekhs who have returned themselves as Jats in the Multán and Deraját division are shown in Abstract No. 72, page 224.

Shekhs do not bear the best of characters in some parts. In Rohtak they are said to "supply recruits to our armies and jails with praiseworthy indifference," and in Derah Ismáil Khán the Naumuslim Shekhs are described as "a lazy thriftless set of cultivators." The true Qureshis of the south-western districts, however, are often possessed of great influence, and hold a high character for sanctity. Such are the descendants of Bahá-ul-haqq the renowned saint of Multán, who are known as Háshmi Qureshis, and whose family is described at pages 490*ff* of Griffin's *Panjáb Chiefs*. They are chiefly found in the Multán, Jhang, and Muzaffargarh districts.

502. Tribes and castes included under Shekh—Qureshi.—The figures below show the number of people who have returned themselves as Qureshi:—

QURESHI SHEKHS

District and State.	Number.	District and State.	Number.	District and State.	Number.
Dehli	19,355	Lahore	13,330	Derah Ghazi Khán	1,730
Gurgaon	3,977	Gujránwála	2,343	Bannu	8,666
Rohtak	1,212	Firozpur	3,461	Pesháwar	3,601
Sirsa	1,701	Rawalpindi	12,420	Hazára	2,433
Ambála	16,629	Jahlam	3,634	Kohát	2,342
Ludhiána	1,076	Gujrát	4,000	Patiála	5,874
Simla	1,322	Sháhpur	4,276	Bahawalpur	3,901
Jalandhar	3,616	Multán	6,100	Other Districts and States	4,539
Hushyárpur	1,977	Jhang	3,987		161,854
Amritsar	12,309	Montgomery	2,199		
Gurdáspur	2,043	Muzaffargarh	3,265		
Siálkot	2,103	Derah Ismail Khán	2,436		

The Qureshi is the Arab tribe to which the Prophet belonged. Consequently it is the favourite tribe from which to claim descent, and it is to be feared that comparatively few of those who have returned themselves as Qureshi have any real title to the name. Among those who so style themselves many claim to belong to the Farúqis or descendants of Umar the second Caliph, or to the Sadíqis or descendants of Abul Bakar the first Caliph, both of whom were Qureshi by tribe. But the term Sadíqi is often confused with Sidqi, a title derived from the same root and meaning "the true"; but which, in the east of the Panjáb at any rate, is commonly used as an equivalent to Naumuslim to distinguish converts of Indian descent from original Mahomedan immigrants.

Naumuslim—means nothing more than a new Musalmán; and only 3,491 of our Shekhs have, by returning themselves as Shekh Naumuslim, admitted their true origin. These men are scattered in small numbers about the Province, but 1,437 of them are in Bahawalpur.

Ansari.—Ansári or "auxiliaries" was the title given to the believers of Medina who welcomed Mahomet after his flight from Mecca; and those who claim descent from these men style themselves Ansári. As many as 7,215 of our Shekhs have so returned themselves, of whom 1,501 are in Ambála, 1,539 in Multán, and the rest scattered about the Province. One large section of the Shekhs of Pánipat commonly style themselves Ansári; but they would appear to have now returned themselves as Muhájarín.

Muhajarin.—The faithful who accompanied Mahomet in his *Hajirah* or flight from Mecca were called Muhájarín or "the fugitives or emigrants," and their descendants still retain the title. In the Karnál district 8,560 persons have so returned themselves, and are doubtless the men of Pánipat just alluded to.

Part IV.—Minor Land-owning and Agricultural Castes.

503. The Hans and Khagga.—The Háns is one of the tribes which I regret having included among the Shekhs. The numbers according to our returns are given in the margin; but it is very probable that many of the Háns have returned themselves as Shekh or Qureshi and not as Háns, since they claim Qureshi origin. They say they emigrated from Arabia to Afghánistán and thence to the Panjáb, where they settted at Pakka Sidhár in the Montgomery district. In the time of Alamgír the Háns tribe, under their chief Shekh Qutb, attained independent rule over a portion of that district and retained their independence till the time of the Sikhs, when about the middle of the 18th century the streams which fertilized their country dried up and they lost their home. At present they do not own a single entire village, and have preserved none of their former influence.

THE HANS.

District.	Numbers.
Multan	622
Jhang	7
Montgomery	268
TOTAL	897

Khaggas.—The Khaggas are another tribe which I have classed as Shekh, but had better have kept separate. The numbers returned are shown in the margin. But here again many of them have probably returned themselves as Shekhs or Qureshi. Mr. Purser thus describes them: "The Khaggas came to the Montgomery district "after the conquest of Multán by Ranjít Singh. They claim to be Qureshi, and "name as the first Khagga, Jalál-ul-dín, disciple of Muhammad Irák. Khagga is "said to mean a peculiar kind of fish; and the name was given to Jalál-ul-dín "by his spiritual teacher on the occasion of his rescuing a boat overtaken by a "storm."

THE KHAGGAS.

District.	Numbers.
Multan	672
Jhang	5
Montgomery	172
Muzaffargarh	54
TOTAL	903

504. The Nekokara and Jhandir.—The Kokára or Nekokára, who are chiefly found in the Jhang district, claim to be Hashmi Qureshis, who came from Baháwalpur some 450 years ago. They hold land in Gújránwála also, but are not a very important tribe. In Gújránwála many of them are *faqirs*, and they generally bear a semi-religious character.

The Jhandir are also said to be of Qureshi origin, and though they do not openly profess to be religious directors, there is a certain odour of sanctity about the tribe. Most of them can read and write, and they are "particularly free from ill deeds of every description." They own land in the extreme south of the Jhang district. They are said to have been the standard bearers of one of the great saints, whence their name.

505. The Sarai, Miana, and others.—Sarai.—The Sarai family are the descendants of the Kalhora Kings of Sindh who have settled at Hájípur in Derah Gházi Khán. Some account of their history will be found in Mr. Fryer's report on that district, and in Mr. O'Brien's *Glossary*. They were included with Shekh in the divisional office, and I have no separate figures for them as yet. Tod makes the Sarai descendants, or perhaps only namesakes, of Sehl a Kaurava Rájpút, and in ancient times prince of Sindh and founder of Aror on the Indus. He says: "Sehl or Sehr became a titular appellation of the country, its "princes, and its inhabitants the Sehrai." (See further Sarai under Jats of the western sub-montane, section 433).

Miana.—Mián is used in the west of the Panjáb to denote any holy man, and his descendants will often style themselves Miána. Thus the head of the Sarai family just described is known as the Mián Sáhib Sarai. But in Hazára at least, and probably in other parts of the frontier, any new convert to Mahomedanism is often called a Miána, and most of them are cultivators. I have with some hesitation classed them as Shekh rather than with Ulama. There are 3,282 in the Ráwalpindi and 188 in the Deraját division.

RETURNED AS SHEKHS.

Name of Castes.	Number returned as Shekhs.
Bodla	2,435
Dáúdpotra	1,421
Kalál	270
Awán	449
Maliár	221
Tarkhán	118
Mochi	107
Rájpút	106
29 other castes, mostly low.	685

Besides the classes discussed above, the castes shown in the margin appear from a rough examination of the Shekh sub-divisions to have returned themselves as Shekhs in the numbers shown against each. They are described in their proper places. Of the Bodlas returned as Shekhs 144 are in Hissár, 749 in Sirsa, 339 in Fírozpur, 349 in Montgomery, and 254 in Baháwalpur. Of the Dáúdpotras 1,287 are in Multán. Besides these, men returning themselves under the following names have been classed as Shekh: Shekhra, a contemptuous diminutive of Shekh; Pírzádah, or descendants of a *pír* or Musalmán spiritual guide; Shekhzádah, or son of a Shekh. There appear to have been only 383 of the first, 19 of the second, and 17 of the third. In the Lahore division the Bharáis (caste No. 48) have been most erroneously classed as Shekh, to the number of 1,444 in Lahore, 2,256 in Gújránwála, and 1,646 in Fírozpur.

506. The Turk (Caste No. 126).—I shall not attempt to touch upon the much debated question of the distinction between Túrks and Mughals. It will be sufficient to say that a Túrk in the Panjáb means, probably invariably, a Túrkomán native of Túrkistán and of Mongolian race. In the Dehli territory indeed the villagers, accustomed to describe the Mughals of the Empire as Túrks, use the word as synonymous with "official;" and I have heard my Hindu clerks of Káyath caste described as Túrks merely because they were in Government employ. On the Biloch frontier also the word Túrk is commonly used as synonymous with Mughal. The Túrks of the Panjáb are practically confined to the Hazára district, and are doubtless the representatives of the colony of Kárlagh Túrks who came into the Panjáb with Tamarlane (1399 A.D.) and possessed themselves of the Pakhli tract in the Hazára district, which apparently included the Tanáwal, Dhamtaur, and Swáti country, and was politically attached to Kashmír. These men were dispossessed of their territory by Swátis and Tanáolis from across the Indus about the beginning of the 18th century; and the Túrks now returned are doubtless their descendants. The word Túrk is a Tartar word meaning a "wanderer;" thus in poetry the Sun is called "the Túrk of China," that is of the East, or "the Túrk of the Sky." The Túrks of Gurdáspur are said to be rope-makers by occupation (see further sections 412 and 416).

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

PART V.—RELIGIOUS, PROFESSIONAL, MERCANTILE, AND MISCELLANEOUS CASTES.

510. General and Introductory.—The classes discussed in this part of the chapter form an exceedingly heterogeneous collection. They are in fact all those that are left after separating the landowning and agricultural castes on the one hand, and the vagrant, artisan, and menial classes on the other. They include some of the highest and some of the lowest castes in the Province, yet there is a connection between the priestly Bráhman and the semi-priestly Nái, between the merchant Khatri and the pedlar Maniár. I have divided the castes now to be considered into six groups. The first includes the priestly castes such as the Bráhman and Saiyad; the second the various ascetic, religious, and mendicant orders of *faqirs;* the third the minor professional castes such as the Nái, the Mírási, and the Bhát; the fourth the great mercantile castes such as the Khatri and Arora; the fifth the carriers and pedlars such as the Banjára and Maniár; while in the sixth are included those miscellaneous castes, such as the Kashmíri and Káyath, for whom I have been unable to find a place elsewhere. The line between the merchants and shop-keepers on the one hand and the carriers and pedlars on the other is exceedingly ill-defined, both in the figures and in the facts. The groups are too diverse in their character for any general discussion of them to be profitable; and I shall consider each under its separate heading, where also will be found the figures showing their distribution throughout the Panjáb.

PRIESTLY CLASSES.

511. Priestly castes.—The group of castes which I am about to discuss, and of which the figures are given in Abstract No. 88 on the next page, may be divided into three classes, Hindu priests, Mahomedan priests, and *faqirs*. The last I give in this abstract so as to complete the group; but they will be discussed further on, and I shall confine my remarks at present to the priestly and religious castes, as distinct from orders. The Bráhmans are of course the very type of a Hindu caste, while the Pujáris of our tables probably belong for the most part to what is now a real caste, though the word itself is merely the name for an occupation. But the Mahomedan group is not so homogeneous. The title of a Saiyad should be, but notoriously is not, confined to the descendants of a common ancestor; while the Ulama are professedly a miscellaneous collection of persons returned under entries most of which should never have appeared at all in the caste column. The Chishtis again probably include both spiritual and carnal descendants of their Chief, as is the case with so many of the religious orders next to be discussed; while the Bodlas are almost certainly a clan of Rájpúts who have acquired a character for sanctity. Theoretically, the two groups should occupy very different positions among the followers of their respective faiths. The Bráhman is a priest, and entitled as such to reverence and support by the ordinances of the Hindu religion: the Saiyad merely claims respect in virtue of his descent from the son-in-law of the Prophet, and the Mahomedan religion as such has no organised priesthood. But it has already been pointed out in the Chapter on Religion that there is really little to choose between the Hindu and the Musalmán as regards the spiritual bondage in which their superstition enfolds them; and indeed that if either has the advantage, it is the former rather than the latter. The classes included under the present group are by no means purely priestly; they are also large owners and cultivators of land. But their most distinctive characteristic is their saintly character, and I have therefore separated them from the land-owning and agricultural classes. At the same time the distinction between the Saiyad and the Qureshi Shekh as regards the spiritual reverence paid them is probably, at least in the south-western districts, exceedingly small.

512. The Brahman (Caste No. 3).—The Bráhman or Levite of the Hindu caste system is the third most numerous caste in the Panjáb, outnumbering all but Jats and Rájpúts. I shall not attempt to discuss his origin and theoretical position; much has been written and published concerning him, the first hundred pages of Sherring's first volume and the whole of the second volume of Wilson's *Indian Caste* are devoted to him alone, and Colebrooke's Essays contain much valuable information on the subject. The figures of Abstract No. 88 showing the distribution of the caste in the Panjáb are very striking. The proportion of Bráhmans to total population reaches its maximum in the hills of Kángra and Simla, the most Hindu portion of the Province, where it rises as high as from 13 to 15 per cent. Throughout the remainder of the Panjáb the proportion steadily changes with the prevailing religion. It is highest in the sub-montane and Jamna tracts where the people are essentially Hindus; it gradually decreases from east to west, being markedly smaller in the central and Sikh districts; it is still smaller in the cis-Indus Salt-range Tract; while in the Western Plains and beyond the Indus the Bráhmans may be said comparatively speaking to disappear. The Bráhmans have no territorial organisation. They accompany their clients in their migrations, settle with them in their new homes, and receive grants of land to hold or cultivate.

The function and position of the Bráhman in his sacerdotal character have been already described in the Chapter on Religion, section 236. He concerns himself but little with the spiritual guidance of the people, but he is consulted as to omens and auspicious names, dates, and events, and he officiates at all ceremonial functions. These duties however employ, except perhaps in the west of the Province, but a small proportion of the total number; and the remainder are pure Levites, ready to be fed or receive offerings in the name of God, but their sacerdotal functions being purely passive. These men supplement

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

the offerings of their clients by practising agriculture very extensively; and it may be said that wherever the Bráhmans are numerous they are, excepting only the educated Pandits or Pádhas, land-owners and cultivators. They are poor husbandmen, for their pride of caste and the fact that a large part of their subsistence comes to them without the necessity of toil render them impatient of manual labour; and like the Rájpúts they look upon the actual operation of ploughing as degrading, insomuch that in the hills a Bráhman who ploughs is scarcely recognised as a brother by the higher classes of the caste. In social position the Bráhman is of course pre-eminently first in the Hindu portion of the Panjáb, though he is thought but meanly of on the frontier. Yet even where his position is most readily admitted he has failed to make himself beloved. He is grasping, quarrelsome, and overbearing, inflated with pride in his own descent and contempt for that of others, while he holds himself aloof from the clients whose pockets he preys upon, and declines to associate himself with the community upon which he lives. "A Dúm, a Bráhman, and a goat "are of no avail in time of need." Where Bráhmans hold any considerable share of a village trouble and disputes are sure to follow; and the villagers have a proverb: "As famine from the desert, so comes evil from a Bráhman." So their avarice is expressed in the saying—"The Mulla, the Bhát, the "Bráhman, and the Dúm; these four castes were not born on giving day," and their love of good living by the proverb: "Dine with a Bráhman and jog along the road with a Kirár" (the Kirárs being great talkers). On the whole the Bráhman has but little real influence over the Hindu peasant, and the reverence paid him is largely traditional or due to the conservative tendency of the women. The Bráhmans of the hills have a social and tribal organisation almost exactly corresponding with that of the hill Rájpúts. The quotations from Mr. Barnes given at pages 175 and 179 bear upon the subject. They too are divided into grades, each grade marrying from the one below and giving their daughters to the one above, while the lower classes will marry Káyath or Banya, and in Kúlu even Kanet women. The mixed class of Pahári Mahájans is described below under mercantile castes. In the hills of Hazára on the banks of the Jahlam these Mahájans, who are also called Dhakochi, seem to include the whole Bráhman caste. In the Pesháwar division 185 persons are returned as Bráhman-Mahájans, and these I have classed as Bráhmans. It is probable that some of the Pahári Mahájans also are really Bráhmans. The Hill Bráhmans universally eat meat, from which the Bráhmans of the plains, except perhaps in the extreme west, scrupulously abstain. Of the total number of Bráhmans only about 7,000 are returned as Sikh, the denial of the superiority claimed by the higher castes which distinguished the teaching of Guru Govind not being acceptable to the Bráhman. The Sikhs employ Hindu Bráhmans as their *parohits* or family priests in exactly the same way as do the Hindus and Jains. There are also 3,500 Musalmán Bráhmans, chiefly in the Dehli district. These men are known as Huseni Bráhmans, and are said to receive oblations in the name of the Hindu gods from Hindus and in the name of Alláh from Musalmáns.

513. The divisions of the Brahmans.—The Brahminical *gotras* have already been described in section 353. The Bráhman caste or class is divided into ten great sections, all based upon geographical distribution, which differs in customs and standing and do not intermarry. They again are divided into two groups each containing five sections, as follows:—

A.—The five Dravidas (south of the Vindhyas).

1. The Maháráshtra (of the Mahratta country).
2. The Tailanga or Andhra (of the Telugu country).
3. The Dravida (of the Tamil or Dravida country).
4. The Karnáta (of the Carnatic).
5. The Gurjara or Gújaráti (of Gújarát in Sindh).

B.—The five Gaurs (north of the Vindhyas).

6. The Gaur (of Gaur, probably not Bengal, *see below*).
7. The Sáraswat or Sársút (of the Panjáb, beyond the Saruswati).
8. The Kanyakubja (of Kanauj).
9. The Maithila (of the Mithila country).
10. The Utkala (of Orissa).

Of these great divisions the Panjáb Bráhmans belong for the most part to the Gaur in the Jamna and south-eastern districts and the eastern hills, and to the Sársút in the remainder of the Province. The figures are given below in Abstract No. 89, a few districts in which only small numbers are shown being omitted. It may be said that a line drawn north-east and south-west through Simla and Patiála roughly divides the Gaur from the Sársút. I append a description of some of the principal divisions of the Bráhmans to be met with in the Panjáb, and must refer the reader for fuller details to the authorities quoted in the beginning of section 512.

The Gaur Brahman.—There has been much dispute about the position of the Gaur from which this section is named. Their traditional place of origin is Hariána, and their present home is the portion of the North-West Provinces lying west of Aligarh and Mathra, and the part of the Panjab defined above; and they are separated from Bengal by other sections of the caste. General Cunningham suggests that Gaur is the old name of Gonda, while Sir George Campbell would make it another form of the word Ghaggar. The Gaur Bráhmans are far more strict in all caste observances than the Sársút Bráhmans, from whose hands they will not eat bread, and upon whom they look down.

The Sarsut Brahman is the Bráhman of the Panjáb Proper, and takes his name from the Saruswati which lies near his eastern boundary. He is said to be less grasping and quarrelsome than the Gaur, and he is certainly much less rigid in his observance of caste rules, eating and smoking with most of the stricter Hindu castes, such as Banyas, Khatris, Súds, and Káyaths. He eats flesh in the hills, and perhaps in some parts of the plains also.

The Gujarati and Dakaut Brahmans.—These men are scattered in small numbers all over the Province. The Gújaráti Bráhmans probably belong to the Gurjara section already mentioned. The Dákaut or Dakotra Bráhmans are fortune-tellers and astrologers, and came from Northern Rájpútána. They belong to the Panj Gaur group, of which they are sometimes, in Rájpútána which is their home, reckoned as a separate section. The following description is taken from my Karnál Report:—

"Offerings to Bráhmans are divided into *bár* and *graha* for the days of the week, and two *grahin* for Ráhu and Ket, the two "demons who cause eclipses by attacking the sun and moon. These two are parts of a jiu (Rákshas), who, when sitting at dinner "with the gods and jins, drank of the nectar of the gods instead of the wine of the jins. The sun and moon told of him, and "Bhagwán cut him into two parts, of which Ráhu, including the stomach and therefore the nectar, is the more worthy. When "anybody wishes to offer to Bráhmans from illness or other cause, he consults a Bráhman who casts his horoscope and directs which "offering of the seven *grahas* should be made. The *grahins* are most commonly offered during an eclipse, that to Ráhu being given "at the beginning, and that to Ket at the end of the transit. The Gaur Bráhmans will not take any black offerings, such as a "buffalo or goat, iron, sesame (*til*) or *urad*, black blankets or clothes, salt, &c., nor oil, second-hand clothes, green clothes, nor "*satnája*, which is seven grains mixed with a piece of iron in them; these belonging to the *grahe* whose offerings are forbidden to "them. An exception, however, is made in favour of a black cow.

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

lower and middle Satluj, who have for some generations enjoyed a character for peculiar sanctity, and who now claim Qureshi origin from Abu Bakr Sadíq; and 2,435 of them have entered themselves as Qureshi and not as Bodla, and are included under the head Shekh. Of these 144 are in Hissár, 749 in Sirsa, 339 in Fírozpur, 349 in Montgomery, and 254 in Bahâwalpur. They still marry Wattu girls, though they give their daughters only to Bodlas. They were till lately a wholly pastoral tribe, and still hold a *jágír*, the proceeds of which they now supplement by cultivation. They came up from Multán through Bahâwalpur to Montgomery, where they are described by Mr. Purser as "lazy, silly, and conceited." From Montgomery they spread into Sirsa, where they occupied the Bahak *parganah* which they still hold. They are credited with the power of curing disease by exorcism, and especially snake-bite and hydrophobia; they are recognised saints, and can curse with great efficacy. They have no relations with the other Qureshis of the neighbourhood, and their Wattu origin is undoubted.

ASCETIC AND MENDICANT ORDERS.

520. The ascetic and mendicant orders.—I now turn to the consideration of that section of the community which is commonly included under the generic term of Faqír. I must first point out that our figures, though representing with fair accuracy the total numbers of this class, are wholly imperfect so far as the details are concerned. The divisional offices included the various orders under the general term, but that was easily remedied. I have had them picked out again, and have given the numbers to be added on this account to the figures of Table VIIIA in each case in the following paragraphs. But the real reason of the failure of our figures to show details is, that the great mass of these *faqírs* entered the name of their order not under "tribe" but under "sect;" and as we were forbidden to tabulate any sects except Shíah, Sunni, Wahhábi, and Faràzi, the details were not worked out at all. If I had known how largely this had been the case, I should not have tabulated separately even the few orders that are shown in Table VIII A, as the figures are utterly misleading; and for this reason I do not give details of Faqírs in my Abstract on page 280.

The figures for Faqírs comprehend at least three if not four very different classes of people. First come the religious orders pure and simple. Many of these are of the highest respectability; the members are generally collected in monasteries or shrines where they live quiet peaceful lives, keeping open house to travellers, training their neophytes, and exercising a wholesome influence upon the people of the neighbourhood. Such are many at least of the Bairágis and Gosáins. Some of the orders do not keep up regular monasteries, but travel about begging and visiting their disciples; though even here they generally have permanent head-quarters in some village, or at some shrine or temple where one of their order officiates. So too the monasterial orders travel about among their disciples and collect the offerings upon which they partly subsist. There is an immense number of these men whose influence is almost wholly for good. Some few of the orders are professedly celibate, though even among them the rule is seldom strictly observed; but most of the Hindu orders are divided into the Sanyogi and Viyogi sections of which the lattter only takes vows of celibacy, while among the Musalmán orders celibacy is seldom even professed. Such however as live in monasteries are generally if not always celibate. The professed ascetics are called Sádhs if Hindu and Pírs if Musalmán. The Hindus at any rate have their neophytes who are undergoing probation before admission into the order, and these men are called *Chela*. But besides these both Hindu and Musalmán ascetics have their disciples, known respectively as *Sewak* and *Murid*, and these latter belong to the order as much as do their spiritual guides; that is to say a Káyath clerk may be a Bairágí or a Pathán soldier a Chishti, if they have committed their spiritual direction respectively to a Bairágí and Chishti *guru* and *pír*. Now it is not probable that such men have returned the name of the order as their caste, though this may occasionally have happened; and it is certain that none of them have returned themselves as Faqír. Thus so far the orders are made up of men who have voluntarily entered them, renouncing caste and worldly pursuits. But these men marry and have *bindi* or carnal children; while their *nâdi* or spiritual children, the *chelas* just mentioned, may after admission to the order return to their homes. And it often happens that the descendants, whether carnal or spiritual of a Bairágí, for instance, will grow into a separate caste known by the name of Bairágí, but having no connection whatever save by origin with the order of that name. Such men would return their caste as Bairágí, and will have been included under Faqír. How far this custom is general I cannot say; but we have just discussed one instance of it in the case of the Chishti of Montgomery, and I know of villages held by Bairágis under precisely similar circumstances in Karnál.

I have said that many of the members of these orders are pious, respectable men whose influence is wholly for good. But this is far from being the case with all the orders. Many of them are notoriously profligate debauchers, who wander about the country seducing women, extorting alms by the threat of curses, and relying on their saintly character for protection. Still even these men are members of an order which they have deliberately entered, and have some right to the title which they bear. But a very large portion of the class who are included under the name Faqír are ignorant men of low caste, without any acquaintance with even the general outlines of the religion they profess, still less with the special tenets of any particular sect, who borrow the garb of the regular orders and wander about the country living on the alms of the credulous, often hardly knowing the names of the orders to which the external signs they wear would show them to belong. Such men are mere beggars, not ascetics; and though their numbers are unfortunately large, we have no means of separating them. Besides the occupations described above, the Faqír class generally have in their hands the custody of petty shrines, the menial service of village temples and mosques, the guardianship of cemeteries, and similar semi-religious offices. For these services they often receive small grants of land from the village, by cultivating which they supplement the alms and offerings they receive.

The subject of the religious orders of the Hindus is one of the greatest complexity; the cross divisions

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

between and the different meanings of such words as Jogi, Sanyási, and Sádh are endless; and no one who was not deeply versed in the sectarian system of Hinduism could hope to deal with the subject fully. I shall therefore not attempt to do more than jot down a few rough notes on some of the most important orders. The student will find a mass of information on the subject in Wilson's *Sects of the Hindus;* while Trumpp in his introduction to his *Adi Granth*, and Cunningham in an Appendix to his *History of the Sikhs* give many particulars about the Sikh sects and orders.

521. The Hindu orders of ascetics.—The Bairagi (Caste No. 53).—Bairági, or as it is more correctly spelled Vairági, signifies any one devoid of passion. But the word is usually applied in the Panjáb to a regular order of Vaishnava devotees, said to have been founded by Sri Anand, the 12th disciple of Rámanand. They are divided into several sections, among which may be mentioned the Rámanandi who worship Rám Chandra, the Rádhabalabhi who especially affect the worship of Rádha the wife of Krishna, the Nimanandi whose chief object of reverence is Sálig Rám, and the Rámanúji who adore Mahádeo; though these last two would appear to be Saiva rather than Vaishnava. They are for the most part collected in monasteries and are an exceedingly respectable class of *faqírs*, but many of the wandering mendicants also call themselves Bairágis. Their distinctive mark is a string of brown crinkled beads. They are most numerous in the Jamna districts, though to the figures of Table VIII A must be added 2,238 males and 1,621 females who returned themselves as *faqírs*, and who are to be found in almost equal numbers in the Amritsar, Lahore, and Firozpur districts. The Bairágis of the monasteries are often but not always celibate. But there are in Karnál, and perhaps in other parts of the Province, villages held by descendants of both the children and the disciples of the Bairági monks, who have dropped their original castes and are now known as Bairágis, though they have no longer any connection with the order.

The Sanyasi (Caste No. 95).—The word Sanyási really means nothing more than the ascetic stage through which every Bráhman should properly pass. But as commonly used it corresponds among the followers of Siva with Bairági among the followers of Vishnu, and is as indefinite in its meaning. It is indeed specially applied to the Tridandi Rámanújas, a Vaishnava sect; but it is also used to include all Saiva classes of ascetics except perhaps the Jogi. In the Panjáb the word is commonly used to denote the followers of Shankar Achárj, and would include the Gosáins. The Sanyásis are said to be ordinarily buried in a sitting posture, and not burnt. To the figures of Table VIII A must be added 1,824 males and 727 females, about half of whom are in the Amritsar and another quarter in the Lahore division. The Sanyásis, so far as our figures go, seem specially to affect the districts of the eastern sub-montane.

The Gosain (Caste No. 102).—The Gosáin is a Saiva order corresponding in many ways with the Bairágis among Vaishnavas. Like them the Gosáins are often collected in monasteries, while many of them officiate as priests in the temple of Siva. They are also like the Bairágis, one of the most respectable of the Hindu orders. They are very commonly but not at all necessarily celibate. To the figures of the table must be added 1,368 males and 594 females, almost all in the Hissár district. The Gosáin appears to be almost confined to the South-eastern districts.

The Sadh (Caste No. 155).—Sádh is properly nothing more than the Hindu equivalent of the Musalmán word *Pir;* or rather Sádh applies only to a Hindu devotee, while *Pír* includes any Mahomedan holy man. But the word is especially applied to a set of Hindu Unitarians who are chiefly found in the Upper Ganges-Jamna *doáb*, from Farrúkhábád upwards. The sect was founded by one Bírbhán some 200 years ago. The Sádhs do not smoke, and affect great personal cleanliness, and their religious ceremonies consist in eating together. It is a sect rather than an order, and the Jats of a large village in Karnál are Sádhs by sect, though Jats by caste. (*See* Wilson's *Hindu Sects*, pages 227*ff*.) To the figures of the tables must be added 100 men and 13 women, mostly in the Hissár district. Our figures show Sádhs chiefly for the Dehli district and Rohtak, which would appear to connect them with the Sádh sect; yet the paucity of females show that the figures refer to a religious order. The priests of the menial classes are often called Sádh, as the Chamarwa Sádhs of the Chamárs, or the Charandási Sádhs and the Kabírbansi Sádhs of the Juláhas.

The Jogi.—The Jogi will presently be discussed under the head of *Minor Professional Castes*. It will there be explained that the word originally means nothing more than one who has by the practice of mental abstraction acquired the power of clairvoyance and similar faculties. But besides the low-class Jogi Ráwal there described, there are two sets of exceedingly respectable Jogi Faqírs, the Kanphatta who pierce their ears and the Augar who do not. The former are priests of Siva and are generally to be found in Shiválas. The latter too are Saiva, but are more secular. The Kanphatta is also called Darshana. The figures for Jogi given in Table VIII A include 3,658 males and 1,750 females of the Kanphatta, and 1,720 males and 1273 females of the Augar clan, but these figures are of course exceedingly incomplete. The Jogis bury their dead in a sitting posture.

The Aghori or Aghorpanthi—is an order which has happily almost died out. My figures show 316 only; but I have been told by an intelligent native that he can remember that in his youth they were common objects, wandering about the streets stark naked leading a jackal by a string, smeared with blood and human ordure, and carrying the same substances in a skull with which to bespatter him who refused them alms. Not two years ago one of these wretches was caught at Rohtak in the act of devouring the body of a newly buried child which he had dug out[1].

522. The Sikh orders of ascetics.—The Suthra Shahi (Caste No. 163).—This order was founded by a Bráhman called Sícha under the auspices of Guru Har Rai[2]. They are now numerous and widely distributed, though our figures, to which must be added 112 males and 15 females, show only a small number scattered through the Sikh tract. They are notorious for gambling, thieving, drunkenness, and debauchery, and lead a vagabond life, begging and singing songs of a mystic nature. They wear ropes of black wool on the head and neck, and beat two small black sticks together as they beg. Although a Sikh order, they are all entered as Hindus, use the Hindu *tilak* or sectarian mark, and follow the Hindu rites throughout. They were founded before the time of Guru Govind, which probably accounts for their calling themselves Hindus. They generally add Sháh to their names. Trumpp says of them "there is no order or regular discipline among them, and profligates and vagabonds join them. They are a public nuisance and disavowed by the Sikhs."

The Udasi (Caste No. 84).—The Udási or Nánakputra were founded by Sri Chand, the eldest son of Bába Nának, and excommunicated by the second Guru, Amr Dás. They again, being founded before the time of Guru Govind, have for the most part returned themselves as Hindus. To the figures of Table VIII A must be added 7,127 males and 1,944 females. They are almost confined to the Sikh tract. They are for the most part celibate, and the naked section or Udási Nanga are always so. They practise Hindu rites, wear the *tilak* or sect-mark, and reject the Granth of Guru Govind but revere the Adi Granth of Bába Nának. They are hardly recognised as Sikhs. They are said to bear a high character, and are sometimes collected in monasteries, though not usually so. Many live at home, engage in worldly pursuits, and differ little from their neighbours. So at least says Trumpp.

The Nirmala (Caste No. 152).—The Nirmalas or 'without stain' were originally strict Sikhs and followers of Guru Govind. They wore white clothes, lived chiefly at the centres of Sikhism, and had considerable influence in the Sikh councils. But they have of late years relapsed into Hinduism, and have taken to wearing red clothes and practising Hindu rites, and they are now hardly true Sikhs. The greater part of them, however, have returned themselves as Sikhs. They live almost entirely in monasteries and are almost always celibate. They do not beg, but live on the offerings of the faithful. They have a high reputation for morality, and used to be much respected at Amritsar, where there is a considerable Nirmala community, for purity of morals, though it is said that they are now degenerating. They are governed by a Council known as the Akhára which makes periodical visitations of the Nirmala Societies throughout the Panjáb, and is controlled by a head abbot or *Mahant*. To the figures of the table must be added 1,587 males and 500 females, of whom 500 are in Amritsar and 300 in Jálandhar. They are confined to the Sikh tract. It is said that the Nirmalas and the Udásis are not unfrequently confused.

The Akali or Nihang.—These famous soldier-fanatics, who were the Gházis of the Sikhs, are represented in my tables by a total of 547 which is of course absurd. They were *nihang* or 'reckless' soldiers of the *akál* or 'Immortal;' and Phúla Singh Akáli was Ranjit Singh's great leader. The order was founded by Guru Govind in person, and it was they who withstood the attempted

[1] Query. What is the derivation of [illegible]?
[2] Wilson says they look up to Teg Bahádur, the father of Guru Govind, as their founder; but Trumpp who is quoted in the text is more probably right.

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

innovations of Banda. They wear blue chequered clothes, bangles of steel on the wrist, and quoits of steel on their conical blue turbans, together with miniature daggers, knives, and an iron chain. Their head-quarters used to be at Amritsar, where they assumed the direction of religious ceremonies and the duty of convoking the council of the Khálsa. They were dreaded even by the Sikh Chiefs for their fanaticism and turbulence, and often levied offerings by force. They were warrior-priests, and political rather than religious, and the order is now fast dwindling away. Their present head-quarters are said to be at Anandpur in Hushyárpur. They still pride themselves upon the purity with which they preserve the original ordinances of their religion, rejecting all Hindu rites even in their marriage ceremonies. They still bear in their memories the ancient glory of the Sikhs, and an Akáli who wishes to imply that he is alone will say that he is 'with 1,25,000 Khálsa.'

The Diwana Sadh or "mad saints" wear uncut hair, a necklace of shells, and a very large feather in their turbans. They are chiefly recruited from low castes, and are for the most part married. In their habits they resemble Sikhs, but they revere the Adi Granth only. My figures show 495 males and 346 females, most of whom are in the Kángra district.

523. The Musalman order of ascetics—The Bharai (Caste No. 48).—The Bharáis, or Pirháis or Piráhis as they are often called, are the priests of Sakhi Sarwar Sultán, and have been already alluded to in section 221 in the chapter on Religion. The Bharáis of the Lahore division were included under Shekh in the divisional office; they number 1,444 in Lahore, 2,256 in Gújránwála, and 1,646 in Firozpur. The Bharáis are almost confined to the central and sub-montane districts and states, where the Sultáni belief is most prevalent. There are however a few in the districts of the Western Plains. They go about beating a drum and begging in the name of Sakhi Sarwar, and conduct parties of pilgrims to the shrine at Nigáha. They also receive the offerings of the local shrines. They circumcise boys in the western districts, and often act as Mirásis with whom they are sometimes confused. Indeed on the lower Indus they supersede the Nái as circumcisors, and are said to take their name from the fact that the Prophet gave his coat (*pairáhan*) to one of their ancestors as a reward for circumcising a convert after a barber had refused to do so! The real origin of the name is probably to be found in the fact that the pilgrims to Nigáha call each other *Pír bhra* or "Saint-brothers."

The Madari (Caste No. 63).—The Madáris are followers of Zindah Sháh Madár, the celebrated saint of Makanpur in Oudh. His name was Bázi-ul-dín Sháh, and he was a converted Jew who was born at Aleppo in A.D. 1050, and is said to have died at Makanpur at the mature age of 383 years after expelling a demon called Makan Deo from the place. He is supposed by some to be still alive (whence his name), Mahomet having given him the power of living without breath. His devotees are said never to be scorched by fire, and to be secure against venomous snakes and scorpions, the bites of which they have power to cure. Women who enter his shrine are said to be seized by violent pain as though they were being burnt alive. To the figures of Table VIII A. must be added 20,968 males and 17,476 females, of whom some 5,700 are in Ambála, 5,400 in Ludhiána, 6,600 in Jálandhar, 2,000 in Hushyárpur, 3,200 in Amritsar, 2,300 in Siálkot, and 1,500 in Firozpur. Thus they are very generally distributed throughout the eastern half of the Panjáb. In the four western divisions they seem to be almost unknown. They wear their hair matted and tied in a knot, and belong to the *be shara* section of Mahomedan orders, who regard no religion, creed, or rules of life, though they call themselves Musalmán.

The Malang are said to be a branch of the Madári. My tables show only 851 males and 659 females under that head, mostly in Patiála, Maler Kotla, Jálandhar, and Firozpur.

The Benawa (Caste No. 111).—The Benawa *faqírs* are the followers of Khwájah Hasan Básri; but who he is I cannot say unless he be the same as Hasan Básri of Básra near Bághdád, the founder of the Sarwardia order. To the figures of the table must be added 2,483 males and 2,153 females. The Benawa are almost entirely confined to the Jamna districts and Rohtak.

The Darvesh (Caste No. 136).—Darvesh is simply another word for *faqír*, and means one who begs from door to door (*dar* "door"). But the Darvesh of our tables, to the figures of which 84 males and 106 females, chiefly from Siálkot, must be added, are a peculiar class found only in Batála and Pathánkot and in Amritsar and Kapúrthala. There seems to be a colony of these men who are distinguished by the title of Darvesh. They cultivate a little land, play musical instruments, beg, make ropes, go to a house where there has been a death and chaunt the praises of the deceased, hang about mosques, and so forth. They are hardly ascetics, yet the small number of women seem to show that they have not yet formed into a separate caste, and are still recruited from outside.

The Jalali (Caste No. 143).—The Jaláli order was founded by Saiyad Jalál-ul-dín of Bukhára, though the Panjáb Jaláli are sometimes said to be followers of Sher Sháh Saiyad Jalál of Uchh, himself a Jaláli *faqír*. To the figures of the table must be added 2,322 males and 1,928 females, mostly from the Jálandhar, Amritsar, and Lahore divisions. Candidates for admission to the order shave completely, burn their clothes, and are branded on the right shoulder. The Jaláli are common in Central Asia.

The Husaini (Caste No. 160).—The Husainis are confined to Gurgáon, and present the peculiarity of having more females than males among their numbers. I have no information regarding them. They may perhaps be Husaini Saiyads.

The Qadiri (Caste No. 175).—The Qádiri are the followers of the celebrated Saiyad Abdul Qádir Pír Dastagír, whose shrine is at Bághdád; most of the Sunni divines of the North-West Frontier are Qádiri, and the Akhúnd of Swát belongs to the order. To the numbers shown in Table VIII A must be added 2,710 males and 2,181 females, for the most part in the Ambála Amritsar, and Lahore divisions. They sit for hours repeating the following declaration: "Thou art the guide, thou art the truth, there is none but thee!"

The Naqshbandia are followers of Khwájah Pír Muhammad Naqshband. My figures only show 287 males and 219 females, chiefly in the Amritsar Division. They worship by sitting perfectly silent and motionless, with bowed head and eyes fixed on the ground.

The Sarwardia.—(*See above under* "*Benawa*").—"They are the followers of Hasan Básri of Básra near Bághdád. They worship seated, chaunting at short intervals and in measured tones the word *Alláhu*, which is articulated with a suppressed breath and as if ejaculated by a powerful effort. The devotee often faints with the exertion.

The Chishti.—(*See section* 518 *above*)—Besides those classed under Chishti, my figures give 2,329 males and 2,014 females, almost all in the eastern half of the Province. The Chishti *faqírs* are the followers of Banda Nawáz whose shrine is at Kalbargah. They worship by leaping up and gesticulating, and repeating '*Alláh Yá-allá-hú*,' till they work themselves into a frenzy and at last sink down exhausted.

MINOR PROFESSIONAL CASTES.

524. The minor professional castes.—I have felt great doubt as to how I should class and where I should place the castes which I have included in this group, and the distribution of which is shown in Abstract No. 90 on the next page. Many of them are in some measure allied to the priestly classes, they have functions to perform in connection with weddings and similar ceremonies, they receive customary fees for the performance of those functions, and they are invested with a sort of *quasi*-sacred character. On the other hand, they have many points in common with the menials; their social status is very low, and many of them are retained by the villagers on the same footing as the ordinary village servants, their rights and duties being regulated by custom. The castes of the group may be divided into three classes, the Nái, Bhát, and Mírási who are real village servants though of a very special character; the Jogis and Ráwals who are for the most part astrologers and semi-religious; and the Bahrúpias and Bhánds who are actors and story-tellers, and purely professional.

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

Dera Nának in Gurdáspur where Bába Nának settled and died, and of the Sodhis at Anandpur in Hushyárpur, which is also the great centre of the Nihang devotees.

541. The Khakha (Caste No. 179).—Khakha is said to be a not uncommon epithet to apply to any petty Khatri trader. But the people to whom our figures refer are now sufficiently distinct, though their Khatri origin is, I believe, undoubted. They are in fact converted Khatris, and are found in greatest numbers in the Kashmír hills lying along the left bank of the Jahlam; whence a few have made their way into Hazára and Ráwalpindi. Sir George Campbell calls them "a curiously handsome people."

542. The Bhatia (Caste No. 69).—The Bhátias are a class of Rájpúts, originally coming from Bhatner, Jaisalmer, and the Rájpútána desert, who have taken to commercial pursuits. The name would seem to show that they were Bhátis (called Bhatti in the Panjáb); but be that as it may, their Rájpút origin appears to be unquestioned. They are numerous in Sindh and Gújarát where they appear to form the leading mercantile element, and to hold the place which the Aroras occupy higher up the Indus. They have spread into the Panjáb along the lower valleys of the Indus and Satluj, and up the whole length of the Chanáb as high as its debouchure into the plains, being indeed most numerous in Siálkot and Gújrát. In this Province however they occupy an inferior position, both in a social and in a mercantile sense. They stand distinctly below the Khatri and perhaps below the Arora, and are for the most part engaged in petty shop-keeping, though the Bhátias of Derah Ismáíl Khán are described as belonging to a "widely spread and enterprising mercantile community." They are often supposed to be Khatris, and in Jahlam they are said to follow the Khatri divisions of Báhri, Bunjáhi, Dhaighar, Chárzáti, &c. They are very strict Hindus; far more so than the other trading classes of the Western Panjáb; and eschew meat and liquor. They do not practise widow-marriage.

543. The Arora (Caste No. 10).—The Arora, or Rora as he is often called, is the trader *par excellence* of the Jatki-speaking or south-western portion of the Panjáb, that is to say of the lower valleys of our five rivers; while higher up their courses he shares that position with the Khatri. East of the upper Satluj he is only found in the immediate neighbourhood of the river. More than half the Aroras of the Panjáb dwell in the Multán and Deraját divisions. Like the Khatri, and unlike the Banya, he is no mere trader; but his social position is far inferior to theirs, partly no doubt because he is looked down upon simply as being a Hindu in the portions of the Province which are his special habitat. He is commonly known as a Kirár, a word almost synonymous with coward, and even more contemptuous than is the name Banya in the east of the Province. The word Kirár, indeed, appears to be applied to all the western or Panjábi traders, as distinct from the Banyas of Hindústán, and is so used even in the Kángra Hills. But the Arora is the person to whom the term is most commonly applied, and Khatris repudiate the name altogether as derogatory. The Arora is active and enterprising, industrious and thrifty. "When an Arora girds up "his loins, he makes it only two miles (from Jhang) to Lahore." He will turn his hand to any work, he makes a most admirable cultivator, and a large proportion of the Aroras of the lower Chanáb are purely agricultural in their avocations. He is found throughout Afghánistán and even Túrkistán, and is the Hindu trader of those countries; while in the Western Panjáb he will sew clothes, weave matting and baskets, make vessels of brass and copper, and do goldsmith's work. But he is a terrible coward, and is so branded in the proverbs of the countryside: "The thieves were four and we eighty-four; the thieves came on and we ran away. Damn the thieves! Well done us!" And again: "To meet a Ráthi armed with a "hoe makes a company of nine Kirárs feel alone." Yet the peasant has a wholesome dread of the Kirár when in his proper place. "Vex not the Jat in his jungle, or the Kirár at his shop, or the boatman at his ferry; for if you do they will break your head." Again: "Trust not a crow, a dog, or a Kirár, even "when asleep." So again: "You can't make a friend of a Kirár any more than a *Satti* of a prostitute." The Arora is of inferior physique, and his character is thus summed up by Mr. Thorburn: "A cowardly, secre- "tive, acquisitive race, very necessary and useful it may be in their places, but possessed of few manly "qualities, and both despised and envied by the great Musalmán tribes of Bannu." A few of the Aroras are returned as Musalmán, some 7 per cent. as Sikh, and the rest as Hindu. But many of the so-called Hindus, especially on the lower Chanáb and Satluj, are really Munna (shaven) Sikhs, or followers of Bába Nának, while the Hindu Aroras of the Indus worship the river. Further details will be found in sections 240 and 264 of Chapter IV on the Religions of the people.

544. Origin and divisions of the Aroras.—The Aroras claim to be of Khatri origin, and it will presently be seen that they follow some of the Khatri sub-divisions[1]. The Khatris however reject the claim. Sir George Campbell (see section 539) is of opinion that the two belong to the same ethnic stock. They say that they became outcasts from the Kshatriya stock during the persecution of that people by Paras Rám, to avoid which they denied their caste and described it as *Aur* or another, hence their name. Some of them fled northwards and some southwards, and hence the names of the two great sections of the caste, Uttarádhi and Dakhana. But it has been suggested with greater probability that, as the Multán and Lahore Khatris are Khatris of Multán and Lahore, so the Aroras are Khatris of Aror the ancient capital of Sindh, now represented by the modern Rori. The number of clans is enormous, and many of them are found in both sections. The Uttarádhi and Dakhana do not intermarry, the section being endogamous and the clan, as usual, exogamous. All Aroras are said to be of the Kásib *gotra*. The women of the northern or Uttarádhi section wear red ivory bracelets, and the section is divided into two sub-sections called Báhri and Bunjáhi (see Khatri divisions, section 540). The women of the southern or Dakhana section wear white ivory bracelets, and the section is divided into two sub-sections, the Dahra and the Dakhanadháin; but the Dahra sub-section is so important that it is often counted as a third section, and the term Dakhana applied to the Dakhanadháins alone. So it is said that in some places the Dahra women alone wear white, and the Dakhana women spotted bracelets of both colours. The Báhri and the Dakhanadháin claim social superiority, and will take wives from, but not give daughters to, the other sub-section of their respective sections. The figures are given in Abstract No. 93 on the next page. It will be noticed that the Dakhanas are far strongest in the southern and south-western districts.

[1] The detailed figures, when published, will show how far the identity of divisions extends.

545. The Khojah and Paracha (Caste Nos. 44 and 104).—The word Khojah is really nothing more than our old friend the Khwájah of the *Arabian Nights*, and means simply a man of wealth and respectability. In the Panjáb it is used in three different senses: for a eunuch, for a scavenger converted to Islám, and for a Mahomedan trader[1]. It is in the last sense that it is used in our tables. There does not appear to be any true *caste* of Khojahs, any Hindu trader converted to Mahomedanism being known by that name. Thus the Khojahs of Sháhpur are almost entirely Khatris, and a Khatri now becoming a Musalmán in that district would be called a Khojah. The Khojahs of Jhang, on the other hand, are said to be converted Aroras; while some at least of the Lahore Khojahs claim Bhátia origin, and one section of the Ambála Khojahs are Káyaths. Now the Paráchas also are Mahomedan traders: and there is at least a very definite section of them with head-quarters at Mukhad on the Indus in Ráwalpindi who are a true caste, being converted Khatris, and marrying only among themselves. But unfortunately the word Parácha is also used in the central districts for any petty Mahomedan trader. The fact seems to be that in the Ráwalpindi and Pesháwar divisions, where Paráchas are a recognised and wealthy caste, Khojah is used for miscellaneous Mahomedan traders, chiefly hawkers and pedlars, or at least petty traders; while in the eastern districts and in the Deraját, where Khojahs are commercially important, Parácha is used for the Mahomedan pedlar. Thus in our tables the divisional offices have in many cases included Parácha under Khojah and Khojah under Parácha, and the figures cannot safely be taken separately.

These Mahomedan traders, whether called Khojah or Parácha, are found all along the northern portion of the Province under the hills from Amritsar to Pesháwar, and have spread southwards into the central and eastern districts of the Western Plains, but have not entered the Deraját or Muzaffargarh in any numbers; though to the figures of Abstract No. 91 must be added those of Abstract No. 72 (page 224) for these last districts. Their eastern boundary is the Satluj valley, their western the Jahlam-Chanáb, and they are found throughout the whole of the Salt-range Tract. Probably it is hardly correct to say of them that they have "spread" or "entered;" for they apparently include many distinct classes who will have sprung from different centres of conversion. They appear to be most numerous in Lahore. A very interesting account of a recent development of trade by the Khojahs of Gújrát and Siálkot is given in Panjáb Government Home Proceedings No. 10 of March 1879. It appears that these men buy cotton piece-goods in Dehli and hawk them about the villages of their own districts, selling on credit till harvest time; and the business has now assumed very large proportions. The Khojahs of the Jhang district are thus described by Mr. Monckton: "They do not cultivate with their own hands, but own a great many wells and carry "on trade to a considerable extent. They are supposed to have been converted from Hinduism. They "do not practise cattle-stealing, but are a litigious race, and addicted to fraud and forgery in the prose-"cution of their claims."

The Paráchas of the Salt-range Tract require a word of separate notice. Their head-quarters are at Mukhad in Pindi, and there are also large colonies at Attak and Pesháwar, whence they carry on an extensive trade with the cities of Central Asia, chiefly in cloth, silk, indigo, and tea. They say that their place of origin is the village of Dangot in the Bannu district, and that they moved to Mukhad in Sháhjahán's time; but another account is that they were Khatris of Lahore, deported by Zamán Sháh. They have seven clans and give their daughters only to Paráchas, though they will occasionally take wives of foreign origin. They still retain the Hindu title of Rája. They will not marry with Khojahs, and have dropped the Hindu ceremonial at their weddings, which they say the Khojahs of those parts still retain. They account for their name by deriving it from *párcha* "cloth," one of the principal staples of their trade. Some of the Paráchas of Ambála seem to have returned themselves as Parácha Khel, and to have been not unnaturally classed as Pathán by the tabulators. I cannot give separate figures for these.

[1] The Khojahs of Bombay are well known for their wealth and commercial enterprise.

Part V.—Religious, Professional, Mercantile, and Miscellaneous Castes.

CARRIER AND PEDLAR CASTES.

546. Carriers, Cattle-merchants, Pedlars, &c.—I have said that the commerce of the Panjáb was in the hands of the group just discussed, with the exception of the trade in meat, liquor, and vegetables, the traffic in cattle, the carrying trade, and petty pedling and hawking. The sellers of meat and liquor will be discussed under the head of miscellaneous artisans; and the group which I am now about to describe consists of the traders in cattle, the carriers, and the pedlars and hucksters of the Province. I have divided it into three sections, though I shall presently show that the first two overlap considerably, and that the third is incomplete. The first section includes the Banjáras, the Labánas, the Rahbáris, and the Untwáls; and these castes include most of the professional carriers and cattle-dealers, and some of the pedlars of the Panjáb. The second class consists of the Maniárs, the Bhátras, and the Kangars, and includes the rest of the pedlars of the Province save only such as belong to the Khojah and Parácha castes just discussed. The third class includes the Kunjras and the Tambolis, both Greengrocers.

But it must be understood that, though there are no castes in the Panjáb besides those above mentioned whose hereditary occupation it is to trade in cattle and carry merchandise, yet an immense deal of traffic in cattle goes on quietly among the villagers without the intervention of any outsider; while in the early months of the hot weather, when the spring harvest has been cut, and before the early rains of autumn have softened the ground sufficiently for ploughing to be possible, the plough oxen of the unirrigated Eastern Plains find employment in carrying the produce of their villages to the line of rail or to the great city marts, and in bringing back salt and other products not indigenous to the tract.

547. The Banjara (Caste No. 94).—This and the following or Labána caste are generally said to be identical, being called Banjára in the eastern districts and Labána in the whole of the Panjáb proper. But Banjára, derived from *banij* "a trader" or perhaps from *banji* "a pedlar's pack," is used in the west of the Panjáb as a generic term for "pedlar," and I have therefore kept the figures distinct. Indeed it is to be feared that in that part of the Province many persons have been shown as Banjára in consequence of their occupation only.

The Banjáras of the eastern districts are a well-marked class, of whom a long and very complete description will be found in Elliott's *Races of the N. W. P.*, Vol. I, pages 52-56. They are the great travelling traders and carriers of Central India, the Deccan and Rájpútána; and under the Afghán and Mughal Empires were the commissariat of the imperial forces. There is a simile applied to a dying person; "The Ban-"jára goes into the jungle with his stick in his hand. He is ready for the journey, and there is nobody "with him." From Sir H. Elliott's description they seem to be a very composite class, including sections of various origin. But the original Banjára caste is said to have its habitat in the sub-montane tract from Gorakhpur to Hardwár The Banjáras of the North-West Provinces come annually into the Jamna districts and Eastern States in the cold weather with letters of credit on the local merchants, and buy up large numbers of cattle which they take back again for sale as the summer approaches; and it is principally these men and the Banjára carriers from Rájpútána to whom our figures for Hindu Banjáras refer. The Musalmán Banjáras are probably almost all pedlars. The headmen of the Banjára parties are called *Náik* (Sanskrit Náyaka "chief") and Banjáras in general are not uncommonly known by this name. The Railway is fast destroying the carrying trade of these people except in the mountain tracts. The word Banjára is apparently sometimes used for an oculist, so at least Mr. Baden-Powell states. (See further under Mahtam, section 495 *supra*.)

548. The Labana (Caste No. 52).—These men are generally associated with the caste just discussed. With the exception of Muzaffargarh and Bahawalpur, which will be discussed presently, they are almost wholly confined to the hill and sub-montane districts. They are the carriers and hawkers of the hills, and are merely the Panjábi representatives of that class of Banjáras already alluded to who inhabit the sub-montane tracts east of the Ganges. The Labánas of Gújrát are thus described by Captain Mackenzie:—

"The Labanas are also a peculiar people. Their status amongst Sikhs is much the same as that of the Mahtams. They cor-"respond to the Banjaras of Hindustan, carrying on an extensive trade by means of large herds of laden bullocks. Latterly they "have taken to agriculture, but as an additional means of livelihood, not as a substitute for trade. As a section of the community "they deserve every consideration and encouragement. They are generally fine substantially built people. They also possess much "spirit. In anarchical times when the freaks or feuds of petty Governors would drive the Jats or Gujars to seek a temporary "abiding place away from their ancestral village, the Labanas would stand their ground, and perhaps improve the opportunity "by extending their grasp over the best lands in the village, in which their shorter-sighted and less provident lords of the Manor had, "in some former period, permitted them to take up their abode for purposes of commerce. Several cases of this nature came to light "during settlement, and in most of them the strength and spirit of progress were as apparent in the Labanas as were the oppo-"site qualities conspicuous in their Gujar opponents. Their principal village is Tanda (which means a large caravan of laden bullocks) "and is an instance of what I have above alluded to. Allowed to reside by the Gujar proprietors of Mota, they got possession of the "soil, built a kasba, and in every point of importance swamped the original proprietors. They have been recognized as proprietors, "but feudatory to their former landlords the Gujars of Mota, paying to them annually in recognition thereof, a sum equal to one-tenth "of the Government demand."

There is a curious colony of Labánas on the lower Indus who are said to have settled there under the Sikh rule, and who are almost all Munna Sikhs or followers of Bába Nának, though many of them are returned in the Bahawalpur tables as Hindus. These men have almost entirely given up traffic and trade, and settled on the banks of the river where they lead a sort of semi savage life, hunting and making ropes and grass mats for sale. They hardly cultivate at all. Their numbers are much under-stated in Abstract No. 94, as Abstract No. 72 (page 224) shows that 4,317 of the Bahawalpur Labánas were returned as Jats. The Labánas of Jhang are said to have come from Jaipur and Jodhpur, and to be the same as the Mahtams of Montgomery. On the whole the Labánas appear to be by origin closely allied with, if not actually belonging to, the vagrant and probably aboriginal tribes whom we shall discuss in the next part of this chapter; and it may be that at least some sections of the Labánas are of the same stock as they. (See further under Mahtam, section 495 *supra*.) About 30 per cent. of the Labánas are returned as Sikhs and almost all the rest as Hindus, there being only some 1,500 Musalmáns among them. Little is known of the sub-divisions of the caste. The largest seems to be the Ajráwat with 4,400 souls, chiefly in Gújrát and Lahore; the Dátla with 4,173 souls, chiefly in Lahore; the Maliána with 2,537 and the Bhagiána with 2,015 persons, both in the Amritsar and Lahore divisions; and the Gáhri with 1,925 persons along the whole foot of the hills. But the greater part of the caste have returned no large divisions.

Part VI.—The Vagrant, Menial, and Artisan Castes.

577. The Sansi (Caste No. 72).—The Sánsis are the vagrants of the centre of the Panjáb, as the Aheris are of its south-eastern portions. They are most numerous in the Lahore and Amritsar divisions, and are also found in considerable numbers in Lúdhiána, Karnál, and Gújrát. They trace their origin from Márwár and Ajmer where they are still very numerous. They are essentially a wandering tribe, seldom or never settling for long in any one place. They are great hunters, catching and eating all sorts of wild animals, both clean and unclean, and eating carrion. They keep sheep, goats, pigs, and donkeys, work in grass and straw and reeds, and beg; and their women very commonly dance and sing and prostitute themselves. They have some curious connection with the Jat tribes of the Central Panjáb, to most of whom they are the hereditary genealogists or bards; and even in Rájpútána they commonly call themselves *bhart* or "bards." They are said also to act as genealogists to the Dogars of Fírozpur, the Rájpúts of Hushyárpur and Jálandhar, and the Sodhis of Anandpur. About 11 per cent. are returned as Musalmáns and a very few as Sikhs. The rest are Hindus, but they are of course outcasts. A slight sketch of their religion is given in section 296. They trace their descent from one Sáns Mal of Bhartpur whom they still revere as their Guru, and are said to worship his patron saint under the name of Malang Sháh. Their marriage ceremony is peculiar, the bride being covered by a basket on which the bridegroom sits while the nuptial rites are being performed. They are divided into two great tribes, Kálka and Málka, which do not intermarry. They have a dialect peculiar to themselves; and their women are especially depraved.

The Sánsis are the most criminal class in the Panjáb; and it will be seen from Abstract No. 97 on the next page that they are registered under the Act in nine districts. Still though the whole caste is probably open to suspicion of petty pilfering, they are by no means always professional thieves. The Panjáb Government wrote in 1881: "Their habits vary greatly in different localities. A generation ago they "were not considered a criminal class at Lahore, where they kept up the genealogies of the Jat land-"holders and worked as agricultural labourers. In Gurdáspur on the other hand they are notorious as "the worst of criminals." Where they are professional criminals they are determined and fearless, and commit burglary and highway robbery, though their gangs are seldom large. The thieving Sánsis are said to admit any caste to their fraternity on payment except Dhedhs and Mhangs; and the man so admitted becomes to all intents and purposes a Sánsi.

578. The Pakhiwara (Caste No. 117).—The Pakhíwáras are often said to be a branch of the Sánsis, whom they resemble in many respects; but this is more than doubtful. They take their name from the word *pakhi*, which means a "bird," and also a "straw hut," either meaning being appropriate, as the Pakhíwáras live in straw huts and are hunters and fowlers. They are found chiefly in the Amritsar division, Gújrát, and Multán, but especially in Siálkot. They are all Musalmán, but eat vermin and are therefore outcasts[1]. They are by hereditary occupation fowlers and hunters; but they seem to have taken very generally to hawking vegetables about for sale, and in some parts the word Pakhíwára is almost synonymous with *kunjra* or "greengrocer." They are a very criminal tribe, and in Siálkot they are (see Abstract No. 97) registered as such and have been settled by Government in small villages and given land to cultivate. Excepting the persons so settled, the Pakhíwáras are essentially vagrant in their habits.

579. The Jhabel (Caste No. 107).—The Jhabel, or as he is often called Chabel, is said to take his name from *chamb*, the Panjábi for a *jhíl* or marsh[2]. Mr. O'Brien describes the Jhabel in his *Glossary* as "a tribe of fishermen who came originally from Sindh, and still speak pure Sindhi among themselves; "and who are addressed by the title of *Ját*, which is Sindhi for 'Prince.' They are Musalmáns and are "considered orthodox, because they do not, like the Kehals and other fishing tribes, eat turtles and croco-"diles[1]." This refers to the neighbourhood of Multán, where they are a purely fishing and hunting caste of vagrant habits, living on the banks of the river. But they have spread up the Satluj as high as Fírozpur and Lahore, and on the upper parts of the river work chiefly as boatmen, though they still fish and are great hunters. In fact Mr. Wilson says that all the Sirsa Malláhs or boatmen are Jhabels, and it is very probable that many Jhabels have in that district, and perhaps elsewhere, returned themselves as Malláh.

There are small colonies of Jhabels in Hushyárpur, Gurdáspur, and Kapúrthala, who are hunters and fishermen, divers and well-sinkers, and sometimes own a little land. They look upon the calling of boatman as degrading, and will not intermarry with the Jhabels of the Satluj. In Gurdáspur the word is said to include men of any caste who make their living from the fens or swamps; but I doubt the accuracy of this statement. (See also next paragraph under Kehal.)

580. The Kehal or Mor (Caste No. 161).—The Kehals or Mors, for the two appear to be identical and I have joined the figures together, are a vagrant fishing tribe found on the banks of the lower Satluj, Chanáb, and Indus. Mr. O'Brien writes of them in his *Glossary*:—

"They profess Mahomedanism, but eat alligators, turtles and tortoises, which they justify by a text of Imám Sháfi[1]. They "derive their name from *kehara*, Sindhi for lion; but perhaps the Sanskrit *kewada* or 'fisherman' is a more probable derivation."

And in his Settlement Report he writes:—

"The Kehals and Mors are said to be one tribe. In the north of the district they are called Mors, eat crocodiles and "tortoises, and no Mahomedan will associate with them. In the south they do not eat these animals, and are considered good "Mahomedans. The Kehals and Mors live by fishing, but some of them, as well as of the Jhabels, have taken to agriculture, and "are fond of cultivating *samúka*, a grain that is sown in the mud left by the retreating river. These tribes live separately in "villages near the river called Miáni, from *me*, a 'fisherman.' There is an old report in the Deputy Commissioner's office, "which says that these three tribes were cannibals; but modern observation does not confirm this."

The Kehals also catch and eat lizards. It is said that a crocodile can smell a Mor from a long distance.

[1] Mr. Christie says that, of the four great Sunni schools (see section 283), the Hambali are most restricted as to what is lawful to eat, the Hanifi rules follow very closely the Mosaic customs, the Sháfai tench that all animals which inhabit the water are clean, while the Máliki pronounces everything pure, whether on earth or in the water, and excludes only such animals as have been specially declared unclean, as the dog, the pig, and birds that use their talons when feeding. He tells me that all Pakhíwáras belong to the Máliki, and all Jhabels and Malláhs to the Sháfai school.

[2] Another derivation is from *jham*, the dredger used in sinking wells.

Part VI.—The Vagrant, Menial, and Artisan Castes.

and will flee at his approach; and some officers who have come into contact with the tribe tell me that they are inclined to believe the statement, for that they would do the same. Of the 1,251 Kehals entered in the tables, 390 returned themselves as Mor and 861 as Kehal.

581. The Gagra (Caste No. 133).—Gágra is a small caste, for the most part Musalmán and chiefly found in the central districts, who wander about catching and eating vermin. But their hereditary occupation is that of catching, keeping, and applying leeches; and they are often called Jukera, from *jonk*, a "leech." They also make matting and generally work in grass and straw, and in some parts the coarse sacking used for bags for pack animals and similar purposes is said to be made almost entirely by them. The Musalmán Gágras marry by *nikáh*. They seem to fulfil some sort of functions at weddings, and are said to receive fees on those occasions. It is said that they worship Bála Sháh, the Chúhra *Guru*.

582. The Mina (Caste No. 166).—The Mína is, in the Panjáb at least, almost invariably criminal. In Alwar and Jaipur however, which are his home, this does not appear to be the case. Indeed the Jaipur State is said to be "really made up of petty Mína States, now under the chieftaincy of the Kachwáha Rájpúts." In Gurgáon indeed he cultivates land, but this does not prevent his being a professional thief. I extract the following description of the caste from Major Powlett's Gazetteer of Alwar:—

"Minas were formerly the rulers of much of the country now held by the Jaipur Chief. They still hold a good social "position, for Rajputs will eat and drink from their hands, and they are the most trusted guards in the Jaipur State. The "Minas are of two classes, the 'Zamindari,' or agricultural, and the 'Chaukidari,' or watchmen. The former are excellent "cultivators, and are good, well-behaved people. They form a large portion of the population in Karauli, and are numerous "in Jaipur.

"The 'Chaukidari' Minas, though of the same tribe as the other class, are distinct from it. They consider themselves "soldiers by profession, and so somewhat superior to their agricultural brethren, from whom they take, but do not give, "girls in marriage. Many of the 'Chaukidari' Minas take to agriculture, and, I believe, thereby lose caste to some extent. "These Chaukidari Minas are the famous marauders. They travel in bands, headed by a chosen leader, as far south as "Haidarabad in the Deccan, where they commit daring robberies; and they are the principal class which the Thaggi and "Dacoiti Suppression Department has to act against. In their own villages they are often charitable; and as successful plun-"der has made some rich, they benefit greatly the poor of their neighbourhood, and are consequently popular. But those who "have not the enterprise for distant expeditions, but steal and rob near their own homes, are numerous and are felt to be a great "pest. Some villages pay them highly as Chaukidars to refrain from plundering and to protect the village from others. So "notorious are they as robbers that the late Chief of Alwar, Banni Singh, was afraid lest they should corrupt their agricultural "brethren, and desirous of keeping them apart forbade their marrying, or even smoking or associating with members of the "well-conducted class.

"In April 1863, Major Impey, then Political Agent of Alwar, issued orders placing the Chaukidari Minas under sur-"veillance; and under Major Cadell's direction lists of them have been made out, periodical roll-call enforced in the villages "and absence without leave certificate punished.

"I am not sure that, although speaking generally Minas are divided into Chaukidari and Zamindari, there is any hard and "fast line between the two classes. There is, I believe, an intermediate class, for Maharaja Banni Singh's attempts to keep the two "apart were not very successful.

"There are said to be 32 clans of Minas. Out of 59 Minas apprehended for dacoity by the Dacoity Suppression Department, "I found that the Jeb clan furnished 17, the Kagot 9, the Sira 8, and the Jarwál and Bágri 5 each. The Susáwat was, I believe, "formerly the most powerful clan, and that which held Ajmere."

The Mínas are the boldest of our criminal classes. Their head-quarters, so far as the Panjáb is concerned, are the village of Sháhjahánpur, attached to the Gurgáon district but surrounded on all sides by Rájpútána territory. There they till lately defied our police, and even resisted them with armed force. Their enterprises are on a large scale, and they are always prepared to use violence if necessary. In Márwár they are armed with small bows, which do considerable execution. They travel great distances in gangs of from 12 to 20 men, practising robbery and dacoity even as far as the Deccan. The gangs usually start off immediately after the Díwáli feast, and often remain absent the whole year. They have agents in all the large cities of Rájpútána and the Deccan who give them information, and they are in league with the carrying castes of Márwár. After a successful foray they offer one-tenth of the proceeds at the shrine of Káli Devi. The criminal Mínas are said to inhabit a tract of country about 65 miles long and 40 broad, stretching from Sháhpurah 40 miles north of Jaipur to Guráora in Gurgáon on the Rohtak border, the most noted villages being Koti Putli, Bhairor, and Sháhjahánpur, each of which contains some 500 robbers. Their claim to Rájpút descent is probably well founded, though they are said to spring from an illegitimate son of a Rájpút; and in woman's slang one woman is said to "give Mína" (*mina dena*) to another when she accuses her of illicit intercourse[1]. They practise *karewa* or widow-marriage. They have a dialect of their own; or rather perhaps, a set of slang words and phrases which are common to the criminal classes. In the Panjáb the Mína is almost confined to Gurgáon and the neighbouring portions of the Patiála and Nábha States. They are almost all Hindus and belong to the Chaukidári section and the Kagot clan (see further under Meo, section 478).

583. The Harni (Caste No. 159).—This again is one of the most criminal castes in the Province, and as will be seen from the figures of Abstract No. 97 on page 312, a greater number of them are registered under the Criminal Tribes Act than of any other caste except Sánsi. They are found in the districts lying under the hills from Lúdhiána to Siálkot, and also in Firozpur and Faridkot. They are said to have been Rájpúts driven from Bhatner by famine, who were employed by the Rai of Raikot in Lúdhiána for purposes of theft and to harass his enemies. They are also said to be Bhíls or Gonds and to have come from the Rájpútána desert. Their chief crimes are burglary and highway robbery, to effect which they travel in gangs, often under the disguise of carriers with pack-oxen. Their women also wander about as pedlars to pilfer and collect information. They are all returned as Musalmán.

584. The Bilochi (Caste No. 18).—The Biloch of the frontier has already been described at pages

[1] This is as I find the fact stated. But the word *mihna* or *mahna* seems to be commonly used in the same sense throughout the Panjáb; and it is very probable that the expression quoted has nothing to do with the name of the Mína caste.

Part VI.—The Vagrant, Menial, and Artisan Castes.

WATERMEN, BOATMEN, AND COOKS.

616. Watermen, boatmen, and cooks.—Abstract No. 101 below gives the figures for this great group, in which I have included the Jhínwar, the Máchhi, the Bhatyára, the Bharbhúnja, and the Malláh. It is generally believed that all these men are of the same caste, Kahár being their usual name in the North-West Provinces, Jhínwar in the east of the Panjáb where they are for the most part Hindu, and Máchhi in the west of the Province where they are mostly Musalmán. Being essentially fishermen and watermen, they are most numerous in proportion to total population in the western and central districts which are traversed by the great Panjáb rivers, where too they assist largely in agricultural labour, besides finding more extensive occupation as cooks among a Musalmán population with no prejudices against eating food prepared by others. On the frontier proper, like most of the occupational castes, they are few in number. In the Eastern Plains and hills these people are returned as Jhínwars; west of Lahore as Máchhis. They are one of the pleasantest and most willing of the menial classes, and the *Bhishti* is proverbially a good servant. Bhatyára, Bharbhúnja, and Malláh are names of occupations merely, but of occupations which are followed almost if not quite exclusively by the Jhínwar caste.

Part VI.—The Vagrant, Menial, and Artisan Castes.

617. The Jhinwar (Caste No. 15).—The Jhínwar, also called Kahár in the east, and Mahra[1], where a Hindu, in the centre of the Province, is the carrier, water-man, fisherman, and basket-maker of the east of the Panjáb. He carries palanquins and all such burdens as are borne by a yoke on the shoulders; and he specially is concerned with water, insomuch that the cultivation of water-nuts and the netting of water fowl are for the most part in his hands, and he is the well-sinker of the Province. He is a true village menial, receiving customary dues and performing customary service. In this capacity he supplies all the baskets needed by the cultivator, and brings water to the men in the fields at harvest time, to the houses where the women are secluded, and at weddings and other similar occasions. His occupations in the centre and west of the Province are described below under the head Máchhi. His social standing is in one respect high; for all will drink at his hands. But he is still a servant, though the highest of the class.

Division.	Saqqáh.	Máshki.

Pesháwar	...	194
States of East. Plains	5,303	...

I have included under Jhínwar such men as returned themselves as Bhishtis, Máshkis, or Saqqáhs, the terms for Musalmán water-carriers. It is just possible that some of these men may be of other castes than Jhínwar, but the number of such will be exceedingly small. The numbers so included are given in the margin, except for the Amritsar division which made no separate returns.

618. Divisions of Jhinwar, Machhi, and Mallah.—The sub-divisions of both Jhínwar and Máchhi are very numerous. I show one or two of the largest in the margin, adding the figures for Mallás. These tribes do not appear to be found in any numbers among the Bhatyára and Bharbhúnja, and we must wait for the detailed tables of clans before we can compare the sub-divisions of those castes, and thus throw light upon the question of their identity or diversity.

Division.	Divisions of the Jhinwar group.		
	Jhínwar.	Máchhi.	Mallah.
Khokhar	8,657	43,865	2,362
Mahár	27,337	115	...

Manhás	3,112	7,619	329
Tánk	8,587	2	13
Suhál	3,928	14	...

619. The Machhi and Men (Caste No. 28).—Máchhi is, as I have said, only the western name for the Musalmán Jhínwar. In the Amritsar division those returning themselves as Máchhi have been included under Jhínwar. In the Lahore and Ráwalpindi divisions both names are used; and in the western districts both, where used at all, are applied indifferently to the same person. But in parts of the Central Panjáb, where the eastern Hindu meets the western Musalmán, the two terms are generally used distinctively. The Máchhi occupies in the centre and west the same position which the Jhínwar fills in the east, save that he performs in the former parts of the Province a considerable part of the agricultural labour, while in the east he seldom actually works in the fields, or at least not as a part of his customary duties; though of course all classes work for pay at harvest time, when the rice is being planted out, and so forth. But besides the occupations already described for the Jhínwar[2], the Máchhi is the cook and midwife of the Panjáb proper. All the Dáyas and Dáyis, the accoucheur, midwife, and wetnurse class, are of the Jhínwar or Máchhi caste. So too the common oven which forms so important a feature in the village life of the Panjáb proper, and at which the peasantry have their bread baked in the hot weather, is almost always in the hands of a Máchhi for Musalmáns and a Jhínwar for Hindus. In some parts he is also the wood-cutter of the village. In the Deraját he is sometimes called Mánjhi or Manjhera, more particularly when following the occupation of a fisherman; and the name Men is often given him under the same circumstances in the rest of the Central and Western Panjáb, along the banks of our great rivers. Both these castes, where returned separately, have been classed as Máchhi, as have also the Sammi or fisherman and quail-catcher, and the Mahígír, Machhahra, Machhiyánia, or fisherman. The details are given below. Of the Mens in the Lahore division, 7,035 are in Lahore and 3,095 in Gújránwála, while of those of the Multán division all but 180 are in Montgomery. Thus the Mens seem almost confined to the middle Satluj. On the lower Indus, in Gújarát and lower Sindh, Máchhi seems to mean nothing more than fisherman. The figures of Abstract No. 72 (page 224) show that many of the Máchhis of the Deraját have returned themselves as Jats.

Sammi	...	...	...	168	...	...	...

620. The Bhatyara and Bharbhunja (Caste Nos. 92 and 108).—The Bhatyára is the baker and seller of ready-cooked food, who is to be found in all the caravanserais of our towns and encamping grounds. He is, I believe almost without exception, a Jhínwar by caste; and in many districts those who have returned themselves as Bhafyáras have been classed either as Jhínwar or as Máchhi, so that our figures do not

[1] Mahra seems to be a title of respect, just as a Bhishti is often addressed as Jamadár. *Mahár* is a synonym for "chief" in the south-west of the Province.

The carriage of burdens slung from a *bángi* or yoke seems to be almost unknown in the west of the Panjáb.

Part VI.—The Vagrant, Menial, and Artisan Castes.

completely represent the entries in the schedules. They are said to be divided in the North-West Provinces at any rate into two classes, Shershâhi and Salímshâhi, the women of the former wearing petticoats and of the latter drawers. They date the division from the time of Sultán Sher Sháh and his son Salím Sháh. Now that the railway has diminished their trade, the Bhatyáras are said to have taken to letting out *yekkas* and ponies for hire; and in the Deraját they are said to be the donkey-keepers of the district and to do petty carriage. This would connect them with the kiln rather than with the oven. In any case the name appears to be purely an occupational one, derived from *bhatti*, an oven or kiln; but like so many occupational guilds, the Bhatyáras appear in some parts to marry only among those following the same avocation[1]. The same may be said of the Bharbhúnja, who is as his name implies a grain parcher. He too is almost always a Jhínwar, but a small section of the Bharbhúnjas are Káyaths. He does not appear to occur as a separate class in the west of the Province, where probably the grain parching is done at the public oven of the Jhínwar or Máchhi. The Bharbhúnja is also occasionally called Bhojwa, and on the Indus Chatári.

621. The Mallah and Mohana (Caste No. 42).—The Malláh is the boatman of the Panjáb, and is naturally found in largest numbers in those districts which include the greatest length of navigable river. It appears from Abstract No. 72, (page 224,) that on the Indus he has often returned himself as Jat. He is, I believe, almost invariably a Jhínwar by caste, and very generally a Musalmán by religion; though Mr. Wilson believes that in Sirsa most of the Mallâhs on the Satluj are by caste Jhabel *q. v.* He generally combines with his special work of boat management some other of the ordinary occupations of his caste, such as fishing or growing water-nuts; but he is *not* a village menial.

Division.	Classed as Mallah.		
	Mohána.	Táru.	Dren.
Hushyarpur	...	...	69
Kangra	...	145	2,151
Hill States	...	5	73
Jahlam	979	...	...
Multan	4,750	...	...
Jhang	677	...	...
Muzaffargarh	6,641	...	...
Derah Ismail Khan	3,176	...	...
Derah Ghazi Khan	1,101	...	...
Bannu	1,375	...	...
Bahawálpur	9,180	...	...

Under the head Malláh have been included those returning themselves as Mohána, Táru, or Dren, the figures for which entries are given on the margin. In Lahore and Pesháwar no separate returns were made for Mohána. The Mohána is said to be the fisherman of Sindh; but in the Panjáb he is at least as much a boatman as a fisherman. The word in Sanskrit means an estuary or confluence of waters. The Dren and Táru are found in the hills only, where they carry travellers across the rapid mountain torrents on inflated hides. The former are said to be Musalmán and the latter Hindu. The word *dren* appears originally to mean the buffalo hide upon which the transit is made. In the Hill States 55 men returned as Daryái have also been included. Broadly speaking, it may perhaps be said that the Jhínwar and Máchhi follow their avocations on land and the Malláh and Mohána on water, all belonging to the same caste.

622. The Dhinwar of the Jamna.—Along the left bank of the Jamna below Dehli are settled a certain small number of people who call themselves Dhínwars. They work as fishermen and boatmen and some of them as Bharbhúnjas, and have returned themselves in the present Census, partly as Jhínwars, but mostly as Mallâhs. They appear to have moved up the river from the neighbourhood of Agra, and to keep themselves distinct from the indigenous Jhínwars. They are much addicted to thieving, and it has been proposed to treat them as a criminal tribe. Violent crime is however rare among them. They cultivate and even own a certain area of land. They generally travel about in the disguise of musicians, singing, begging, pilfering, and committing burglary and theft on a large scale when opportunity offers. They apparently extend all along the banks of the river in Alligarh, Bulandshahr, and other districts of the North-West Provinces. Men of this class seem to travel all over the Panjáb, as they have been convicted even in the frontier districts. All Hindus drink at their hands,—a sufficient proof that they are true Jhínwars by caste.

WORKERS IN WOOD, IRON, STONE, AND CLAY.

623. The workers in wood, iron, stone, and clay.—This group, of which the figures are given in Abstract No. 102 on the opposite page, completes, with the scavenger, leather-worker, and water-carrier classes, the castes from which village menials proper are drawn. It is divided into four sections, the workers in iron, in wood, in stone, and in clay. The workers in iron and wood are in many parts of India identical, the two occupations being followed by the same individuals. In most parts of the Panjáb they are sufficiently well distinguished so far as occupation goes, but there seems reason to believe that they really belong to one and the same caste, and that they very frequently intermarry. True workers in stone may be said hardly to exist in a Province where stone is so scarce; but I include among them the Ráj who is both a mason and a bricklayer and is said generally to be a Tarkhán by caste, and they are connected with the carpenters by the Thávi of the hills, who is both carpenter and stone-mason. The potters and brickmakers are a sufficiently distinct class, who are numerous in the Panjáb owing to the almost universal use of the Persian wheel with its numerous little earthen pots to raise water for purposes of irrigation.

[1] It is noticeable that all those returned as Bhatyára are Musalmán; probably because most Hindus, in the east of the Panjáb at least, will not eat bread made and cooked by a Jhínwar.

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Part I.—The Ages of the People.

already been noticed, but it is probably also due in part to the effects of the famine of 1858-60. With France any comparison is impossible, the extraordinary longevity and infecundity of the French people placing them at the very opposite pole to those of the Panjáb; and the population of Italy would appear to occupy a curiously intermediate position between those of France and England in the matter of distribution by age. The Greek people approach far more nearly than any other to those of the Panjáb, the figures following each other even in many of the abnormal variations. But even here we seem to have a slightly larger proportion of young and smaller of old people. Thus the characteristics of the Panjáb population as judged by European standards would appear to be, a large proportion of births and a high mortality. The further discussion of these points I shall reserve till I have examined the figures by locality and religion.

Abstract No. 109, *showing* Ages in Europe and the Panjab.

Passing over the first five years, which have already been discussed, we notice that children between 5 and 10 are more numerous in the central than in the eastern, and in the western than in the central divisions, the highest proportion being in the Deraját. Adding to these children under 5, the disproportion becomes so enormous that it renders it difficult to compare the remaining figures. When 31 per cent. are under 10 years of age in the Deraját and only 23 per cent. in the Dehli division, all the percentages for the remaining ages of the former division should have 12 per cent. added on to them before they can properly be compared with those of the latter. Notwithstanding this, the percentage of old people follows exactly the same order, being greatest in the western and smallest in the eastern divisions, and between the two in the central divisions. Both the oldest and the youngest following the same rule, it is not to be wondered at that in the intermediate figures the order is reversed by mere force of the properties of numbers. Yet a distinction is to be observed. From 15 to 25 or 30 the eastern divisions show the largest and the

Part I.—The Ages of the People.

western the smallest numbers, but after 25, and still more markedly after 30, the western divisions come first, notwithstanding the way they have to make up owing to their excessive number of children. The central divisions occupy an intermediate position almost throughout the table [1].

671. Turning to districts and taking the figures for ten-yearly periods, which I do not give in any table, as they can be worked out for the whole Province by one clerk in an hour by adding together pairs of columns from Supplementary Table M, we notice the very large numbers both of children under 10 and of old men over 50 in Hissár, Sirsa, and Lúdhiána among the eastern, and in Siálkot and Gújránwála among the central districts, and the large number of children in Fírozpur; while among the western districts the children and old men are in defect in Montgomery, still more in Muzaffargarh, and most of all in Multán. The manner in which the number of young children and old men vary together throughout both districts and divisions is *most* marked, and seems to show that the two are affected by similar climatic influences. The figures for Peshâwar, Ráwalpindi, Jahlam, and Derah Ismáil are distorted by the large number of immigrants of middle age; while no doubt a similar cause affects the figures for all the districts which contain large cantonments. Turning to the Native States we find the same broad features, though here the populations are often too small for the figures to be worth much. The number of children is greatest in Faridkot and Bahâwalpur, and extraordinarily small in the Hill States excepting the high mountain tracts of Chamba and Bashahr; while the proportion of old people is very high in the central States of the Eastern Plains and extraordinarily high in the Hills.

Summing up, we may say that in the great Western Plains the people are both more fecund and longer lived than in the eastern districts, and therefore must increase with far greater rapidity; while the central districts occupy an intermediate position. Of the western districts those which have the most plentiful canal irrigation are most unfavourable both to fecundity and to long life; while in the centre and east of the Panjáb the districts and states which consist of open unirrigated plains are most favourable to longevity, though they share with their neighbours that liability to periodical famine which is such an effective check upon increase of population. In the Hills the birth-rates seem exceedingly low except in the highest parts; but on the other hand the population is exceedingly long lived. These conclusions must be taken for what they are worth. The figures upon which they are based are known to be utterly inaccurate in detail. But the numbers dealt with are large, the results coincide with the known facts regarding increase of population, and above all the figures show a most extraordinary regularity when carefully examined. As they stand in the tables they seem a mass of irregularity. But if ten-yearly periods be taken instead of five-yearly, and the figures examined item by item as I have examined them, not only will it be found that the apparent discrepancies can almost always be accounted for, but that the figures present the same characteristics in districts in which the conditions of life are similar, and this to a degree which has surprised me. I sat down to the examination of the age statistics feeling that my time would be wasted. I rise from it with the highest respect for them. Of course they are inaccurate. So are the Census figures of all countries. In England they do not even publish in any detail the age figures as recorded, but doctor them, sometimes to the extent of five per cent., before using or printing them [2]. And our figures are infinitely more inaccurate than theirs. But, taken in large numbers, I believe that they are a very fair and useful approximation to the actual facts.

672. Age statistics for different religions.—The age statistics for the different religions will be found in Table VII. The results may be summarised thus :—

Abstract No. III, *showing* **Age Statistics** *for the* **Males** *of* **each Religion.**

	Religion.	0—	10—	20—	30—	40—	50—	60—	All ages.

	Musalmán	3,065	1,824	1,448	1,304	1,000	656	703	10,000

[1] I am sorry that I did not take as my illustrative figures, the proportions that the percentages of the total population of each age which are included in any district, bear to the percentage of total population of all ages which is included in that district. Such figures would have given a far more useful representation of the age-distribution of the population; for though the proportions between the figures for different districts within the same age-period would remain the same as they are now, yet the figures for the several age-periods would not be, as they now are, additively dependent upon one another. Unfortunately the difficulty of comparison which the disproportion in the numbers of young children creates did not occur to me till I came to examine the figures; and it was then too late to prepare another set.

[2] See Census Report of England and Wales, 1871, Vol. IV, p. 46, and xi.

Part I.—The Ages of the People.

increasing or decreasing at the same rate, or are stationary, the numbers in each generation will bear a constant ratio to those in the one preceding; that is to say, the numbers at successive points on *a c* and *a′c′* respectively will increase or decrease in the same ratio. Thus the number of children enumerated, represented by *a b* and *a′ b′*, will bear the same proportion in both cases to the total number enumerated, represented by *a c* and *a′ c′*. If indeed the one population is increasing faster than the other, the proportion of children to adults will be larger in the former than in the latter, because the numbers in each of the generations included in *a b* will be more in excess of the numbers of each of the generations included in *b c*. So if the average life of the adult be shortened in the one case, while that of the child remains the same, the proportion of children will be increased, for the ratio of *a b* to *b c* will become larger; while if the average life of the child be reduced, the opposite result will follow. But the former of these last two relations depends upon the density of the horizontal lines, that is of the generations, at different points along any vertical line, that is at any moment of time; the latter, upon the ratio of M d to d N, that is of the life of the child to the life of the generation. Both therefore are governed wholly by the relation between the total population, the birth-rates, and the death-rates; and are entirely independent of the inclination of the stream of population to the vertical, that is to say, of the stage in the life of the mother, whether late or early, at which the children are born [1].

678. Causes of the high proportion of children to adults.—Thus the ratio of children to adults depends upon the rate of increase of population and upon the average life of the generation, infant mortality being constant. And the rate of increase depends upon the proportion of annual births to total population, infant death-rates being constant. Thus the ratio of children to adults depends upon—

(1) the number of children annually born in a given population;
(2) the rate of infant mortality;
(3) the average life of the generation.

In other words you can increase the proportion of children to total population in three ways, by producing children in greater numbers, by reducing infant mortality, or by killing off your adults at an earlier age. Now to which of these three conditions is the high proportion of children in the Panjáb due? There can be little doubt that the Panjáb population is less long lived than that of England [2]. It would indeed be strange if it were not so. The peasant of our villages leads a life of unceasing labour, even if that labour be not so severe as that of the English workman. He inhabits a mud hovel in the middle of a crowded village surrounded by festering dunghills and stagnant pools, the water of which latter is not seldom his only drink. His food is poor, and he has to make up by quantity what it lacks in quality. His life is monotonous almost beyond conception. He is born, sickens, and dies almost like a beast of the field, with only such rude care as his neighbour's ignorance can afford. Below him is the outcast, the conditions of whose existence have already been described. Above him is the sedentary merchant, or the too often profligate gentleman. The healthy life of the English middle classes is almost unrepresented in the Panjáb. Whether mortality among children bears a higher or a lower proportion to that among adults in the Panjáb than in England I cannot say; nor are there any statistics on the subject which can be accepted as trustworthy. The climate appears more favourable to infant life if properly cared for than that of England; but native children grow up in the kennel, and take their chance of life and death. I doubt whether the rates of infant mortality are not even higher in proportion to those of adult mortality in the Panjáb than in England. But as to one cause of the excessive proportion of children there can be no doubt whatever; and that is the large number of births. That this is not due to marriage taking place at an early period of life, supposing the number of children borne by each mother to be constant, I think I have already shown. Thus the only causes to which the excess of births can be due are, either greater average fecundity on the part of the individual wife, or a larger proportion of married women.

Primâ facie it would appear that the custom of early marriage must increase the number of children borne by each wife. I am informed on the best authority that the child-bearing period of female life is much the same in the Panjáb as in England, the difference in climate having far less effect than is commonly supposed. But of this potential period of child-bearing, only that portion is effective for the production of children which is passed in the married state. Thus of two women, one of whom marries at 20 and the other at 30 years of age, the former has ten years longer than the latter in which to produce offspring, and, *other things being equal*, should apparently give birth to a larger number of children. Let us now examine the facts. The children shown as under one year of age in our returns are 750,457: and though the birth-rate of 1880 was probably below the average, yet the numbers returned are in excess of the births by some 6 to 8 per cent. because of the interval between the preliminary record and the final Census, so that the numbers may be taken as a fair average. Now there are 2,903,003 married women between the ages of 20 and 40; so that we have 25·8 children born for every 100 married women between these two ages, while the corresponding figure for England is 35·87; and if we take lower ages the comparison will be still more unfavourable for the Panjáb. There can be little doubt that early marriage, by forcing the girl into premature puberty, or at least into child-bearing before she is fully developed, not only reduces the number of wives who survive to become mothers, but lessens their reproductive powers. For the Multán division, where early marriage is unknown, the number of children per 100 wives between 20 and 40 years old is 31·5; and though the difference is perhaps partly due to a more healthy climate, yet it

[1] The above argument is based upon the assumption that the date of marriage is constant in each of the two populations. It is evident from the figure that if, at the moment of time M, the custom changes from late to early marriage, the proportion of children to total population will continually increase during the interval of time M d, will reach its maximum at the moment of time *d*, and will then continually decrease again, till at the moment of time N, when the last of the late-marrying generations has entirely died out, it becomes the same as it was before the change.

[2] Colonel Minchin, as Commissioner of Hissár, quotes an instance of "an old man in Sirsa who died in 1881, and who had been kept prisoner for two years by George Thomas as a hostage in 1801. He was said to be 110 years old, and declared he was of mature age in the terrible famine of 1783. He showed me with great pride his third set of natural teeth, which were like those of a full-grown man of twenty-five."

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

is also I believe largely a result of marriage at a more reasonable age. We must look then to the proportion of married women to explain the large excess of children; and here we arrive at what is, to my mind, the great cause of the peculiarity under discussion, and that is the custom, not of *early* but of *universal* marriage. In England in 1871 there were 3,504,351 women between the ages of 20 and 40, of whom 1,423,360 or 41 per cent. were unmarried; while 48 per cent., of the women over 15 years old were unmarried. In the Panjáb the corresponding proportions are 11 and 26 per cent., widows being of course reckoned as unmarried in all cases. As it is, even with this universal marriage, the fecundity of each married woman is so small and the mortality so high that the population of the Panjáb scarcely increases faster than that of England; and were the same proportion of the women to remain unmarried here as there, it is probable that population would actually decrease.

679. Average life, rates of mortality, expectation, and probable age.—The average length of life, the rates of mortality at different periods of life, and the expectation of life at each age are all capable of being deduced from the figures of Table VII. But they are merely the arithmetical results of those figures, and put the facts which I have discussed in a new shape only, without adding aught to them. I have examined the rates of mortality and find that they suggest nothing new, merely confirming the remarks made in the preceding paragraphs. The average length and expectation of life I have not had calculated, as the process is laborious. The fact is that these statistics, though exceedingly valuable for actuarial purposes, are of little other use; and it would be absurd to attempt to base upon figures so irregular and abnormal as I have shown our age figures to be, any sort of actuarial calculations. Even in England these statistics are based upon the registration of births and deaths and not upon the Census statistics; indeed the Census figures for age as recorded are *corrected* by those statistics before they are published. The probable distribution of the population by age, however, would certainly have been useful, and would not have been difficult to arrive at; and if I could have met with a man able to plot curves accurately and neatly I should have undertaken the examination of the figures. But the time allowed is too short for me either to teach a man or to make the plots myself, and I leave the subject untouched. A set of the most probable age curves can easily be worked out in the Sanitary Commissioner's Office from the figures of Table VII; and I think that the examination of those figures which has been made in the present chapter may afford useful hints for their treatment.

PART II.—THE CIVIL CONDITION OF THE PEOPLE.

680. Introductory.—The statistics regarding civil condition will be found in Tables V and VI of Appendices A and B, the former giving total figures for town and village populations separately, while the latter shows the civil condition of the followers of each religion classed according to age. The statistics for civil condition are, I suspect, fairly accurate. So far as they depend upon age the actual figures necessarily share the inaccuracies and variations of the record of age which have already been discussed; but these can be to a great extent eliminated by considering the proportions of single, married, and widowed within each age period, and it is in this form only that I shall examine the figures. It is true that it is in many parts of the Province and among many sections of the community considered shameful to have a nubile daughter unmarried; but I suspect that this difficulty has been overcome by understating the age of girls in this position, a practice which we have already seen reason to believe is not uncommon, rather than by returning them falsely as married. I doubt much whether a native would consider it right to do this, though he would have no hesitation whatever in understating his daughter's age. But this is one of those questions of native feeling upon which the opinion of most Englishmen is worth so little. Before proceeding to the discussion of the actual figures I shall briefly sketch some of the principal conditions and customs which rule marriage relations in the Panjáb.

681. Marriage distinct from cohabitation.—The primary and most essential difference between marriage in the Panjáb and in England is, that in the latter the ceremony is always immediately followed by cohabitation, while throughout a large portion of the former consummation does not take place till some years after marriage. When the parties have arrived at puberty before the ceremony they usually proceed at once to consummation. But wherever infant marriage is the custom, the bride and bridegroom do not come together till a second ceremony called *mukláwa* has been performed, till when the bride lives as a virgin in her father's house. This second ceremony is separated from the actual wedding by an interval of 3, 5, 7, 9, or 11 years, and the girl's parents fix the time for it [1]. Thus it often happens that the earlier in life the marriage takes place, the later cohabitation begins. For instance, in the eastern districts Jats generally marry at from 5 to 7 years of age, and Rájpúts at 15 or 16, or even older; but the Rájpút couple begins at once to cohabit, whereas the parents of the Jat girl often find her so useful at home as she grows up that some pressure has to be put upon them to induce them to give her up to her husband, and the result is that for practical purposes she really begins married life later than the Rájpút bride. Even after the consummation or *mukláwa* the bride stays only a few weeks with her husband, after which she returns to her parents for six months or a year; and it is not till after that time that she goes to live permanently in her new home [2]. Thus the marriage ceremony, so far as regards its immediate effect upon the manner of life of the couple, is a very different thing in many parts of the Panjáb from what it is in Europe. Indeed it is in those parts, as Mr. Wilson points out, rather a ceremony of inviolable betrothal than an actual marriage in the sense in which we understand the term; and for all purposes of vital and most purposes of social statistics, the *mukláwa* and not the wedding is the really important point. Mr. Wilson suggests that girls might, at a future Census, be returned as married only if they have actually gone to live with their husbands; and if trustworthy statistics could be obtained I believe that the results would be more valuable than those for the actual ceremony of marriage. But I doubt whether an attempt to distinguish would not result in confusion, whereas it is easy to get accurate figures for married and unmarried. At the present Census the enumerators were specially warned to enter as married those whose wedding had taken place, whether or no they had gone to live with their husbands.

682. Restrictions upon intermarriage.—The restrictions upon intermarriage in the Panjáb are of three kinds, according as they are based upon a religious, a tribal, or a social sanction. The religious restrictions are comparatively lax. Among Hindus a man may not marry a woman of the same patronymic (*gotra*) as his father or mother, or who is descended from paternal ancestors within six degrees; while among Musalmáns only the sister, niece, and aunt are excluded in addition to those in the direct line of descent. In both cases foster-kinship is as great a bar as blood relationship. But throughout the whole of the eastern Panjáb, excepting perhaps the colonies of foreign Musalmáns such as Saiyads, Mughals, and the like who may have settled there, and the educated class of Mahomedan converts who are almost wholly confined to the towns, tribal restrictions of a far more rigorous nature have taken the place of these religious rules; and the great mass of Mahomedan converts, Gújars, Rájpúts, and the like, are as much bound by them as are their Hindu brethren. These tribal restrictions are based upon the two laws of exogamy and endogamy. The caste, or sometimes the section of the caste, is endogamous; that is to say a Jat must marry a Jat and a Gújar a Gújar, or a Sársút Bráhman must marry a Sársút and a Gaur Bráhman a Gaur. Secondly the tribe is exogamous; that is to say a Mán Jat must not marry a Mán Jat, but a Jat of some other tribe. But the restrictions go further than this. A man must not only not marry into his father's, that is to say his own tribe; but his mother's and his father's mother's tribe among most, and his mother's mother's also among some castes, are likewise forbidden to him. Moreover, as I have already stated in discussing migration (section 136), a man may not marry a woman of his own village or of any village which marches with it, and should as a rule take a wife from some little distance from his home. Moreover in the east of the Panjáb exchange of betrothal is thought disgraceful, and if desired is effected by a triangular exchange, A betrothing with B, B with C, and C with A. In

[1] Mr. Douie tells me that 11 months is also a permissible interval.

[2] I here describe the custom of the eastern districts, the only part of the Province of which I have any personal experience. But the custom is probably much the same throughout those parts of the Panjáb in which early marriage is the rule. Of course in the south-western districts, where both sexes marry as adults or almost so, cohabitation begins at once.

The number of wives to each husband is uniformly larger in the villages than in the towns. But this is not because polygamy is more common in villages than in towns; indeed the reverse is notoriously the case in parts where *karewa* is not customary, the richer classes of the cities marrying more than one wife far oftener than the poorer inhabitants of the villages. The reason of there being more wives in proportion to husbands in the villages than in the towns, is that many of the husbands are away from home on service or in trade in the cities and cantonments, leaving their wives in the villages. Thus in Hissár where there are no cantonments the inequality is much reduced, while in Pesháwar and Ráwalpindi where large cantonments, rapid growth of towns, and special demands for labour at the time of Census combined to attract a large immigrant population, the disproportion is at its highest. A portion of the inequality however is undoubtedly due to *karewa* in those parts where *karewa* is practised, for widow-marriage is allowed chiefly among the peasantry and not at all among the mercantile classes of the cities; and this is probably the cause of the excess in the Hissár division.

Taking villages and towns together, the high proportion of wives in the Jálandhar division is probably due to the emigration from Hushyárpur which has taken place of late years, and the polygamous habits of the hill people. In the Amritsar division it is again probably due to both polygamy in and emigration from Siálkot and Gurdáspur, as the proportion in the Amritsar district is very moderate. But, as in Hissár, it is probably caused in part by the large Jat population who universally practise *karewa*. Districts from which emigration is taking place naturally show more wives than husbands, as the men move first and send for their wives only when they have made for themselves a permanent home. On the other hand, districts like Sirsa which are being stocked by immigration show a large proportion of husbands, not only because the married male immigrants leave their wives behind them, but still more because their sons generally marry out of the district in the neighbourhood of their homes, and their wives are often absent at their parents' houses, especially in time of drought.

697. Turning to religion we find that polygamy is far more common among Musalmáns than among

Part II.—The Civil Condition of the People.

Hindus, except in the Jálandhar and Amritsar divisions which have already been discussed. The small proportion of wives among the Hindus of the Peshâwar division shows how largely the Hindu population consists of temporary immigrants. The proportion of wives to husbands among the Sikhs is curiously small. They are notoriously well off, they practise *karewa* more generally than do the members of any other religion, and I can only explain the figures by supposing that some of the Hindu women who have married Sikh husbands have been returned as Hindus. Yet this seems extremely unlikely, as all that a Hindu woman does on becoming a Sikh is to tie up her hair in a somewhat different fashion. If, as I myself believe and shall explain in the next paragraph, the Jats practise polyandry, this might perhaps account for the figures, as the great mass of the Sikhs are Jats. But even then all but the eldest brothers would probably return themselves as single. The large proportion of wives among the small Buddhist population is said to be due rather to the husbands being away on journeys or working elsewhere and leaving the aged females behind them, than to any general habit of polygamy. The small number of wives among Christians and Zoroastrians is of course owing to their sojourn here being only temporary.

The districts that show more married men than married women among the village population are Karnál, Sirsa, Ambála, Simla, Lahore, Multán, and Kohát; while in all these, and also in Dehli, Firozpur, Ráwalpindi, Derah Gházi Khán, and Peshâwar the number is larger among total population. In no case are the husbands in excess in the villages and not in the towns of any district.

On the whole polygamy is shown by the figures to be very rare. Indeed I am almost driven to suggest that widows who have been remarried by *karewa* must sometimes have been shown as widows, though it appears very unlikely that this should be so. It seems improbable that in the Hissár division for instance, only 3 out of every 100 married men should have taken a second wife if cases of *karewa* are included as well as those of polygamy proper. If, indeed, my belief in Jat polyandry is well founded, the smallness of the figures would be explained, for the younger brother would be nominally unmarried when the widow came to him. Or it may be that my suspicions expressed in section 689 are well founded, and that the figures are to be explained by the fact that very young girls who have not yet gone to live with their husbands have in some cases been returned as single, although the marriage ceremony has actually been performed. In the whole Province our figures show that there are 101 wives for every 100 husbands. But, as pointed out by Mr. Frizelle, this does not mean that so many as one in every 100 husbands take a second wife; for those who are well enough off to take a second often take a third and a fourth also, and thus the number of men who marry more than one wife is smaller than the excess of wives over husbands.

698. Polyandry.—Polyandry as an open and recognised institution is only found in parts of the Kúlu sub-division. The whole relations of the sexes in conjugal matters are so peculiar in that part of the country, and doubtless in the Hill States adjoining it, that I quote at length in the next paragraph Mr. Anderson's description of them. But polyandry proper is almost confined to Láhul and Seoráj, and in the latter the custom seems to be dying out. Mr. Lyall writes of it:—

"Polyandry in Seorâj is in reality a mere custom of community of wives among brothers who have a community of other "goods. In one house you may find three brothers with one wife, in the next three brothers with four wives, all alike in common; "in the next house there may be an only son with three wives to himself. It is a matter of means and of land; a large farm requires "several women to look after it. Where there is only one wife to several brothers, it will generally be found that some of the brothers "are absent for part of the year working as labourers. In Láhul polyandry, or the taking to wife of one woman by several brothers, "is a recognised institution, and is very general; the object is to prevent the division of estates. I remember a case which came before "me, in which one of two brothers living in polyandry much wished to separately marry a girl by whom he had had an illegitimate "child; but the wife objected strongly, claiming both brothers as husbands, and refusing to admit another woman into the household, "and she eventually prevailed.

"In Spiti polyandry is not recognised, as only the elder brother marries and the younger ones become monks; but there is "not the least aversion to the idea of two brothers cohabiting with the same woman, and I believe it often happens in an unrecog- "nised way, particularly among the landless classes who send no sons into the monasteries."

Now it is my own private opinion, and the opinion of several other officers who have mixed much with the people, that exactly what Mr. Lyall describes in the sentences quoted above prevails to a very considerable extent among the Jats of the Eastern Plains, or at least among those of the Jamna zone. A family of brothers lives in community of goods; the eldest alone marries a wife and all cohabit with her; the eldest dies, the next brother becomes the head of the house and the nominal husband; but throughout the woman lives with all the brothers as their wife. It may be, as Mr. Lyall says, that a solitary man may have two wives to himself, a pair of brothers a wife each, and a pair of brothers a wife between them; but where, as is not uncommonly the case among tribes in which the Levirate or primary form of *karewa* is the rule, the eldest only of two or more brothers living together is married, I believe that it is the rule and not the exception for the wife to cohabit with all the brothers. The practice is not openly recognised or admitted to the general public; but the suggestion of it is often denied with a laugh. Mr. Delmerick, who has great knowledge of native custom, writes:

"In the Ambála sub-montane tract from the Jamna to the Satluj polyandry is very extensively practised. Indeed a sister-in- "law is looked upon as common property, not only by uterine brothers, but by all *bhâis*, including first cousins. This is the case "among all castes of Hindus, including outcasts such as Chamárs. It is also a partially recognised custom among the Hindu Jats "and Gújars in the plains. Among them it is easier for a man to get a wife if he have brothers because she cannot then remain "a widow, and they say she then becomes a *sada sohágan*, a perpetually married woman."

I can give no proof of the prevalence of the custom; and though I have noticed several peculiarities in the Census figures which seem to support my contention, they are so slight that I base no argument upon them. But the question deserves further enquiry.

699. Relations between the sexes in Kulu and Lahul.—Mr. Anderson's description of the relations existing between the sexes in Kúlu and Láhul is as follows:—

"Polyandry is common among all classes in Seorâj except the Brâhmans of Nirmand; but people are ashamed of it and the "custom is disappearing. It exists also in part of Wazíri Rupi. The woman is considered the wife of the eldest brother and all "the children are considered his children. This was the rule recorded at settlement, but it is not now the recognised custom. In a "recent case, the evidence showed that the woman is allowed to state who the father is, and the succession is in accordance with her "allegations. She is careful to ascribe the paternity of a son to the bread earner of the family, or whoever happens to be the richest

Part I.—General and Comparative.

721. General distribution of male occupations.—Abstract No. 122 on the next page shows broadly the distribution of male occupations. I have in arranging these figures grouped together as far as was possible those occupations in the separation of which there was most fear of confusion; for instance I have included cooks (No. 55 of Tables XII A and B) with water-carriers (No. 58), since in the centre and west of the Panjáb, where alone the former were returned in any numbers, it was absolutely impossible to separate the two. The detailed remarks on each class which form Part II of the present chapter will show under what explanations and limitations each group of figures must be accepted. But on the whole the grouping of the Abstract may I think be taken as representing with considerable accuracy the general distribution by occupation of the male population of over 15 years of age, for it is to it alone that the figures refer. The doubts and uncertainties which attend the minute detail of occupations given in the final tables still affect in some degree the significance of the figures. But though they cannot be wholly removed, they do in a great measure disappear in the broader grouping here adopted. Some of them are got rid of by taking together occupations which the industrial practice of the country renders it impossible to separate effectually, while still more of them affect small figures only, and are quite unnoticeable when only main classes are considered. Thus our final tables show 44,963 silversmiths, 111 damasceners, and 70,741 blacksmiths. It is certain that the number of damasceners is understated. But it is equally certain that the whole number is so small, that whether the missing men have been returned as blacksmiths or silversmiths they have not appreciably affected the figures.

722. The figures of the Abstract do not include the whole of the male population of over 15 years of age. In the first place a certain proportion of this population had no occupations returned for them. The figures in the margin show that in British Territory no occupation was returned for about 5½ people in every hundred who are over 15 years of age. Now the instructions were to show occupations only for such males as were "of an age to do work," and as 14½ per cent. of the male population over 15 years of age are less than 20 years old, it may be concluded that the record of occupations is exceedingly complete so far as the total numbers are concerned. But besides this, the figures of the Abstract do not represent the whole numbers included in the final occupation tables, as nothing less than an entire regrouping of the whole 333 occupations would have secured this result. Thus I have only included the main groups in the figures now shown. But the numbers omitted are exceedingly small, never exceeding three per cent. in towns or one per cent. in villages, and only amounting on the whole to 11 per mille of urban, 7 per mille of rural, and 7 per mille of total population.

723. Government Servants.—The group that I have put first consists of all who are in Government employ, whether concerned in the administration of the country by the various civil departments and the municipal organisation, or in its defence by the military force. It corresponds with orders 1 and 2 of the final tables. Of the total numbers included, 48 per cent. are employed in the civil, 16 per cent. in the municipal and village, and 36 per cent. in the military administration. This group is naturally concentrated to a very large extent in the towns, and is most numerous at the capital of the Province, and where great cantonments exist. The very large numbers shown for the Ráwalpindi and frontier divisions are due not only to the normal concentration of troops on our frontier, but also to the extraordinary activity in the Commissariat and Public Works Departments which has already been alluded to as resulting from the Kábul campaign. The class of Government servants is in one respect that section of the community which is less than any other affected by distress and famine, for their employment is most permanent in its nature. On the other hand, their salaries being practically fixed, they feel a rise in prices more severely than the numerous classes who are either paid in kind, or receive a remuneration which fluctuates with the cost of living.

724. Classification of Government Servants.—The classification of persons in Government employ is one of the most difficult questions connected with statistics of occupations in the Panjáb, and, as will be shown in Part II of this chapter, the figures are exceedingly unsatisfactory. The functions assumed by Indian Governments are so diverse, and many of them are so different in their nature from those to which the English Government confines itself, being connected with the development rather than with the administration or defence of the country, that the same system of classification is not equally suitable to both countries. Should for instance menials, messengers, and artificers employed in the public offices be classed as Government servants? If so, should labourers employed in the excavation of a canal or the construction of a railway be so classed? If the answer be that the former are permanently and the latter temporarily employed, how is the line to be drawn in the numerous cases where a permanent subordinate establishment is temporarily augmented at certain seasons of the year? The primary object of the occupation tables appears to be to inform us by what calling each person earns his living, and not from what source he receives the wages of that calling; and I would class all scavengers, porters, blacksmiths, and other artisans and menials under their proper heads, irrespectively of the question whether they were working for a Government department or for private employers. So I would not distinguish between schoolmasters employed by the Educational Department and private schoolmasters, and I would take engineers together whether they were the servants of a Company or of Government. The Government can at any moment obtain full details of its own staff which will be far more accurate and complete than any that a Census can afford. I would class under Government service only such persons as are actually employed in the general or local administration, in the assessment and collection of revenue, in the adjudication of disputes, or in the detection, prevention, and punishment of crime, or who were attached to the regular forces and under military discipline. Even then many doubtful cases would arise and would have to be dealt with separately. For instance, a canal officer is often a revenue collector and a magistrate as much as an engineer. At any rate some definite system should be decided upon before next Census. Owing to the adoption of the English system in the present Census, we have even in the Imperial tables the telegraph signallers of the Panjáb Northern State Railway classed as "Civil Service" under the head "National Government," while those of the Sindh, Panjáb and Dehli Railway are shown under the sub-order "Messengers and Porters;" Government hospital assistants are grouped with "National Government," while Government compounders are shown under "physicians, surgeons, and druggists," and so forth; while in the Provincial tables the classification is even more unsatisfactory, because more uncertain.

Part I.—General and Comparative.

725. The agricultural and pastoral group.—The great group which follows next in the Abstract, corresponds with sub-order 1, order 8 of the final tables, comprises all the agricultural and most of the pastoral sections of the community, and constitutes no less than 60 per cent. of the rural and 54 per cent. of the total population. I shall leave the figures for those who combine agriculture with other occupations to be discussed presently, and confine myself for the moment to the agriculturists proper. The exceedingly small proportion which the agricultural bears to the total community in towns as compared with villages was of course to be expected; and that proportion is smallest where the presence of great cities and cantonments has collected the military, mercantile, and industrial classes in largest numbers. The figures in the margin, which are arranged in order, show very clearly the influence of these conditions. Among the rural population also the same influence is not wholly absent, for the proportion of purely agricultural population is smallest in those parts of the Province where wealth is greatest and commerce most active, and greatest in the more backward and less highly developed parts. But, as I shall presently explain, the figures do not by any means include all who are engaged in agriculture; and a part at least of the difference shown by the present figures between the central and eastern divisions and the frontier districts is due to the fact that the village menial class is more numerous in the former than in the latter.

AGRICULTURAL AND PASTORAL PER MILLE OF TOTAL SPECIFIED OCCUPATIONS.

Towns.		Villages.	
Hissar division	297	Native States	674
Native States	222	Hissar division	668
Jalandhar division	221	Peshawar division	637
Rawalpindi division	157	Derajat ,,	624

Multan ,,	112	Multan ,,	541
Dehli ,,	111	Lahore ,,	528
Amritsar ,,	104	Amritsar ,,	524

There is another consideration which affects in some degree the accuracy of the figures. I shall presently explain that the number of persons who combine agriculture with other occupations has almost certainly been understated, and it is exceedingly probable that in such cases, at any rate where the second occupation is of a menial nature, it has been dropped and only the agricultural occupation returned. Indeed even a shop-keeper who owned land would be under a temptation to return himself simply as "land-owner," for his own greater glorification. How far this has been the case in each part of the Province, and how often the menial cultivator has returned himself as a menial and how often as a cultivator simply, it is impossible to say. On the whole the figures are too large to be very materially affected by this cause.

726. Land-owners.—Abstract No. 123 in the margin shows the composition of the agricultural and pastoral class, the total of agriculturists proper being taken in each case as 100. I have attempted to divide cultivators into four classes, but it is very doubtful how far the attempt has been successful. First come those who own the land, whether they themselves cultivate it or not. I have just noticed that it is very probable that many people who own land, but whose principal source of income is some occupation other than agricultural, may have returned themselves simply as land-owners. But another difficulty was very generally felt in filling up the entries for land-owners. The sons of a land-owner who live with him and assist in the cultivation of his fields are strictly speaking not themselves proprietors, as they have no actual property in the land so long as their father lives. I think that the proper course obviously is to follow the *status* and to record such people as land-owners, and I believe that this course was as a rule adopted. But in some cases they may have been entered as tenants. I have said that the figures for land-owners include such proprietors as do not cultivate themselves, but let their land to tenants or employ hired servants. I think it is a pity that such people were not distinguished from cultivating proprietors; but it is now impossible to separate the figures. The Deputy Commissioner of Bannu estimates that ten per cent. of the land-owners do not cultivate; in Hushyárpur the estimate is five per cent. I should say that in the Eastern Plains one per cent. would be a high estimate; but in the hills where agriculture is looked upon as derogatory, and in the Western Plains where the dominant tribes prefer pastoral to agricultural pursuits, the proportion would almost certainly be larger.

727. Tenants.—Under the heading "tenants" are included all who take land of a landlord and cultivate it on their own responsibility. In the towns the tenant class is often of an exceedingly fluctuating nature, a man seldom holding the same plot for more than two or three years in succession; and much of the richer lands near the villages in the highly-

Part I.—General and Comparative.

cultivated central districts is held on a similar tenure, especially where the owners do not cultivate themselves. In the south-west of the Panjáb the tenant is not unfrequently little better than a serf, possessing neither capital nor appliances of his own, and cultivating with his landlord's oxen. But though the number of tenants who have no certainty of tenure, whether dependent upon law or upon custom, is considerable in itself, it forms but a small fraction of the class as a whole. The great mass of the tenants are, in perhaps most parts of the Panjáb, almost as fixed in their holdings for all practical and immediate purposes as are the landlords themselves, ejections being exceedingly rare in proportion to the numbers concerned; while where the tenant is constantly changing the fact is more often due to a competition for labour than to a scarcity of land, and the tenant abandons his holding, not because the landlord turns him out, but because he thinks he can obtain better terms elsewhere. Thus so far as the œconomical distribution of the population is concerned, the landlords and tenants may almost be taken together, both being dependent almost wholly upon the nature of the season and the produce of the land, and being little liable to distress save when these fail them. On the other hand the landlords are, taken as a whole, by far the wealthier of the two classes, their holdings and their capital are alike larger than those of the tenantry, their income is, in those parts of the Panjáb where true rent exists, supplemented by the rent paid by the latter, and the margin over and above the bare means of subsistence upon which they can fall back when distress does arise is larger. And this difference is greatest where the proportion of landlords to tenants is smallest; in the Jamna districts, where land-owners ordinarily cultivate themselves, there is often but little to choose between a tenant and a landlord in point of security of the means of living. It is noticeable how much more generally the landlords in the towns employ tenants to cultivate their land for them than do those of the villages. They are often wealthier, while many of them are more or less educated and follow other occupations under which they are returned. The figures in the margin show the divisions arranged in order according as the cultivation is chiefly in the hands of owners or of tenants[1]. In the eastern and central portions of the Panjáb and under the hills, where a numerous agricultural population cultivate with their own hands the land which often barely suffices for their numbers, the tenant class is comparatively small. But throughout the great plains of the west and in the newly settled districts of Hissár and Sirsa, where land is abundant and much of it is in the hands of small capitalists who have received grants of land and collected cultivators from all quarters to assist them in breaking it up, and again in the frontier districts where dominant tribes enjoy proprietary rights in land which is largely cultivated by an inferior population, the tenant class is exceedingly numerous in proportion to the proprietary body.

728. Agricultural labourers.—The next two groups are headed "joint cultivators" and "agricultural labourers." Here I have endeavoured to separate two very distinct classes. The first, known as *Sájji*, *Adhjogia*, or by corresponding terms, is associated with himself by the owner or tenant in the cultivation of his land, and receives a fixed share of the produce be it great or small. The nature of the association has already been described in section 108 of Chapter II. The second class consists of the agricultural labourers on fixed pay, whether by the day, month, or year. The type of the class is the *Kamera*, *Kúma*, or *Háli*. But I fear that the two classes have not been carefully distinguished in the schedule entries, and that a large number of each must have been included in the figures for tenants. According to the figures the joint cultivators are less numerous in towns than in villages, and are most common in the east of the Province; and this I believe to be in accordance with facts. So too the agricultural labourer is rightly shown as much more common in the towns than in the villages; but I believe that the figures under this heading are much too small for the Western Panjáb. According to the Abstract the class is hardly known in the Multán and Deraját divisions. Both these classes occupy an œconomical position greatly inferior to that of the tenant; but of the two the joint cultivator has far the more certain means of subsistence. He is, it is true, no less dependent upon the yield of the harvest than is the owner or tenant himself. But the partnership is in many cases one of long standing, and cannot at any rate be broken for a year, while the hopes of the harvest are wholly in the future when the agreement is concluded. The agricultural labourer on the other hand is at the best only paid by the year, and is often not entertained till the season has in some measure declared itself; while a large proportion of the class are mere temporary servants taken on for a short time only when the crops need watching, at harvest, and so forth, and a failure of rain deprives them of all hopes of employment. They are almost always paid in kind, and are so far independent of a rise in prices.

729. The pastoral class.—The figures for the grazier class are necessarily very imperfect. I have, as pointed out in Part II of this chapter, endeavoured in my final tables to separate the cattle-owners proper, that is those persons who derive their income from the possession of flocks and herds, from those who merely tend cattle. But it is impossible to separate with any completeness the one class from the other or either from the agriculturists. Every land-owner owns cattle, and as a rule his son tends them. Almost every cattle-owner holds land, and as a rule he and his son cultivate it. Still the number of persons returned as owning or tending cattle in the various parts of the Province, though incompletely representing the actual numbers engaged in the occupation, probably gives us a fair idea of the relative degrees in which pastoral are combined with agricultural pursuits. The number is far highest in the great pasture lands of the Western Plains, while in those alone are people returned as camel and cattle-owners, to the number of 9,000 in the Multán division and of 1,500 in the Deraját. The detailed figures of the tables

[1] The figures are of course based upon the *numbers* of owners and tenants as shown in the occupation tables, and not upon the *areas* cultivated by the two classes respectively.

Part I.—General and Comparative.

Taken as a whole this group is a poor one. It is composed almost entirely of artisans proper who are paid by the piece or by the day, the only exception being the drapers, and the washermen who are in villages often paid a fixed share of the produce. The weavers of the towns are notoriously poor in the extreme; and they are probably no better off in the villages, for one of the first things in which a peasant economises is his clothing.

736. The workers and dealers in food.—The group which follows next in the Abstract is exceedingly artificial, and, excepting the oilmen who can hardly be separated from the butchers on the one hand or from the cotton-cleaners on the other, is almost confined to towns. The figures are examined in detail in the second part of the chapter. The group is most abundantly represented in those parts where the cities are largest and the wealthy classes most numerous. The group as a whole is concerned with the luxuries of the rich rather than, like that which preceded it, with the simple wants of the village population; and though the city weavers are largely employed in producing costly fabrics, yet they are generally in the hands of large employers for whom they work at rates kept by competition at the lowest possible level, while the members of the group under consideration work and trade on their own account. The milk-sellers and probably the grêengrocers are often poor; but the group as a whole is mercantile almost as much as industrial, and would probably be one of the last to feel distress in times of trouble.

737. Miscellaneous industries.—The next group of the Abstract includes all the remaining industrial classes. The goldsmiths are, in the villages at least, almost as much pawn-brokers and money-lenders as they are artisans, while the other classes are chiefly found in the towns. The brassmakers are markedly most numerous in the Dehli division, where the manufacture of metal vessels thrives in Dehli, Rewári, Pánipat, and several other towns. The detailed figures are discussed in Part II of the chapter. Like the preceding one this group is chiefly occupied in ministering to the wants of the well-to-do classes, and is probably on the whole fairly well off, or at least less liable to suffer from distress and hard times than many other more important sections of the community.

738. Total industrial class.—The proportion to total population borne by the industrial classes in the various divisions is shown in the margin.

The effect of the great industrial centres at Amritsar, Dehli, and Multán is very marked; while the small proportion which the industrial classes bear to the urban population of the western and Hissár divisions and of the Native States, is naturally to be expected in those parts of the Panjáb where the population is most primitive. Turning to the village population, the three divisions of Hissár, Pesháwar, and the Deraját stand at the bottom of the list together with the Native States; and the reasons have already been noticed in section 733. On the other hand those divisions stand highest where agricultural practice has reached its highest development, where the wealth and commerce of the Province are chiefly concentrated, and where the most highly organised society is to be found.

739. The labouring class.—The class of labourers which stands next in the Abstract is the one of all others which feels most quickly and most severely the approach of a season of distress. It is probable, as explained in the second part of the chapter, that a part at least of the coolie class, so far as it is returned from the villages, consists of village menials. But the general labourers of the towns, and a portion, probably considerable, of those returned from villages, live from hand to mouth, picking up almost from day to day such employment as they can procure, and seldom certain of work for the morrow. These are the people who crowd our poorhouses and flock to our relief works in years of famine. A part of the class, comprising perhaps most of the navvies and workers in straw, is vagrant and moves away from a tract where distress is apprehended. But the great mass of the class is too poor and too unenterprising to migrate. The figures probably do not represent the normal distribution of the class, partly because of the double meaning of the word coolie above alluded to, but still more because of the abnormal demand for this class of labour which existed in the Ráwalpindi and Pesháwar divisions at the time of the Census. But taking the Province as a whole the class constitutes six per cent. of the total and ten per cent. of the urban population, a very large proportion when applied to tens of millions.

740. The mercantile class.—The next group in Abstract No. 122, page 380, includes persons occupying very different positions. It comprises all grades of the mercantile classes from the banker of the cities through the shop-keeper of the villages to the wandering pedlar, though this last constitutes a wholly insignificant fraction of the whole. On the other hand the figures do not include the miscellaneous dealers who are scattered throughout the tables, as they could not have been separated without considerable labour, and their total number is by comparison inappreciable. The class as a class is eminently well off. Seasons of distress and failure of crops do, if greatly prolonged, affect the village shop-keeper; but as a rule he has little to fear from them. The class is certainly the most secure of all classes of the community, and the last that would need assistance in times of general want. The carrier class occupies a very different pecuniary position. Still as a whole it is not one of the classes which need cause anxiety to the administration in years of drought or famine. Trade may be backward at such times, but grain has to be imported, and distribution takes the place of collection. The class is probably doomed in great measure to die out with the extension of the railway system, for the donkeys of the village potter and the plough cattle when field-work is slack suffice for the greater part of the purely local carriage. The present figures show how scantily it is represented where railways have spread most largely. The large numbers returned from the Deraját are probably partly due to the *pawindah* traffic.

741. The unproductive class.—Last of all come the unproductive section of the community, so far

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Part I.—General and Comparative.

as our figures enable us to classify them. The grooms and others engaged about animals, and the domestic servants, are chiefly confined to towns where they are employed only by the wealthier classes, and they are fairly secure of their employment. Of the priests a considerable proportion own or cultivate land, while it is only in the most severe distress that their clients fail them and their ordinary income ceases. Still one of the most common forms which that income takes is a fixed share of the produce, and where nothing is reaped there is nothing to divide. The barbers are probably less secure of their fees, for so far as they do not take the form of a share of the outturn they depend in great measure upon weddings, and the first effect of scarcity is to put a stop to marrying and giving in marriage. The musicians and performers and the other professional classes, the teachers, doctors and the like, derive their subsistence chiefly from the wealthier classes, and are in some respects perhaps more independent of agricultural distress than others whose income is ordinarily larger. The beggars and *faqirs* include all the members of the religious orders, many of whom are well-to-do and even wealthy. But the great mass of the class consists of people who are really dependent upon alms begged from door to door, and with no other means of livelihood. The unproductive group as a whole is most largely represented in the most wealthy parts of the Province, and especially in the great cities.

742. The occupations of women.—The figures for the occupations of females are far less complete and far less trustworthy than are the corresponding figures for males. The directions laid down that an occupation was to be recorded for a woman, only when she assisted the males of her family in their calling or earned her living by a special occupation of her own, and that domestic occupations were not to be recorded. But, as Mr. T. W. Smyth remarks in his Census Report for Delhi, "some difficulty was experienced in obtaining information as to the occupations of women, as their male relations were reluctant to admit that the females of their families did anything but attend to their household duties. In rural villages the enumerators or supervisors were in the majority of cases personally acquainted with the different families, and incorrect information as to the occupation of women was easily checked and rectified." At the same time it is often exceedingly difficult to say whether any and what occupation should be returned for a woman. Almost every woman does a great deal of household work; a great majority of them probably help their husbands in their callings in some degree whether small or great; and it is almost impossible to draw a line and say where the latter occupation overshadows the former, and becomes of sufficient importance to be recorded. The difficulty will be exemplified in discussing the agricultural occupations of women. Of the total female population over 15 years of age separate occupations were recorded for the proportions shown in the margin. The proportion did not differ much in towns and villages, the respective figures for the Province being 243 and 238. Thus it will be seen that while not one-quarter of the women of over 15 years old have returned their occupations on the whole, over a half have done so in the Hissár division, and only one-tenth in the Lahore division. The sequence of the figures does probably represent in some degree the measure in which women are employed in occupations other than domestic in different parts of the Province; but the extraordinarily small return from the Lahore division cannot be accounted for except by the adoption of a very different standard from that followed in the neighbouring divisions. The domestic work which falls upon the woman-folk of a poor and numerous family is very considerable indeed, and unless there are several grown-up daughters or daughters-in-law it occupies their time very fully. They have the water to draw and the house to clean, the corn to grind, the bread to make, and the dinner to cook, the food to take to the men, and there is plenty of spinning to be done in what spare time remains. Yet it is notorious that women do assist very largely in some sorts of occupations and in some parts of the Province; and I fear that the record of female occupations as a whole must be looked upon as imperfect.

SPECIFIED OCCUPATIONS PER MILLE OF FEMALE POPULATION OVER 15 YEARS OLD.

Province	**238**	Lahore "	112

743. Errors in the record of female occupations.—There are three ways in which the figures might be expected to err. In the first place the women of the family might be recorded as following the same occupation as the men without reference to the question whether they really assisted them in the exercise of their calling; and where this had been done the tables would contain figures which would not really represent females occupied in the industries under which they were shown. There can be but little doubt that this has been done in some cases; indeed there are some entries, as for instance the 251 female *pandits* (occupation No. 50), which can hardly be explained on any other supposition. But a very careful and minute examination of the figures has led me to the conclusion that this error has occurred in a quite unexpectedly small number of cases, and that the entries due to it are wholly inappreciable in number. It will be seen in the second part of the chapter that even where the entry appears to be most improbable, a more careful examination often reveals the fact that there is some special branch of the calling within the female capacity, and that the women have been in part at least recorded as following that branch, thus leading us to suppose that the remainder were in all probability similarly engaged, though they entered the more general term in the schedules. The second probable error would be that women should return a purely domestic occupation in the schedules. There are few women who do not spin more or less; all but the richest cook the food of the family; among all but the wealthier classes or those who keep their females very strictly secluded the women ordinarily draw all the water for household purposes; while among the poorer classes and in many households which are not poor the women grind all the corn required for the day's consumption. These tasks are often very laborious: thus the Pathán women in the Marwat country often fetch their water from a distance of several miles. But so long as they are not performed for gain or hire, so long as the work is confined to the needs of the family circle, they are purely domestic occupations and should not have been entered in the schedules. Now a very large number of women of the poorer classes do make their living by spinning, cooking, drawing water, and grinding corn;

and the entries under these four occupations comprise nearly forty per cent. of the non-agricultural occupations returned for women. But if a woman returned her domestic work as an occupation she would almost certainly use one of these four expressions by which to describe it, and consequently we cannot be certain that some at least of the entries under these heads do not refer to domestic occupations which should not have been entered at all. The third form of error which is to be apprehended is that in which the woman, though really assisting the males of the family in their callings, has, whether from negligence or from a wish to make it appear that she is under no necessity to work for her living, had no occupation entered for her, thus implying that she is engaged wholly in domestic duties; and this has I fear been the case in very many instances.

744. The agricultural occupations of women.—It is a most difficult thing to decide what women should be returned as agriculturists, that is to say as actually assisting in cultivation. It is possible to distinguish four grades between the woman who never goes near her husband's field, and the woman who works in it almost as hard as he does himself. We have first the classes among whom the women are strictly secluded, and here of course they render no assistance whatever. But among all the classes who do not strictly seclude their women, and in the poorer families of even those classes who do ordinarily seclude their women, the wife almost invariably takes the midday meal to the men who are at work in the fields, and will commonly pick and carry back a few pot herbs for dinner or a little fresh grain for frumenty. The third grade is where the women, besides carrying the food, pick cotton and safflower, carry fodder, and do light field-work of all sorts, perhaps helping the reapers also at harvest. And finally there are classes among whom the women work if anything harder than the men, all the weeding and much of the hoeing being done by them, while ploughing and sowing, for which latter operation a woman is incapacitated by her sex, are the only two branches of agricultural labour in which they take no share [1]. The first and fourth classes are sufficiently well marked; but between them there is room for great variety of practice, and for no less difference of opinion as to what degree of assistance rendered would justify a woman in recording her occupation as agricultural.

745. Now the practice of the women in this respect is very largely a matter of tribal custom, their abstention from field-work being looked upon as in some respects a mark of higher social status. But it is not wholly regulated by such custom; and while poverty will sometimes compel women who from their caste would not be expected to work in the fields to do so, it is still more commonly the case that social pride and pretensions induce sections of those castes whose women ordinarily do field-work of all sorts to affect the exclusiveness of the higher castes. And the practice varies from one part of the Province to another, and in some parts from tribe to tribe of the same caste, from village to village of the same tribe, and even from family to family of the same village. In the eastern and south-eastern districts the practice is fairly uniform. The women of Jats and Rors, and of Kambohs, Aráins, and similar minor agricultural tribes, work regularly with the men in the fields; the women of the richer Bráhmans, Tagas, Saiyads, and Rájpúts do not go into the fields at all; while those of the poorer families of these castes and of all Gújars merely do light field-work, and even that not as a daily occupation. In the hills the women of all but Bráhmans and Rájpúts work in the fields, while in the higher Himálayas almost the whole of the field-work, not always excepting ploughing, is done by the women, the men working meanwhile as carriers, coolies, and the like. On the frontier the Pathán women work very generally in the fields, but not as a rule till they are some 25 years old, and then only at the lighter kinds of labour and at harvest time. Throughout the greater part of the Province the women of the Aráins, Sainis, Mális, and similar inferior castes work with their husbands in the fields; but in the Western Plains even these women, and still more those of the higher classes, take very little part in agriculture. Finally in the central and Sikh tracts and in the adjoining sub-montane, while the women of Gújars do light field work, those of Jats hardly ever help in the cultivation. When Mr. Elliott who came from the North-West Provinces, and I who knew only the Jamna districts, went through the Panjáb on a tour of inspection, we could hardly believe it possible that the women of Jat households should not ordinarily be recorded as assisting in agriculture. But there is no doubt of the fact that, unlike their sisters of Hindústán whose agricultural industry has become proverbial, the Jat women of the Panjáb proper do not ordinarily assist their men in the work of cultivation. The difference is doubtless due to the far higher social and political status enjoyed by the Jat in the stronghold of the Sikh Khálsa than in parts where other tribes occupy a dominant position.

746. The variety of practice being so great and the gradations so many, and there being, as Mr. Kensington puts it in writing of Hushyárpur, "a natural delicacy in admitting that the women work in "the fields," it is hardly to be expected that our record of female agriculturists should be even approximately complete, or that the figures should have any very definite significance. And besides the wives of the husbandmen themselves, all the women of the village menial class almost without exception do field-work for hire at seasons, such as harvest time, when the work must be done quickly and extra labour is needed; while where the better class of women take no part in the cultivation, the whole of the cotton and safflower picking and of such weeding as is done at all, is done by these menial women for payment. Thus while this class of females perform on the whole a very considerable amount of agricultural labour, it can hardly be said that they are cultivators by occupation, for it is only at certain seasons that their services are required.

747. Distribution of female cultivators.—Abstract No. 125 on the next page shows the distribution by occupation of those women for whom occupations have been recorded, the figures being proportions per thousand of the total specified female occupations.

[1] Mr. Wilson notes that he has seen a woman pouring the seed into the tube of the drill, while her husband drove the plough; and that in Sirsa he has known women to be yoked in the plough to draw it.

Part I.—General and Comparative.

The figures are not very instructive, owing to the varying proportions of the total female population for whom occupations have been returned in the several divisions (see section 742). On the other hand if I had calculated the percentages on the total female population of over 15 years of age, many of the occupations would have disappeared altogether, as they would not have amounted to one in a thousand. I give in the margin the proportions per mille of the total population over 15 years of age who have been returned as cultivators. The corresponding figures for towns are 23 and for villages 108 in the Province taken as a whole. Thus it will be seen that so far as the figures can be accepted, while something under 10 per cent. of the whole female population who are of age to work follow agriculture as a calling, nearly forty per cent. of those who have any occupation at all other than domestic are cultivators. In the Hissár division 100 out of every 264 adult women work in the fields, while in the Lahore division only one in 200 is returned as a cultivator. I suspect that the former figures are slightly and the latter very largely below the truth. But it is probable that the sequence of the divisions is very nearly in accordance with the facts, and that the proportion of females who do field work is largest in the eastern and south-eastern districts, next largest in the hills and sub-montane, then in the Salt-range Tract, still smaller in the central and frontier districts, and smallest of all in the districts of the Western Plains.

PROPORTION OF FEMALE AGRICULTURISTS PER MILLE OF TOTAL FEMALE POPULATION OVER 15 YEARS OLD.

748. Non-agricultural occupations of females.—The extraordinary variation in the numbers of female cultivators returned from the several divisions renders any comparison between the figures for other occupations shown in Abstract No. 125 for the various divisions almost meaningless. Since 50 per cent. of the whole are agricultural in the Dehli and only 5 per cent. in the Lahore division, the figures for an occupation which bore the same proportion in both divisions to the total of non-agricultural occupations would be by mere arithmetical consequence nearly double in the latter what they would be in the former; and I have just explained why proportions to total population would be unsatisfactory. The occupations of women are noticed in detail under their several headings in the second part of this chapter, and I shall here do nothing more than briefly note their distribution in the Province taking it as a whole. In summing up the distribution of occupations in section 752, I shall give the proportions which the main groups of female occupations bear to the total adult female population.

The occupations may be roughly classed under two heads, those in which the women simply assist their fathers and husbands in their work, and those which are female occupations proper where the whole work is done by the women. Of course it is not always possible to class any given occupation wholly under either head. To the first kind of occupations belong all the female cultivators, who constitute some 40 per cent. of the whole. It may be that a certain number of women have been wrongly returned as landowners who do not cultivate themselves, but this error has probably been rare. A woman cultivating on her own account, that is to say unassisted by men, is I believe quite unknown in the Panjáb unless it be in the higher hills. Under this head fall also the workers in leather, who probably help in curing and dyeing leather and perhaps in the lighter kinds of sewing. The women returned as blacksmiths probably do little more than blow the bellows, and their number is small; though the women of the vagrant or Gádiya Lohárs commonly wield the forehammer. The female potters perhaps mould the clay, while the female oil-pressers may drive the bullocks. The total of these classes is under 5 per cent. of the whole, and it is probable that in some cases at any rate the women have been shown as following the occupation of their husbands through carelessness, rather than because they really assist them in their calling. The female weavers comprise 6½ per cent. of the total, and the numbers are, as noted by several Deputy Commissioners, probably very much below the truth. The women of the weaver classes prepare the web and fill the spools ready for the weavers' hand, and are an important element in the industry; though perhaps but a small number are wholly occupied in these occupations. The female cotton scutchers are chiefly occupied in rolling into rolls ready for spinning the cotton scutched by their husbands. Thus the women who merely help the men constitute almost exactly the half of the total women whose occupation is recorded, about 40 per cent. being cultivators and 10 per cent. artisans. These women follow the fortunes of their families, and thrive or starve with them.

749. But the women who follow occupations which can be wholly performed by females, while perhaps in the majority of instances they have husbands or sons whose income they help to increase, are in very many cases, and especially in the cities, poor widows or forlorn women who have nothing but their own labour to depend upon and who often find the greatest difficulty in earning a bare subsistence. These women very generally employ themselves in spinning cotton and grinding corn, especially if they belong to the higher castes, as these are in-door occupations, and in working as coolies if they belong to classes who are not secluded. The cotton spinners form 13, the corn-grinders 6½, and the coolies 3½ per cent. of the whole; though as before remarked corn-grinding and cotton-spinning, like water-carrying and cooking, may in some cases have been wrongly returned as generic terms for mere domestic duties.

There remains about 25 per cent. of the female occupations to be accounted for. The water-carriers, cooks, scavengers, and washerwomen form 11 per cent. of the whole. These women are very generally employed to bring water, remove night-soil, and wash clothes in houses where the females are strictly secluded; while the cooks are in some cases domestic servants, but more commonly keep public bakeries and cook for the village. In the villages they are perhaps generally village menials receiving customary dues, often taking the form of a fixed share of the produce; but elsewhere they depend upon the wealthier classes for their income, which though scanty is tolerably secure. The female money-lenders are probably women who have either been returned wrongly as following the occupation of their husbands, or who own capital and lend it through agents; but nearly half the female mercantile class consists of petty hawkers and pedlars, who like the greengrocers and costermongers are generally miserably poor. These two

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

last classes comprise 1½ per cent. of the whole. The domestic servants occupy a fairly secure position. The female priests and barbers are women who have inherited the right to receive fees from clients, or, in the case of the barbers, who cut hair and perform similar services for females. These women, and the musicians, dancers, and performers, derive their income from the same sources and in the same manner as do men following the same occupations, and the four classes constitute 3½ per cent. of the total, while miscellaneous industries and professions account for 2 per cent. more. Something more than one per cent. of the women are employed as embroiderers and sempstresses, and are generally exceedingly poor, working for large employers who pay them at the lowest possible rates. The same number employ themselves in collecting cow-dung, grass, and fuel, and in making articles of reeds and straw; many of them are vagrants, many more are indistinguishable from the coolie class, and the livelihood of all is precarious in the extreme. Finally we have the class of beggars and *faqírs* who comprise about 4½ per cent. of the whole number returned, and many of whom are wholly dependent upon the alms of the charitable.

750. Occupations of children.—In a country where education is almost unknown to the masses, and where more than half the population is engaged in agricultural and pastoral pursuits, it may be imagined that the children are employed in such manner as suits their capacity at an exceedingly early age. In all but the wealthier families among the husbandmen of the villages, the boys go with the cattle to the jungles as soon as they are able to take care of themselves, while they are also largely employed in driving well bullocks, weeding, and similar work. Among the poorer menial classes the girls are set to gather cowdung and fuel, while both boys and girls assist their parents in a thousand small matters. In the towns children are more often sent to school and less often kept to work, except among the poorest classes. The instructions directed that no occupation was to be returned for any girls, or for such boys as were not "of an age to do work." But, as already pointed out, these instructions were not always followed, even infants in arms being occasionally shown as following the same occupation as their fathers. Young children under 6 years of age were in great measure excluded from tabulation, and the figures of Abstract No. 126 show the proportion which boys between the ages of 6 and 15 years bear to the total number above 6 years old returned as following each class of occupation. The classification of the final tables has been followed as it stands.

Abstract No. 126, *showing the proportion of* Male Children *to total of all Ages* following each Class of Occupation.

PROPORTION OF MALES UNDER 15 YEARS OF AGE PER MILLE OF TOTAL MALES.

No. of Class or Order.	Names or Class or Order.	Towns.	Villages.	Total.	No. of Class or Order.

7	Carriers, &c. . . .	28	51	45	7
8	Agricultural and Pastoral .	64	84	83	8
9	Engaged about animals .	27	76	53	9
10	Mechanics	38	53	45	10
11	Workers in fabrics and dress .	59	56	55	11
12	„ „ food and drinks .	38	43	41	12
13	„ „ animal substances .	73	72	71	13
14	„ „ vegetable „ .	56	64	63	14
15	„ „ minerals . .	47	52	52	15
16	General labourers . .	56	76	70	16
17	Persons of rank and property .	98	64	68	17
18	Beggars, &c. . . .	66	98	91	18

The proportion is smallest among Government servants and the mercantile and carrying classes. Excluding beggars, and the assignees of Government revenue (order 17) who are small in number, and the entries under which represent source of income and not occupation, the largest proportion is in the agricultural class, especially in the villages. Indeed of the 543,487 boys for whom occupations are returned, 347,361 or 64 per cent. are shown as engaged in agricultural and pastoral pursuits, and for the most part as cowherds and shepherds. Of the remaining 200,000 boys 13 per cent. are employed as village menials, 12 per cent. in weaving and the like, 10 per cent. as workers in dress, 6 per cent. in grinding corn, 8 per cent. in collecting wood and dung and working in straw, 4 per cent. as blacksmiths and potters, 12 per cent. as coolies, 15 per cent. as beggars, 3 per cent. as priests, and 2 per cent. as carriers. Among the industrial classes the proportion of children is considerable, but it is doubtful how far they really assist in the actual operations of the several crafts. In the coolie class the boys do really help in the work, filling and carrying the baskets of earth from the excavation to the spoil bank, or driving the donkeys which carry the spoil; while among the beggars where the proportion is highest of all, they are invaluable as appeals to the charitable. Of the 96,511 girls under 15 years old for whom occupations are returned, 44 per cent. are engaged in agriculture, 11 per cent. in domestic and menial occupations, 4 per cent. as grinding corn, 22 per cent. in weaving, spinning, and embroidery, 4 per cent. as coolies, and 9 per cent. as beggars. The significance of the figures is too uncertain to justify more detailed examination.

751. Summary of the distribution of the population by occupation.—Thus we have a male population of over 15 years of age for nearly the whole of which separate occupations have been returned. Of these 53·6 per cent. follow purely agricultural and pastoral pursuits, while 1·5 per cent. more according to the figures, but in reality a much larger proportion, combine cultivation with other occupations. The husbandmen proper comprise 30 per cent. who have a proprietary interest, and 19 per cent. who have tenancy holdings in the land, while 3 per cent. are in a position little better than that of day-labourers. In the villages the agriculturists number 60 per cent. of the whole, while they are in the east and centre of the Panjáb largely assisted by agricultural village menials who form another 7 per cent. of the village population.

Downloaded by Arbaz Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Part I.—General and Comparative.

Besides these cultivating menials, other village menials paid for the most part by receiving a share of the produce constitute another 6 per cent.; so that not less than 73 per cent. of the whole village population, and at the very least 16 per cent. of the town population, depend almost if not quite entirely for their subsistence upon the varying nature of the seasons and upon the produce of the fields. Of the remaining village population 3 per cent. are priests and professional men whose income also depends largely upon a favourable harvest, 5 per cent. belong to the mercantile and money-lending class whose livelihood is comparatively secure, 7 per cent. are artisans such as weavers and the like, whose income is always small but not directly dependent upon the seasons, though distress and high prices must always affect soonest the poorest classes, while 4 per cent. are coolies and day-labourers dependent for bare subsistence upon each day's chances, and another 4 per cent. are beggars and *faqírs*. Government and domestic service account for the remaining 3 per cent.

Of the adult male population of the towns 16 per cent. are purely agricultural and pastoral, while a considerable proportion of the menials in the smaller towns are paid according to the outturn of the harvest. Some 10½ per cent. belong to the mercantile, 2½ per cent. to the carrying, and 3 per cent. to the priestly and professional classes, all of whom are tolerably secure of their livelihood, as are most of the 4½ per cent. who work and deal in articles of food. Government and domestic service provide employment for 17½ per cent., while about 8 per cent are menials who are chiefly employed in serving the wealthier classes, and are not so wholly dependent as many others upon the fluctuations of trade and of the labour market. Ordinary artisans constitute 12½ per cent. of the whole, and are as a rule comfortably off according to their position in life, but the weaving classes who comprise 8 per cent. more are often miserably poor. The day labourers who are seldom certain of a day's food in advance constitute 10 per cent. of the whole urban population, while the *faqírs* and beggars amount to 4 per cent. more, leaving only 3½ per cent. unaccounted for.

752. Of the total female population over 15 years of age, 76 per cent. have had no occupations returned for them and must be supposed to be chiefly employed in domestic duties, though the numbers who are compelled to earn their own living either wholly or in part are probably much larger than would appear from these figures. In stating the composition of the remaining 24 per cent. of the adult female population I shall first give the percentages following each occupation calculated upon that 24 per cent. only, and shall add in brackets the corresponding percentage calculated upon the total adult female population. Of the women for whom occupations are recorded, 39½ per cent. (9·4) assist their husbands in cultivation, and 6 per cent. (1·4) in industrial occupations. Minor branches of the weaving trade employ 6½ per cent. (1·5) more, domestic service and attendance upon the wealthier classes occupy 11 per cent. (2·6) of the whole, while 3½ per cent. (0·8) follow professional pursuits. The remaining 33½ per cent. (8·0) of the female population of towns are miserably poor, and earn their bread by daily labour of the most uncertain kind, 15 per cent. (3·6) by spinning, 12½ per cent. (3·0) by general labour such as gathering cowdung, grass, or fuel, or working as common coolies, and 4½ per cent. (1·1) by begging.

The children of course share the fortunes of their parents. Those of the poorer classes are set to work as soon as they have the necessary intelligence, while the children of husbandmen tend cattle and perform similar light duties from a very early age. As they grow older the work becomes harder, till they enter into the full inheritance of that almost incessant though not always very arduous toil which is the lot of the immense majority of the population of the Panjáb.

753. Concluding remarks.—I am only too conscious how hasty and imperfect is the above sketch of the occupations of the people. But without the district figures it was impossible to enter into details; while even had they been available, the system of classification adopted has so obscured their meaning that it would hardly have been worth while to examine them very minutely. I have discussed the composition and significance of the figures under each heading of the tables with some fullness in the succeeding portion of this chapter, and I hope that with the aid of those remarks the figures will furnish such information as may be needed for general purposes of administration. But they will not serve the purpose of detailed inquiry into the constitution of particular industries, and I doubt whether any record of occupations made at a general Census in this country would suffice for such a purpose. In discussing the figures in Part II of the chapter, I have noticed many minor occupations which are interesting rather from their singular nature than because of their industrial importance. I have however given little or no information regarding the processes or appliances of the industries discussed. A great deal of most valuable matter will be found in Mr. Baden-Powell's *Panjáb Products* and *Panjáb Manufactures* and in Mr. Hoey's monograph on the *Trade and Manufactures of Northern India*. Some information regarding the grouping of occupations will be found in the chapter of this Report which deals with castes, and especially in the last part of that chapter. I have not attempted to institute any comparison between the figures of the last and those of the present Census; indeed any such comparison would be wholly impossible. In the first place the results were classified in 1868 on a somewhat different system from that now adopted, while there is not the slightest indication of how details were grouped, or whether any uniform system of grouping was followed; indeed the figures show conclusively that the want of uniformity was far greater than even that which our present figures display. But the chief reason which renders comparison impossible is that, whereas we show in our tables only the effective number engaged in the prosecution of each industry, the figures of 1868 represented the total number dependent for their living upon each industry, and included children of tender age, which our figures exclude.

50—60	66	164	176	62	,, 60	942	660	613	943
60—	58	340	387	57	Total	1,000	1,000	1,000	1,000

NOTE.—This table may be read thus: Out of every 1,000 males 121 (col. 2) are between 10 and 15 years of age. Out of every 1,000 blind males 53 (col. 3) are of that age. Out of every 1,000 females 105 (col. 5) are of that age. Out of every 1,000 blind females 38 (col. 4) are of that age. Out of every 1,000 males 640 (col. 7) are under 30 years old. Out of every 1,000 blind males 273 (col. 8) are under 30 years of age, and so forth.

The late stage of life at which blindness develops is very marked, more especially among females, and the figures for the several divisions exhibit a wonderful uniformity in this respect. Blindness in early life seems to be far more rare among females than among males; but after 40 years of age the proportion changes. The figures would appear to show that more than half the living blind are over 50 years of age.

DEAF-DUMBNESS.

826. Deaf-dumbness in various parts of the Panjab.—Table XVI of Appendices A and B gives statistics for the deaf and dumb. Enumerators were instructed to enter "only those who have been both "deaf and dumb from birth." The congenital nature of the affliction was perhaps not too carefully inquired into. But as the heading of the column was "deaf-dumb," it is to be hoped that those who were deaf only were seldom included; and I believe that dumbness other than congenital is not common. The examination of the figures made in section 829 shows that the statistics may be accepted as really including, as a rule at least, only the congenitally deaf and dumb. Abstract No. 137 below gives the number of deaf and dumb among every 10,000 of the population in each district and state. Unfortunately at the Census of 1868 those who were deaf and those who were dumb were recorded separately, and there is nothing to show whether those who were both deaf *and* dumb were included in both columns or not. But as the dumb are I believe almost universally deaf, I have taken the figures for the dumb as corresponding with those for deaf and dumb, and have given them by the side of my figures in columns 5 and 7, showing the figures for the deaf separately in columns 8 and 9.—

Abstract No. 137, *showing the number of* **Deaf and Dumb** *in* **1868 and 1881** *for* **Districts and States** *arranged in* **order of magnitude.**

Deaf-Dumbness.

Here again it is extraordinary how high the hilly and sub-montane states and districts stand. The only ones among them that are not above the average of the Province are Jahlam, Kohát, Bhajji, and Hazára; and in most of them the figures are enormously high. Of the plains districts, Sháhpur, Jhang, Muzaffargárh and Multán stand highest, while the Dehli division, Kapúrthala, Firozpur with Faridkot, Pesháwar and Hissár come lowest. The central districts stand in the middle of the list; but the difference between the average and the lowest figures is as nothing compared with those between the average and the highest. The proportion of deaf mutes among males is on the whole half as high again as among females, and this disproportion is observable in every single district and state. It is just possible that the male are less correct than the female figures; but I know no reason for suspecting that such is the case, and I believe that the figures represent an actual fact.

827. Figures for deaf-dumbness compared with those of last Census.—Dr. Bellew, who kindly examined these figures for me, compares the number now returned as deaf and dumb with the total of the separate returns of 1868 for deaf and for dumb. This comparison shows a very considerable decrease, and he writes:—

"The decrease has been in both sexes of the population, and clearly indicates that causes are at work which are diminishing "the extent of deaf-dumbness in this country. This infirmity, it must be remembered, is confined chiefly to the poorer classes who, "when prostrated with fever or any other sickness, are unable through poverty to procure for themselves the most simple and "inexpensive of remedies; but now that aid is being given to them by the medical authorities, and greater attention paid to the "sanitary condition of their towns and villages, it is probable that this infirmity will continue to decrease in a still more marked "degree."

I am not quite satisfied however that the comparison is a just one. I suspect that the column in the tables for 1868 headed "deaf" included many persons who were not dumb, and that our figures should more properly be compared with those only of the column headed "dumb." If this be done our figures show an increase of more than 50 per cent. among males and more than 100 per cent. among females. The meaning of the figures of last Census is so uncertain that it is not worth while to go into the comparison more closely.

828. Deaf-dumbness among the several religions.—Abstract No. 138 below shows the number of deaf-mutes per 10,000 of each religion in each division of the Province, omitting very small figures:—

The figures are summarised in the margin. The proportion is much higher among Hindus than among Musalmáns, and smallest of all for Sikhs and Jains. But it is doubtful whether the difference depends upon religion so much as upon locality. It will be noticed from Abstract No. 138 that, speaking generally, and excepting cases where the numbers concerned are very small, the proportion is generally largest in each division for the dominant religion, at any rate as regards Hindus and Musalmáns; and great prevalence of deaf-dumbness in the hills naturally raises the figures for Hindus. Why those for Sikhs should in all cases be so small I do not understand; unless it be that, as Dr. Bellew says, deaf-dumbness is often due to low living and poverty, which would explain the fact, for the Sikhs are probably, taking them as a whole, in more comfortable circumstances than any other class of the community except the Jains.

NOTE.—This table may be read thus: Out of every 1,000 males 121 (col. 2) are between 10 and 15 years of age. Out of every 1,000 deaf and dumb males 140 (col. 3) are of that age. Out of every 1,000 females 105 (col. 5) are of that age. Out of every 1,000 deaf and dumb females 153 (col. 4) are of that age. Out of every 1,000 males 640 (col. 7) are under 30 years old. Out of every 1,000 deaf and dumb males 599 (col. 8) are under 30 years of age, and so forth.

Now here we have at once a test which will show us how far our figures really include only congenital deaf-mutes. If they include none but those who were deaf and dumb from birth, the percentages of the deaf and dumb population for each age will vary from those for total population, only by such inconsiderable differences as might be caused by diversity in the respective death-rates of the two populations; and if, as it is fair to suppose, a native can hardly tell whether a child is deaf and dumb during the first few years of his life, yet the question must be solved at least by the time the child is 10 years old; so that the omission of deaf-mutes under 10 years of age should make the percentages for higher ages in columns 3 and 4 somewhat higher than they ought to be. Now considering the vague nature of the native ideas of age, I think the correspondence between the two sets of figures for age and deaf-dumbness in columns 2, 3, 4 and 5 of the table above is little short of extraordinary. The number of deaf-mutes for under 5 years is much too small, and that for males between 5 and 10 a little too small; and this is due to the omission of young children whom their parents were unwilling to set down in their own minds as permanently deaf and dumb while there was yet a hope of their speaking. And this omission raises all the other deaf and dumb percentages unduly. The correspondence is, as I say, very striking, and proves most clearly that we have succeeded almost entirely in excluding the merely deaf from our tables. The percentages for the last period of life are too high; and it is probable that a few old people who have grown hard of hearing from sheer age have been included; but the proportion they bear to the total number is wholly insignificant.

LEPROSY.

830. Leprosy in various parts of the Panjab.—Table XVII of Appendices A and B gives the statistics for lepers. Here again enumerators were told to enter as lepers "only those who suffer from real leprosy (*jusám* or *kohr*), not those who have mere discoloration of the skin (*phúlbahrí*)." But I believe that it is by no means easy in all cases for even a medical man to distinguish true leprosy from some of the skin diseases which imitate it most closely, and especially in its earlier stages; and there can be little doubt that the figures include many cases which are not really cases of leprosy at all. So far as intentional concealment goes, I doubt whether it has affected the figures. Leprosy appears to be almost confined to the lower classes, and

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Leprosy.

as Mr. Wilson says, the cases are notorious to all. But in one respect the figures are misleading. There are leper asylums in certain districts of the Panjáb, and their patients are not wholly drawn from the districts in which these asylums lie, so that the existence of the asylums will unduly raise the numbers of lepers in those districts. I give the figures for 1880-81 in the margin. Besides this there is in the Jhang district a shrine of Pír Jahánia who is supposed to have the power of curing leprosy, at which the lepers of the countryside collect from some distance round and wait patiently, often for years, in the hope of a cure. Abstract No. 140 below gives the numbers of lepers per 10,000 of total population for each district and state, and also shows the corresponding figures of 1868 side by side with those of 1881 :—

The order of districts is very marked. We have, almost without a break, first the hills, then the sub-montane districts, then the Eastern Plains, and last of all the Western Plains. I do not know what doctors assign as the cause of leprosy. But there is one idea suggested to me by the order of the districts, which would be easily tested by classification of known cases of leprosy according to caste. The districts are roughly speaking arranged in this list in order, with respect to the number of the carrion-eating castes among the population. Is it possible that the feeding on dead animals and such beasts as jackals and foxes has anything to do with the disease? I believe that syphilis is sometimes assigned as the cause of leprosy, and this would explain the high place that the Hill districts hold in the list. But if this were the true cause we should expect to find more lepers among the Musalmáns than among the Hindus, the former being markedly more addicted to venery than the latter, and far more in the towns than in the villages; whereas exactly the reverse is the case. If my suggestion be correct both facts would be explained, as the outcast classes have for the most part been classed as Hindu, and they are not only more numerous in the villages than in the towns, but eat carrion more largely in the former than in the latter. Of course it may be the poverty and dirt in which these people live, rather than the nature of their food, that produces leprosy, if it be true, as I understand it is, that lepers generally belong to the lowest classes. The proportion of lepers is more than two and a half times as great among males as among females, and the disproportion is constant throughout the list; and this would appear to point to syphilis as the more probable explanation.

831. Figures for leprosy compared with those of last Census.—The figures show a very large decrease since 1868, both among males and among females, and the decrease is observable in every district.

Downloaded by Aniket Alam (International Institute of Information Technology, Hyderabad) on 09 Sep 2017 at 02:18:00

Leprosy.

It may represent a real decrease in the disease; or it may be due to the more careful discrimination at the present Census of real leprosy from mere dermal discoloration.

832. Leprosy among the several religions.—Abstract No. 141 below shows the number of lepers per 10,000 of each religion in each division of the Province, omitting very small figures.

The results are summarised in the margin. The differences are apparently not wholly due to locality, as they are not constant throughout the divisions. Again the Sikhs are at the bottom of the list throughout the Province. Now the proportion of carrion-eaters among the Sikhs is exceedingly small, while among Hindus as classed for Census purposes it is exceedingly large as a rule. On the other hand in the western divisions the Hindus are almost wholly commercial, and include no carrion-eaters. The figures of Abstract No. 141 seem to lend some slight support to the suggestion made in section 830.

833. Leprosy at the several ages.—Abstract No. 142 below shows the distribution by age of every 1,000 lepers in each division of the Province.

Leprosy.

The results are summarised below in the manner already explained in section 821 :—

1	2	3	4	5	6	7	8	9	10
	Males.		Females.			Males.		Females.	
Limits of Age.	Figures for Age.	Figures for Lepers.		Figures for Age.	Limits of Age.	Figures for Age.	Figures for Lepers.		Figures for Age.
0—5	123	4	4	138	Under 5	123	4	4	138
5—10	137	13	20	137	,, 10	260	17	24	275
10—15	121	28	38	105	,, 15	381	45	62	380
15—20	89	53	68	85	,, 20	470	98	130	465
0—10	260	17	24	275	,, 10	260	17	24	275
10—20	210	81	106	190	,, 20	470	98	130	465
20—30	170	148	141	179	,, 30	640	246	271	644
30—40	136	215	192	136	,, 40	776	461	463	780
40—50	100	224	214	101	,, 50	876	685	677	881
50—60	66	170	165	62	,, 60	942	855	842	943
60—	58	145	158	57	Total .	1,000	1,000	1,000	1,000

This table may be read thus: Out of every 1,000 males 121 (col. 2) are between 10 and 15 years of age. Out of every 1,000 leprous males 28 (col. 3) are of that age. Out of every 1,000 females 105 (col. 5) are of that age. Out of every 1,000 leprous females 38 (col. 4) are of that age. Out of every 1,000 males 640 (col. 7) are under 30 years old. Out of every 1,000 leprous males 246 (col. 8) are under 30 years of age; and so forth.

The figures show very clearly that leprosy is almost unknown in the earlier stages of life, that it seldom develops before 20 years of age, and generally very much later. It does not appear to shorten life so far as we can judge from these figures. Nearly a third of the whole lepers of either sex are returned as over 50 years old. The figures for the Multán and Deraját divisions however form striking exceptions to this general rule.
